Other bills introduced are the Eagleton bill, to prohibit the use of any motor vehicle of more than 20 horsepower for other than speed tests and races; Eagleton's bill to give persons injured by a motor vehicle a lien on the vehicle for the amount of the judgment secured by reason of such injury; the A. E. Smith bill, to tax motor vehicles according to their seating capacities, and Senator Grady's bill, for the protection of persons on highways, which seeks to provide that "All lawfully disposed persons have an equal right to be upon, use and traverse the public highways, roads, streets, avenues and places in this State, and no person has a right to drive or ride thereon at a rate of speed dangerous to others.

There will be a hearing on Wednesday of this week before the Assembly general laws committee on the Yale bill to repeal that section of the motor vehicle law which now permits supervisors and other local authorities to set aside a portion of the highway for auto races. Attorney Terry was ready to argue on the bill last week, but Mr. Yale had arranged to put it over a week, and said then he would bring up a delegation to favor the bill. It is understood that a delegation of Long Islanders, headed by Congressman Cocks, will appear to favor it, with certain persons from Westchester and Putnam counties.

MARCH MEETING OF THE A. S. M. E.

The March meeting of the American Society of Mechanical Engineers will be held on Tuesday evening, March 10, in the Engineering Societies building. The meeting will be addressed by Dr. Charles P. Steinmetz, who is a member of the A. S. M. E. and a past president of the American Institute of Electrical Engineers. His subject will be "The Steam Path of the Steam Turbine."

NEW JERSEY IS HAVING A SUCCESSFUL SHOW

NEWARK, N. J., Feb. 26.—Though so crowded for space that almost every dealer was reduced to exhibiting but one model of any make, Newark's first automobile show in the Electric Park auditorium had all the features that make for popularity and success. When Mayor Haussling, of Newark, and Mayor Shoenthal, of Orange, pronounced the

tomobilists and leaders of the clubs and associations in the New Jersey and the Metropolitan district. Though many of the clubmen arrived in their own automobiles from distant points, there was no difficulty in housing the cars, the grounds surrounding the auditorium forming an excellent open-air garage. Society is to have its exclusive innings Thursday night.

As a stimulator of interest in automobiling and an aid to spring buying, the Newark eight-day show came up to all expectations. Between the few who thought the venture too modest and the still smaller number deprecating any exhibition, there was a solid group of dealers who realized that a late winter show would help along spring sales and stimulate activity generally, and they were in no way disappointed.

Prominent among the inside attractions is a cinematograph exhibition every evening at 9 o'clock, the moving pictures representing Vanderbilt Cup races and other automobile events being shown on a screen let down in the center of the hall and visible from both sides. A musical program is given afternoon and evening of each day.

As a convenience to residents in the Oranges and at the same time as an automobile demonstration,

twelve White steamers carry passengers to the Electric Park at intervals of half an hour, from 2 to 11 P. M. Their starting points are the Brick Church and East Orange stations of the Lackawanna, and from Main and Day streets, Orange.

Thirty-one different makes of automobiles are exhibited by twenty-two dealers, the number of cars on exhibition being about fifty. In addition a full line of accessories are shown by all the more prominent local dealers. The car exhibitors

ELECTRIC PARK AUDITORIUM, WHERE NEWARK HELD ITS FIRST AUTO SHOW.

official opening speeches on Friday evening, February 21, the auditorium was a tastefully decorated hall of white and gold, with every car in its place and so crowded with spectators as to prove conclusively that the New Jersey Automobile and Motor Club and the New Jersey Automobile Trade Association would have been justified in securing a larger hall had one been available. Mayor Cardwell, of East Orange, who had arranged to be present at the opening ceremony, missed the White steamer sent to bring him to the auditorium, with the result that he was compelled to board the trolley car and enter the hall later in the evening. At that time the crowd was so great that the management had serious thoughts of closing the doors. In addition to the three mayors, a strong force of city officials and prominent automobilists attended on the opening night, the total attendance for that evening being 5,000, according to official figures. Though slightly less on the succeeding evenings, there was never anything approaching a dearth of visitors, and according to the reports of exhibiting dealers business is always of a satisfactory nature.

Tuesday evening being "Club night," delegations from Englewood, Paterson, New Brunswick, Plainfield, Trenton, Camden, Cape May, Jersey City and other points filled the hall with well-known au-

HOW THE CARS WERE STAGED IN A SETTING OF WHITE, GOLD AND NATIONAL FLAGS.

include practically all the important dealers of Newark and district, and are in quite a number of cases supported by some part of the staff from the factories they represent. The cars range from modest single-cylinder doctors' runabouts and equally modest buggyabouts to handsome six-cylinder automobiles with limousine body. The complete list of car exhibitors, with the cars they are showing, is as follows:

EXHIBITOR.	CAR.
A. G. Spalding & Bros.	Stevens-Duryea
Allen-Kingston Motor Car Co.	Allen-Kingston
Brush-McLaren Motor Co.	Brush and F. N. Motorcycle
Calvert-Zuel Co.	Winton
Carl Page Co.	Peerless
Chas. S. Cooper	Atlas
Ellis Motor Car Co.	Pierce Great Arrow and Knox
Essex Auto Co.	Jackson
Garford Motor Car Co.	Garford
Greene Motor Car Co.	Locomobile, Oldamobile
H. J. Koehler	Buick and Waltham
Hygrade Motor Car Co.	Ford
J. W. Mason	Maxwell and Stoddard-Dayton
Mitchell Auto Co. of N. J.	Mitchell
Motor Car Co. of N. J.	Packard, Autocar, Cadillac, Northern
Osborne & Morton	Auburn
P. H. Johnston	Grout
Rickey Machine Co.	Marmon
Sheldon W. Case	Holman
Star Motor Car Co.	Pullman and Napier
The White Company	White
W. S. Maltby	Corbin

The "New Jersey Automobile Exhibition" is the name of the definite company under whose auspices the show is being held, its make-up containing President Angus Sinclair, Secretary H. A. Bonnell, and ex-Presidents Joseph H. Wood and James R. English, of the Automobile Club, and R. A. Greene, J. W. Mason, and W. H. Ellis, from the Trade Association, with George Paddock, president of the Trade Association, also being president of the company. W. F. Kimber is legal adviser.

FRANKLIN MAKES A WINTER RECORD.

CINCINNATI, Feb. 24.—An eleven-day run over Ohio and Kentucky roads under rigorous non-stop conditions would be a creditable performance under any circumstances, but to demonstrate that the Franklin air-cooled car was equal to any conditions, no matter how bad, the Sid Black Automobile Company, Franklin agents in this city, started a Franklin 28-horsepower Model D car on a non-stop, mileage and economy test on February 11. On that day and the two following the car made successive trips to Columbus and return, the state of the roads being almost inconceivable as it was then at the close of a week's rain. Trips were also made to Lexington and Hamilton, Ky., during the most severe winter weather. Sid Black, C. A. Robinson, John Burns and V. Higgins took turns at the wheel, each handling the car for a six-hour shift, while two observers were carried at all times. At the conclusion of the test the engine had been running constantly for 11 days, or 264 hours, during which time the car had covered 2,152 miles.

N. Y. AUTO RACING OPPOSITION EXPIRES.

ALBANY, N. Y., Feb. 26.—The Yale bill to repeal the section of the Motor Vehicle law permitting road races is dead. The hearing to-day was adjourned indefinitely by the general laws committee. Charles T. Terry, A. R. Pardington, F. H. Elliott, M. T. Bender, O. A. Quayle and C. D. Hakes, of the American Automobile Association, were present to oppose the measure. Assemblyman Yale will abandon his bill.

The Bashford bill before the committee, amending the automobile law generally, is also dead.

The delegation here to-day also appeared before the codes committee in opposition to the McGrath bill to compel autoists to stop and wait to be arrested or be guilty of a misdemeanor.

A. A. A. DOES SAME WORK AT LOWER PRICE.

In view of the fact that clubs belonging to the A. A. A. only pay \$1 per year per member, of which 75 cents goes to the State association and only 25 cents to the national body, and the annual fee for non-club members is only \$2, it would seem that automobilists generally will continue to obtain their touring information, books, maps, etc., from the A. A. A. rather than make any grand rush to become "subscribers" of the bureau of tours of the A. C. A. at \$10 per year. This is the comment of Arthur N. Jervis in the *New York Mail*:

"Considerable curiosity is cropping up as to the motive behind the new plan of the Automobile Club of America, which has just been announced. Although it is said that the club has no thought at present of forming a separate association, the decision to organize a floating membership into a sort of loosely affiliated or supplementary body on the lines of the Touring Club of France has suggested to some that the A. C. A. plans an organization to obtain, classify and dispense touring information after the methods in vogue in Europe. Such a body would necessarily be a rival in the field to the American Automobile Association, which now does this for its members, and at a much lower cost for membership than the \$10 a year which the A. C. A. proposes to charge the subscribers to its 'bureau of tours.'

"The A. A. A. has a touring board that dispenses information about tours here or abroad free to its members. This work has been growing rapidly, and is now one of the most important branches of A. A. A. activity. It would take a long time for any other body to get a touring bureau organized in the fine working order that the A. A. A. has its department. The A. A. A. has the recognition of the foreign organizations, as well as the A. C. A., but a rivalry between the two would not contribute to the prestige of American automobilists going abroad."

SCRANTON WILL ENFORCE LAW ON SIGNS.

SCRANTON, PA., Feb. 24.—Through its attorney, Hugh B. Andrews, the Automobile Association of Scranton has served notice on the road supervisors and constables of Lackawanna county that the law dealing with sign boards and loose stones must be rigorously enforced. Under the act of June 18, 1886, the supervisors are compelled to erect sign posts at the intersection of all public roads within their respective townships, the penalty for neglect or refusal to do so after ten days' personal notice being \$20 in each case. Under the act of July 2, 1901, Township supervisors and road commissioners are responsible for the removal of loose stones from the highways at least once a month during May, June, August and October. Penalty for neglect or refusal to carry out the provision of the act is \$10, to be recovered by action of debt in the name of the Commonwealth.

FIRE WILL NOT DELAY STODDARD-DAYTON.

DAYTON, O., Feb. 26.—Last Friday morning, February 21, a destructive fire broke out in the trimming room of the Dayton Motor Car Company's big plant. The fourth floor of the new six-story concrete building was gutted, the fourth and fifth floors of the office building entirely destroyed, and the first three floors of the same building soaked with water.

When the fire had been subdued so that the fire department could control it, H. J. Edwards, chief engineer of the concern, with R. T. Houk, superintendent of the plant, were busy planning for the work of the morning. The moment the water was shut off, an army of workmen started the work of clearing away the debris, and while the fire engines were still on the scene letters were going out to the agents telling them to be of good cheer. J. W. Stoddard, president of the company, who does not know the meaning of the word defeat, was on the scene early and personally directed the reorganization and went home only after having given his instructions to the different departments.

On Monday morning, forty-eight hours after the fire, every man of the force was back at his work. Men who do things surround J. W. and C. G. Stoddard.

PACKARD TESTERS UTILIZING THE ICE-COVERED SURFACE OF LAKE ST. CLAIR—TURNING POINT IN IMPROMPTU RACE.

CAR TESTING ON SNOW-BLANKETED ST. CLAIR.

DETROIT, Feb. 24.—While the ice boats lay buried and frozen in the deep snow which covered Lake St. Clair from shore to shore and Detroit was snowbound, with its suburban traffic halted, limited passenger trains being dug out of drifts and freight trains abandoned, a dozen automobiles last week raced and chased through the unbroken drifts on the broad sheet of ice. As black specks on the horizon swept toward the shore, throwing a great cloud of snow high behind them, they became recognizable as a squadron of "Wild Bill" Birmingham's army of Packard testers, while the gray run-about, racing with Sales Manager Waldron's touring car, was piloted by Manager Joy. The Packard Motor Car Company had been for weeks using the old-fashioned winter to advantage in the testing of cars through snowdrifts and up and down icy, snow-shrouded hillsides. The administration, engineering and testing departments had been busy for days driving cars through the snow-clogged thoroughfares leading out of Detroit. The last heavy storm spread a thick blanket over the lake and made it an ideal place for fast running over a broken track, for plugging through drifts and for general and unhindered wintertime testing. Hence the immediate inauguration of Lake St. Clair as a new testing rendezvous by the Packard folks. The lake is so solidly frozen that it is possible to drive all over it, although on account of snow-covered cracks it is not safe to drive from shore to shore without a local guide who is familiar with the location of the dangerous places. The photograph shows an impromptu race between the testers at the point where one of the turns is made.

PACKARD MAY ACQUIRE HARTFORD PLANT.

HARTFORD, CONN., Feb. 24.—It is reported in automobile circles in this city that there is a likelihood of the plant of the defunct Electric Vehicle Company being acquired by the Packard Motor Car Company of Detroit. It is a matter of common knowledge that the sales of Packard cars in the East are very large, and it is rumored that the object of the company in taking over the plant in question would be to establish an Eastern department. It is also well known that the Packard Company suffered less during the recent financial stringency than the majority of its competitors and that it is in an excellent position to finance the acquisition of the Hartford plant, should this be deemed advisable. On this account the report is receiving considerable credence here.

RAPID COMPANY DECLARES DIVIDEND.

PONTIAC, MICH., Feb. 24.—That the automobile industry did not suffer to as great an extent as many of its detractors would have the world believe, is evident by the fact that the Rapid Motor Vehicle Company, of this city, has just declared a 10 per cent. dividend on its stock, having had a most prosperous year during 1907. The officers of the company are A. G. North, president; Max Grabowsky, vice-president; H. G. Hamilton, treasurer and manager, and Morris Grabowsky, secretary. All are confident that the coming twelvemonth will see a volume of business fully equal to, if not greater than, that of the past year. Orders are plentiful at the factory and a full quota of help is employed.

TIRE PRIZES FOR BRIARCLIFF DRIVERS.

Further stimulus to effort on the part of the drivers who will take part in the Briarcliff Trophy race, is to be found in the recently announced offer of the Diamond Rubber Company, of cash prizes for winners on cars equipped with Diamond tires. For the first, \$500 is offered; second, \$350, and third, \$150. The specially trained tire crews of the Diamond company will be stationed along the course and will give their entire attention to the competing machines that are equipped with Diamond tires.

CADILLAC MODEL G AS MOTIVE POWER FOR SNOW PLOWS.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Hume Carriage Company, which was established in Amesbury, Mass., in 1857, and which makes a specialty of building high-grade limousine, landaulette, touring and runabout bodies, demi-limousine and cape tops, has removed its entire factory to 66 Stanhope street, Boston.

The official record of automobiles registered in New York State for the months of October, November and December, 1907, shows that the Renault leads all the rest of the foreign makes. During these three months more Renault cars were registered than the five next highest foreign cars combined. For the week ending February 8 more Renault cars were registered in New York State than all other foreign cars put together.

The Ormond-Daytona (Fla.) race meet, to be held the first week in March, is receiving generous support from the Continental Caoutchouc Company, makers of Continental tires. One of the prizes offered is \$200 in cash to the owner of the automobile winning the 300-mile race, provided, of course, the car is equipped with Continentals. Another offer relates to the 100-mile event, for which a special prize of \$100 is offered to the owner of the winning car, under the same conditions.

Everybody interested in the actual cost of running a high-grade car will have facts and figures to guide them when the Winton Company publishes the result of its \$2,500 contest for Six-Teen-Six drivers. The rules of the contest require monthly reports from all contestants and the figures are being compiled for public distribution as soon as the awards are announced. Any employed driver of a Six-Teen-Six is eligible to enter the contest. There are ten individual prizes ranging from \$100 up to \$1,000 in gold coin.

An increase in the sale of commercial vehicles is noticed throughout the country. The use of these motor cars is being extended and the manufacturers are looking for good business in this line. The H. H. Franklin Manufacturing Company delivered last week a 16-horsepower one-and-a-half ton truck to Philadelphia and one to Easton, Pa., and has orders for immediate delivery from Memphis, Tenn., New York, Denver and other points. The Model J Franklin trucks, which are constructed along the Franklin lines of light weight and air-cooling, each do the work of three horses at the Franklin factory.

Jason Silve, who drives the mammoth Warner autometer about the country, showing up the absurdity of the speed laws, started from Chicago for the Warner factory in Beloit, Wis., during the recent February blizzard. When he got as far as Elgin, Ill., he was compelled to stop and turn around. Time after time he was forced to get out and prop the huge instrument to prevent it from toppling over. This was rendered necessary from the fact that the instrument is 9 feet 6 inches in height and weighs 800 pounds, with the weight mostly at the top. The big autometer will be completely overhauled when it arrives at the factory, and will be ready for its second summer of touring.

Gabriel horns are finding favor with the crowned heads of Europe. Brown Brothers, the European agents, have recently sold one to Alfonso XIII., King of Spain,

for use on the royal auto, and a Gabriel has also found its way into the imperial garage at Berlin, where it graces one of the cars of the Emperor William. It was the birthday gift of his brother, Prince Henry of Prussia. The Emperor has ordered two more of his cars to be equipped with Gabriels. King Edward of England has had a Gabriel on his car for a couple of years, and the Czar of Russia has recently purchased one, as has also Dowager Queen Margherita of Italy. The inventor of the horn, C. H. Foster, has recently invented a shock absorber and given it the name of Gabriel.

A. L. Kull, sales manager and vice-president of the Dragon Motor Company, has returned from a Western trip to New York City and will remain there for a week or two before removing to Philadelphia for the spring. Mr. Kull states that he found trade improving in the West and a general feeling of hopefulness among manufacturers and dealers. One of the noticeable features was the demand in all the Western cities for taxicabs. There is a decided trend toward adopting the taxicab for street use in all American cities of any note, says Mr. Kull, and it appeared to him that it would be several years before this demand could be satisfied, no matter how industriously the various manufacturers now in the cab business worked at the task.

The Archer, Combs & Winter Company is the title of a newly organized corporation which has recently begun business in Portland, Ore., its headquarters being located at 306 Oak street. The officers are P. A. Combs, president and treasurer; A. J. Winters, vice-president, and Samuel B. Archer, secretary. The capital stock is \$20,000, fully paid in, and the corporation will make a specialty of handling automobile accessories, fishing tackle and sporting goods, doing a jobbing business entirely. The members of the new firm have a wide experience in these lines in Oregon, Washington and Idaho, having been identified with selling goods of this class at wholesale for a number of years. They control a number of specialties for the above territory as manufacturers' agents.

"We don't need a snow plow," said E. R. Thomas when asked as to the practicability of fitting a rotary plow to the front of America's defender in the big race. "Only in extreme cases is it necessary to use outside means to get the car through. Recently we ran a Flyer through from Buffalo to Boston, through the Berkshires, through snowstorms, snow drifts, ice and mud, and only twice resorted to shovels. Each time a very little work, merely clearing away the snow which had packed in front of the car, was sufficient. There is no doubt that a successful rotary snow plow could be designed by our engineers and the power of the motor is much more than sufficient to drive such an apparatus in addition to propelling the car. Such an arrangement might be of great service in extreme cases, but its service at such a time would not offset the disadvantage of carrying it when not needed. It is only in extreme cases that such an arrangement would be used, and we firmly believe that the Thomas Flyer is fully capable of overcoming all but most extraordinary conditions found on American roads."

NEW AGENCIES ESTABLISHED.

Cimiotti Brothers, 1843 Broadway, have taken up the sale of the York Pullman automobiles for the territory of Greater New York, Long Island and Westchester county.

J. H. Rogers, late of the Diamond Rubber Company, Chicago, and W. H. Roesch, formerly of Dawson Brothers, that city, have formed a partnership and taken the agency for the Wisconsin tire protector, manufactured by the Tire Protector Company, of Stevens Point, Wis. Their new offices are located at 1229 Michigan avenue, Chicago.

The Babcock Electric Carriage Company has met with such success with its New York branch, established last November, that it has decided to establish a branch in Chicago, which is located at 1328-1330 Michigan avenue, in the heart of the automobile trade district. C. M. Atterbury has been appointed manager.

PERSONAL TRADE MENTION.

B. F. Blaney has just been appointed sales manager of the Selden Motor Car Company, Rochester, N. Y., and has entered upon his duties of placing the Selden agencies. This duty previously devolved upon the designer of the car, E. T. Birdsall.

E. Le Roy Pelletier, the well-known publicity and advertising manager, is now doing Italy, but will sail from Naples the latter part of this week homeward bound. He returns to take charge of Maxwell publicity, with headquarters in New York City.

W. H. Cameron has been appointed manager of the repair department of the Gibson Automobile Company, Indianapolis, Ind., who handle the Ford, Premier and Reo lines, and will conduct that part of the business under the name of the Automobile and Tire Repair Company.

Owing to the resignation of Mr. vanderhoff, as manager of the Philadelphia branch of the Ford Motor Company, Louis Block, who has been in charge of the Buffalo branch, will transfer his headquarters to the Quaker City, while Roger Stearns, who has been acting as assistant to Gaston Plaintiff, of the New York branch, will take charge at Buffalo.

NEW TRADE PUBLICATIONS.

A house organ is now produced by the Autocar Company, Ardmore, Pa., under the title *Autocar Life*. Its object is to keep Autocar owners informed of doings in their own particular world, and, to judge by the style of the special show number just to hand, this is thoroughly attained.

Bridge whist and automobiling are combined in the publication by the Peerless Motor Car Company, Cleveland, O., of a bridge whist score book, on the heading of each page of which is a scene on the highway when touring in a Peerless. At the end individual scores are forwarded and rules for playing whist are given in full. The idea is an excellent one, and the publication should be a success. Automobilists can obtain copies on request at the headquarters of the company.

INFORMATION FOR AUTO USERS

New Tooth-Chamfering Attachment.—Chamfering of the spur gear teeth of the pinions of an automobile gear-set may appear to be a matter of minor importance, but it is one of those little things that have contributed to make the automobile a success. Automobile manufacture nowadays is made up almost entirely of details, and success in this field is coming to be more

LONG-ARM TOOTH-CHAMFERING ATTACHMENT.

and more a question of economy in carrying out these multitudinous details of construction in a first-class manner. This is where the value of special machine tools and attachments such as that shown here, which has just been perfected by the Long Arm System Company, Cleveland, O., contribute to successful automobile building. The Automatic Tooth-Chamfering attachment does the work more uniformly and in better shape than it is possible to do it by hand, or by any of the make-shift devices adopted in many shops. It also does the work more rapidly, and that means economy.

Wico Roller Timer.—One of the latest specialties added to its line of ignition apparatus by the Witherbee Igniter Company, 541 West Forty-third street, New York City, is known as the Wico Ring and Roller Timer, Wico being the trade

DETAILS OF WICO ROLLER TIMER.

name under which this concern puts out all its ignition specialties, with the exception of the well-known Witherbee Igniter, or storage battery. It is constructed on a novel principle, consisting of a loose ring, which is rolled upon the different contact

points as it revolves. The difference between the diameter of this loose ring and its containing case in which it rolls is such as to assure a constantly changing point of contact for the action of the current, the slight abrasion consequent upon this action and its impact being thus distributed over a comparatively large area. When rolled upon a contact point this ring acts as a direct conductor for the current into the case proper, bridging a gap of about 1-4 inch and reducing the resistance to practically nothing. It also distributes the effect of the resulting arc over its entire periphery. This loose ring consequently takes practically all the mechanical wear from the roller inside, and the action of the current outside, over an area much greater than the combined areas of similar surfaces on the usual type of timer. It may be replaced at nominal cost in a few minutes. The tool-steel contacts are hollow and contain a bronze spring, holding them uniformly in position. They are contained in a fiber tube extending nearly through the case, so that the ring cannot come in contact with the insulation.

McCanna Multiple Pump Oiler.—Lubricators of this type have many advantages, as the accidental derangement of any one of the pumps does not interfere with the working of others and conse-

M'CANNA MULTIPLE PUMP OILER, CASE REMOVED

quently the supply to the remaining bearings goes on unimpeded. Each pump may be adjusted to deliver a different quantity of oil according to the bearing it is feeding, and any one of the pumps may be operated by hand at any time without changing the adjustment. A single pipe leads from the reservoir to the pumps, with a direct pipe from each pump to the point to be lubricated, the pumps themselves being constructed on approved hydraulic principles, thus insuring long and reliable service. The oil tank may be placed at any easily accessible point under the hood, body or seats, thus removing this encumbrance from the dash and keeping the floor boards clean. Kerosene

M'CANNA PUMP.

may be fed to any point desired and in any quantity, merely by putting in the sight feed chamber of the respective pump, thus making it possible to flush out any of the leads without taking down anything. A small electric light is provided to show the oil feeds at night. These multiple pump oiling systems are made in any number of leads from one to twelve for automobile use by the McCanna Manufacturing Co., 56 N. Jefferson street, Chicago.

Breech-Block Clip Handle.—One of the new features of the Breech Block spark plug, manufactured by the Standard Company, Torrington, Conn., is the terminal clip handle shown by the accom-

BREECH-BLOCK CLIP HANDLE.

panying illustration. The handle is of enameled wood, and is inserted in the clip in place of a cable, the regular cable clip being attached to the Breech Block clip with a small brass screw and nut, which are furnished with each plug. The cable thus attached to the clip at right angles renders the clip easily removable from the plug, as the cable, instead of being pulled against itself, acts as a hinge. The handle is an insulator, and is very convenient for ignition testing purposes.

Raybestos Brake Lining.—To meet the demand for a brake lining combining great wearing qualities and high heat-resisting power to stand constant application on long hills, the Royal Equipment Company, Bridgeport, Conn., has recently placed on the market a new brand of brake lining known as the "Raybestos." It is composed of asbestos woven with wire, and subjected to a special treatment, from which it obtains its adhesive qualities. It is claimed by the makers to have an unlimited wearing life, while no amount of heat can affect it. This company was one of the first to place a brake lining on the market, their "Stability" brand being well-known for several years past. It consists of a closely woven duck given a special treatment, securing adhesive and wearing qualities. It has a life of more than 10,000 miles' running, and is suitable for both light and heavy cars when not used constantly on stiff and long grades.

Auto-Top Gloss.—This is an elastic preparation for preserving and restoring the natural luster and finish of automobile and carriage tops, seats, guards, straps and the like, whether made of leather, Pantasote, rubber or similar material. It is manufactured by the James W. Cummer Company, 2901 East Thirty-fourth street, Cleveland, O., and is easily and quickly applied. The makers guarantee it not to crack or peel off, and one gallon is sufficient to restore and keep in first-class condition for an entire season all the accessories of this nature to be found on a car. As the average autoist allows his car to stand for long periods with the top folded, this treatment is very necessary for the preservation of the leather.

THE AUTOMOBILE

The Boston Show

BOSTON, March 5.—Boston's annual automobile show, the event to which New England flocks to get its ideas as to the latest developments in motoring, will open Saturday night in Mechanics Building. It will be the sixth show of the Boston Automobile

Dealers' Association, and there is every reason to believe that it will maintain the high reputation that has been won among the trade by its predecessors. Always a large show, the exhibition of 1908 is to be on a grander scale than ever before, for it will include the whole of New England's greatest exhibition building. For some years past it has been the custom to set off the basement of the building for the motor boat manufacturers. This year, however, the motor boat men held a separate show, which makes available much additional space for the automobile exhibits. And all this extra space is needed, for the demand has been greater than in any previous year.

With more space at their disposal than formerly, Manager Chester I. Campbell and the directors of the Dealers' Association have been able to carry out several novel ideas. One of these is the establishment of a fully equipped repair shop in a section of the basement. In this department will be installed the latest machinery for automobile repairing, and it is intended to have the machinery in operation. This section, it is expected, will be of special interest to owners who

take care of their own machines, and to chauffeurs. Another feature of the basement will be the large amount of space allotted to commercial vehicles. A number of firms which build commercial vehicles have taken space, and it is anticipated that the display will be more comprehensive than at any previous show in Boston.

In the matter of decorations the Boston show, the pioneer in the uniform decorative idea, will keep up to past performances. Manager Campbell's New England apple orchard of a year ago was admittedly among the most novel show decorations ever presented, and he has put together for this year something equally attractive, though with less local significance. The central idea is Japanese in effect, and for days past a large corp of decorators has been at work transforming the huge, bare halls into the semblance of a tea garden of the far East.

In Grand Hall the back of the stage will be covered by a wide drop, upon which has been painted a typical Japanese scene, with snow-capped mountains in the background and with the Japanese flag, dragons and other symbolic figures for the top and sides. Great quantities of wistaria blooms will be used for the stage front. To cover the great beams of Grand hall a canopy of white bunting will be used, while in the very center will be suspended a chrysanthemum of

John H. MacAlman, President. George H. Lowe, Vice-Pres. Chester I. Campbell, Secretary. F. A. Hinchcliffe, Treasurer.
OFFICERS OF THE BOSTON AUTOMOBILE DEALERS' ASSOCIATION, CONDUCTING THE BOSTON SHOW.

gigantic size, from which will run streamers to the sides and corners. In the center of the hall, where last year the band stand rested in the branches of an apple tree, has been built a magnificent fountain and basin with water spouting from eight jets. In the basin are to be placed gold fishes, and several massive palm trees will add to the picturesque effect of this central feature.

Instead of railings and fences, privet hedges are to be used to mark the dividing lines between the exhibition spaces, and at the ends of the hedges, along the main aisles will be placed bay trees. The sacred gates of Japan, which herald to the visitor the approach to a temple, have been erected over the principal aisles, and from them will droop wistaria blooms in profusion. The sides of the balcony are to be treated harmoniously with privet, bay trees and wistaria. For illuminating purposes thousands of electric lamps and Japanese lanterns will be employed.

In Machinery hall a similar system of decoration will be followed, the aisles being bridged with the sacred gates and great quantities of wistaria blooms being interwoven through a latticework. In the balconies, where are to be located the accessories departments, the general decorative scheme will be continued, and in the basement, also, there will be appropriate decorations.

To carry out further the Japanese effect of the show, Manager Campbell has employed many Japanese men and boys to act as pages and attendants, and these will be dressed in their native costume. The outside of the building will be adorned to some extent so as to give the visitor an idea of what he may expect after passing the turnstiles at the doors.

No lines between "licensed" and "unlicensed" cars are drawn at the Boston show, and for that reason it has been in the past the most complete in the country. This year

practically every manufacturer of any consequence has taken space, and many of the New York importers, both those who have Boston agents or branches and those who have not, are to exhibit. That the attendance will be large goes without saying. The Boston automobile show is the one event of the year, and the only one that fills the whole of Mechanics building with humanity. In addition to the great display of cars and their accessories, Manager Campbell has planned to entertain the great host of people with orchestral music in all the larger halls, and he has likewise made arrangements for the conduct of an excellent restaurant.

The interest that is being demonstrated in the show, both by the public and by the manufacturers and dealers, is the best justification the directors of the Dealers' Association could have of their attitude taken a year ago in opposition to the early show fever that swept the country. When it was announced just after the 1907 show that the next Boston show would be in March of 1908, there was much adverse criticism. Some of the members of the association believed that with the New York shows in the fall of 1907 the Boston dealers would have little or nothing to sell by March and that the value of the show would be lost. They brought much influence to bear to have the show date advanced to January, but Manager Campbell and the directors resisted this influence. As matters have turned out, March is the best possible time for the great New England motor exhibition. The dealers have plenty of cars to sell and they are all looking forward to the coming week to bring about a great boom in the retail business. Where a year ago the officers of the association were being roundly condemned, for not keeping up with the procession, now there is nothing but praise for their farsightedness in not being carried away by the early show idea.

MASSACHUSETTS HOLDS AN AUTOMOBILE IS NOT A CARRIAGE

BOSTON, March 2.—An important decision, affecting broadly the rights of automobilists on the highways of Massachusetts has just been handed down by the full bench of the Supreme Court, the highest judicial tribunal in the State. It is in effect that an automobile is not a carriage within the meaning of the statute and that towns are not required to keep their highways in condition for automobile travel, providing they maintain them in a condition reasonably safe and convenient for travel generally. The court further holds that an automobilist who has not secured a State license to operate cannot recover from a town for an accident on a highway, even if defective for general travel.

The decision was made in the case of William C. Doherty against the town of Ayer. Mr. Doherty was driving his automobile on a town way known as Sandy Pond road on September 21, 1905. At that time the Lowell & Fitchburg Street Railway Company was preparing to lay tracks in the street and the automobile sank from eight to ten inches in the sand. In an effort to extricate it, the chain was broken and the machine sustained other damages. Mr. Doherty brought suit against the town, and in the Superior Court was awarded a verdict of \$100. The town took exception to the instructions of the judge presiding at the trial that an automobile was a carriage within the meaning of the revised laws, and that it was the duty of the defendant under the statute to keep its roads reasonably safe and convenient for automobiles, so that they might be protected.

The question raised was a novel one and the court in its decision holds that the town is not liable to one who is using an automobile and who is injured in a highway that would not be defective to travelers generally

and cause them injury. The town is not bound to keep its roads safe for automobiles. The court calls attention to the fact that in England even railway coaches are called carriages, but nevertheless such vehicles are not included in any statute which provides that a town shall keep its roads in a reasonably safe condition for carriages. An automobile, as is any vehicle propelled by a motor or engine, is more a machine than a carriage. In the present instance the court notes that the automobile referred to is frequently spoken of as a machine. In many places in this State, especially in unfrequented roads, a driver or an automobile owner would encounter difficulties as great or greater than those presented to Doherty.

A point in question as to whether Doherty was licensed and registered is taken up by the court, and although it is ruled, as far as the evidence goes, he was duly licensed and registered, the court holds that if he had not been he would not be a traveler on the highways in a legal sense. In such a case an automobile owner would have no remedy for damages sustained in a defective road.

The statute governing the liability of towns for accidents on their highways was passed by the Massachusetts Legislature in 1786. It provides that towns shall keep their ways safe for "travelers with their horses, teams and carriages."

Commenting upon the verdict, Francis Hurtubis, Jr., formerly counsel of the Massachusetts Auto Association, says:

"While I do not care to give the impression that I believe the Supreme Court has erred in handing down the decision, if it has held that an automobile is not a carriage in the meaning of the statute, I am greatly surprised, for it seems as if we had taken a step backward."

BOSTON TO PRESENT A REPRESENTATIVE SHOW

In early days, when the cities outside of those entitled to hold shows of national importance first acquired the automobile show habit, Boston was among the very first to get in line. The affair was then purely a dealers' gathering, as are still many of the shows held in cities that started at the same time as the Hub. In the meantime, Boston has far outstripped its competitors—so far, indeed, that in speaking of the shows of the season, one never omits mention of the downeasters whose successful efforts in this direction have given them a strong hold on the distinction of being one of the "Big Three" shows of the year. Hence the importance of the Bay State's capital city as a show center.

When the early show idea took the trade organizations of the industry by storm last Fall, and the two strongest factors of the manufacturing community "fell for it," to put things in the vernacular, it was expected that Boston would follow suit as a matter of course, and when it was announced that the usual March dates would be adhered to there was more or less surprise expressed, though "It's only a dealers' show"

served to explain away a large part of this. But Boston is vastly more than a dealers' show, and the wisdom of sticking to what experience had proved to be the best course, does not require much explanation at the present writing.

It took many of the western manufacturers some time to get up their courage sufficiently to bring their exhibits on to New York for the annual line-up, and not a few cars that were staged in the Coliseum year after year never saw Broadway until 1906. Now they have reached the Back Bay and they will be there in force at the opening next Saturday night, is evident upon reviewing the accompanying list of exhibitors of complete cars. Add to this the fact that Boston is the home of not a few of the accessories and specialties that are known the country over, while many others first see the light in neighboring cities and the generous showing of exhibitors in this field speaks for itself, though accessory exhibits are not confined to home products by any means, as will be noted from the presence of well-known western makers in the long list of exhibitors of small wares.

THE CAR EXHIBITS AND THE FIRMS WHO SHOW THEM

 West & Dodge, 384 Atlantic Ave., Boston, Mass.
 White & Bagley Company, Worcester, Mass.

Experiences of Boston's Pioneer Autoist

BOSTON, March 5.— In the local automobile clubs, when the old-timers get to talking the ancient history of automobiling, it is not uncommon to hear them refer to such and such an event as happening "in the year George Morrill got his first steamer," or "the year George Morrill drove the little De Dion," or "the year George Morrill brought over the big six-cylinder Napier." To the novice this is all Greek, for though he very likely knows George Morrill, Jr., of Norwood (not to know him is a confession of little acquaintance with automobiling in Boston), he very likely is not familiar with the fact that automobiling in Boston began with Mr. Morrill, and that for the past fifteen years he has been one of the most ardent owners and drivers of motor vehicles in this State and in the country at large.

Mr. Morrill is president of the George H. Morrill Company, manufacturers of printing inks, whose large factory is one of the leading industries of Norwood, Mass. He makes his home in the same town, where he has a beautiful estate, including a large mansion, fully stocked stable and a motor house of large proportions. His estate is one of the sights of the town, and his motor house is known far and wide among automobilists for its complete equipment and appointments. While he is an enthusiastic automobilist and has attended many of the motoring events of importance in America and abroad, he has never used his cars with a view of establishing touring or speed records, making use of them largely for the convenience of himself and his family.

At least three things stand out prominently in Mr. Morrill's career as an automobilist: he owned the first car that was seen on the streets of Boston; he drove the first six-cylinder car seen in this part of the country; and he has owned probably as many automobiles as any other man in

Massachusetts, having been a possessor of twenty-one, including the four which now occupy his garage. His present equipment consists of a Model K Winton limousine, a Model M Winton touring car, a 20-horsepower

Napier runabout, and a Maxwell runabout, the last largely used by his son. This is rather a small equipment for him, as he has customarily had at least a half dozen cars at a time.

Mr. Morrill began his motoring career in September, 1893, when he became possessor of a single-cylinder runabout made by Charles Duryea, of Springfield, Mass. The car was shipped from Springfield to Boston, and when it made its appearance on the streets the crowds that assembled were so large that it was only with great difficulty that the automobile was driven through the city and to the home of its new owner in Norwood. It was on this occasion that the term "Get a horse" is said to have originated, though other sections make claim to the distinction of having originated this opprobrious ejaculation, formerly the bane of the automobilist, but happily now rapidly falling into disuse. The little machine made its initial trip without serious trouble, and people followed it nearly to the outskirts of the city. Long after that whenever Mr. Morrill was expected along the road crowds gathered at the corners much as they do along the parade route of a circus.

Regrets that He Did Not Save His First Car.

This first machine in Boston was a crude affair, compared with the latest products of the factories. The engine was under the footboard and the transmission was through a countershaft to the rear wheels, the power being transmitted by means of a series of belts. Chains were not then in use. The motor was rated at 10 horsepower, and there were three speeds ahead and one reverse. Speaking of his first experiment in motoring, Mr. Morrill said to THE AUTOMOBILE representative: "I have often wished that I had saved that first car, just to show what a fool a man could be. If I made it go five miles without a stop I thought I was having lots of fun. A little later, when I proposed buying another car, Mrs. Morrill sized up the situation well when she said that with the first machine I was lucky if I got out of the yard, and with the new one I would be lucky if I got back."

The second car owned by Mr. Morrill, also a Duryea, was bought in 1894, and he went over to New York to see it per-

"The Pines," Norwood, Mass., Home of Geo. H. Morrill, Jr., Owner of the First Automobile Driven in Boston.

Mr. Morrill is seated in the touring car on the extreme right of the picture. Behind the touring car is Mr. Morrill's Maxwell, containing his son, and behind that is his Napier runabout, containing Mrs. Morrill. On the left in front of the house is Mr. Morrill's limousine. His motor house is in the rear of the mansion.

form in the John Brisben Walker race from the city hall up to Ardsley and return. The race started, and for ten miles or so Mr. Morrill followed the car with a pair of horses. The longest trip he made with this car was from Norwood to Providence and return, and the journey took two days. Mr. Morrill frequently makes the same trip with one of his present cars in a few hours. At that time he was able to buy gasoline at five cents a gallon, and when the price was raised to eight cents it seemed to him like extortion. There was no need of sirens and other forms of warning, for the machine made noise enough itself to warn everything else out of the way. People were known to have stood beside the road for three hours to watch the contrivance go by. In 1895 Mr. Morrill drove his automobile to the Brockton fair, and it was the first machine that had been seen there. The car was a greater attraction for the fair visitors than the Midway, the prize cattle, or the balloonist.

Mr. Morrill Also Owned a Number of Steam Cars.

After several years' experience with the Duryea gasoline cars, Mr. Morrill turned to steam, which seemed to be in the ascendancy, and his first steamer was a Locomobile of the small runabout type. Then he had in succession five Stanley steamers, and the Stanley brothers always took great pride in keeping Mr. Morrill's cars equipped with the very latest devices and improvements. Thus he had one of the first ball-bearing cross heads and one of the first superheaters. These early steam cars gave good satisfaction compared with the earlier gasoline vehicles, but Mr. Morrill eventually went back to gasoline explosion motors and has used them steadily ever since. At one time he owned two small De Dions, then much in vogue in Boston and vicinity, and at other periods he drove a Rambler, Pierce Arrow, a Stevens-Duryea, and other well-known makes of American gasoline cars.

He has owned five Wintons, and bought the first Winton car sold by Harry Fosdick when he became manager of the Boston branch of the Winton company. That was in 1902. The following year he purchased another Winton, and in 1904

bought a third. His other Wintons are the two which he is now using and which constitute the chief members of his "stud."

It was in 1904 that Mr. Morrill introduced the six-cylinder to Boston. He went abroad in the summer, and while in England with Charles J. Glidden, the world-girdling automobilist, bought of S. F. Edge & Co., Ltd., a six-cylinder Napier. With this car he toured in England, and also drove to the Gordon Bennett race in Germany. He brought the car home in June, 1904, and drove it for several years, using it on his trips to the Florida tournaments in 1905 and 1906. Said Mr. Morrill: "That car cost me in all \$12,000, and I sold it last year for \$1,900. I am through with foreign cars, and have no use for anything but those made in America. I also do not care for six-cylinders. I believe that if a properly made four-cylinder and a properly made six-cylinder were placed side by side, and a man were asked to tell which was which without seeing them, he would be unable to do so. They talk a great deal about better balance and all that sort of thing, but I don't see it, and I have had experience."

His Hospitality Is Noted and His Garage Is Ideal.

Recently Mr. Morrill had his garage, formerly 35 feet square, enlarged to 35 by 55 feet. It is equipped in the most up-to-date manner with granolithic flooring, turntable, pits, stands, washing space, and the like, and he is about installing electric lights. Everybody who travels the New York road through Norwood knows that in case of emergency he will find all sorts of supplies in the Morrill garage, and Mr. Morrill is the kind of automobilist that believes in helping his brother sportsmen when in distress. His automobiles are always at the disposal of his friends, of whom he has many, and it is not a strange sight in Norwood to see a cavalcade of three or four automobiles filled with people leaving the Morrill estate for a run to some point of interest. Mr. Morrill has kept no account of his mileage, and does not know how many thousand miles he has traveled, but each summer he does much touring, usually making a trip into the mountains, and he keeps his cars going all through the Winter.

S. A. E. TO MEET AT BOSTON, MARCH 10 AND 11

THE first quarterly meeting of the Society of Automobile Engineers for the present year will be held at Boston during the course of the show there. It will be opened on Tuesday evening by the reading of a paper on electrical ignition by J. O. Heinze, at the Massachusetts Institute of Technology. The following morning, at 9:30, the members will rendezvous at the headquarters of the Bay State Automobile Association where a number of cars will be waiting to convey them to Lowell, Mass. Lunch will be served at the Lowell country club, and immediately following this the members will pay a visit of inspection to the laboratory and factory of the Heinze Electrical Company, which is said to be one of the best equipped plants of its kind in the country. Two hours are to be allowed for the 30-mile drive back from Lowell. A dinner will be held at the Bay State Automobile Association, and this will be followed by the reading of papers.

Among the subjects on which papers have been prepared, are "Perfecting Automobile Ignition," by J. O. Heinze; "Design of Automobile Crankshafts," by P. M. Heldt; "A Multiple Unit System as a Solution of the Heavy Goods Transportation Problem," by Joseph A. Anglada; and "Automobile Forgings," by Richard W. Funk. The reading of the papers will be followed by a discussion of the points brought out by the different authors in the course of their papers, and in this, the members of the Bay State Automobile Association have been invited to join.

Mr. Heinze's paper deals with a phase of the subject of electrical ignition on the automobile that has received only

too little attention in the past, and his researches and experiments on the subject, which have probably been more extensive and thorough than have ever been undertaken in this country, show in a highly interesting manner just why automobile manufacturers found the maintenance on a car of what appeared to be an insignificant current, such a difficult and vexatious problem to solve. So little had been done in this field hitherto that Mr. Heinze had to devise his own instruments for testing and they are very ingenious.

In his paper, Mr. Heldt briefly sums up what has been learned regarding the design of that most important part of the motor—the crankshaft. He shows why there have been so many failures in the design of this essential, as well as the influence of the method of manufacture on the production of an enduring crankshaft, in addition to which he dwells at some length on the new two-bearing crankshafts for which the adoption of the block type of motor has been responsible. Mr. Anglada has made a close study of the problem of economical heavy goods transportation by means of the multiple unit system of haulage, using a gasoline-electric tractor and self-propelled units controlled from the latter, as well as of the tire problem in connection with this most important automobile development. "Automobile Forgings" is a title that is self-explanatory, but in his paper Mr. Funk confines himself to what he has learned in the actual production of many hundreds of motor crankshafts by different methods of forging and with different materials. It is probable that the summer meeting of the Society will be held in Detroit.

BOSTON as an Automobile Mart

BOSTON, March 5.—Being the mercantile heart of New England, as well as the "Hub of the Universe," it is natural that Boston should early assume an important position in the automobile trade, and to-day there are few cities, if any outside New York and Chicago, which have as large a number of dealers in motor vehicles. When the industry was in its infancy the concerns that first essayed to manufacture on a business basis looked to Boston for encouragement, and some of the first agencies and branches in the country were established here. Keeping pace with the wonderful growth of the industry, the trade in Boston has grown and broadened until from a couple of stores on Boylston street and one or two in the old bicycle section of Columbus avenue, the business has increased until it includes a half hundred well-established concerns, occupying most of the stores on large sections of Columbus avenue, Boylston street and Massachusetts avenue and representing nearly four score different makes of automobiles.

Though the development of the trade in Boston has been extremely rapid, it has been built up on the firm Boston basis of conservatism, and the wisdom of this sort of progress has been amply demonstrated during the past three months or more. While automobile dealers in some other cities have been worrying about the prospects for 1908, the Boston dealers as a rule have been doing a steady business and the number of new concerns that have entered the field indicates that, in the opinion of those closely connected with the trade, the New England field is susceptible of much future development. The number of foreign agencies that have been established is a feature of recent developments.

There is scarcely a car which has gained any recognition whatever that is not on sale in this city, and some of the dealers have built up most profitable businesses handling one line of cars year after year. Such an instance is Alvan T. Fuller, recognized as one of the leaders in the local trade. Years ago Mr. Fuller entered the automobile business. He was only a boy in years and only a few of his intimate friends know now how few years have passed over his head. After handling various cars, Mr. Fuller secured the agency for the Packard, and he has handled it ever since, making it easily one of the most popular automobiles in New England. Mr. Fuller also has handled the Cadillac with success for several years.

Another dealer who has made a success by sticking to one line is J. W. Maguire, the Pierce agent. Mr. Ma-

guire graduated into the automobile business from the bicycle trade, and he obtained the agency for the Pierce a number of years ago. By conscientious at-

tention to his work and through the medium of a first-class car he has built up a large trade in this vicinity. Another veteran of the trade is W. E. Eldridge, of the Stranahan-Eldridge Company, the Buick agents. Mr. Eldridge was once the manager of the Pope branch, and after leaving that employment he formed with Mr. Stranahan the present company. Another old-timer who has graduated from branch management into business for himself is A. E. Morrison, of the Morrison & Price Company, the Rainier and Wayne agents. Mr. Morrison was for many years with the Peerless company, but for the last few years he has been handling different lines of cars.

E. A. Gilmore, of the Whitten-Gilmore company, is one of the best-known automobile men in this section of the country. He was long with Thomas B. Jeffery & Co., as a manager of the Boston branch, and in this capacity he became acquainted with the trade throughout the New England territory. With Mr. Whitten, long in the automobile business in Lynn, Mr. Gilmore is now handling the Thomas line. Perhaps no man in Boston has been better known than J. M. Linscott, of the Linscott Motor Company. In the old bicycle days the Linscott road race was a famous event. Mr. Linscott early entered the automobile business and his firm is well known as the agency for the National and the Reo.

Among the branch managers are a number of men who have grown up with the trade in Boston. J. S. Hathaway, who presides over the destinies of the White company, operating two large garages besides a constantly growing sales department, has been connected with the company for many years. F. A. Hinchcliffe, the Winton manager, was in the automobile business in Boston way back when practically the whole product was steam cars. Then he went to New York and from there to Boston several years ago as Winton manager. John L. Snow, the Peerless manager, has worked his way up in the trade from demonstrator to salesman and two or three years ago was appointed branch manager. John H. MacAlman, manager of the Columbia branch, was for years with the Locomobile company in Boston and is one of the leaders in local trade circles. He is president of the Boston Automobile Dealers' Association, which holds the Boston show. F. J. Tyler, the manager of the Maxwell-Briscoe Boston company, entered the automobile trade only a few years ago,

The New White Garage in Boston.

This building, completed by the White Company last fall, is the largest garage building in New England. It is located on Newbury street, near Massachusetts avenue, and opposite the White Boston branch.

and the Kissel Kar, and the George H. Lowe Company has the agency for the American Mors.

One of the older branch houses is that of Thomas B. Jeffery & Co., which has been established on Columbus avenue almost from the beginning of the business. The manager is V. A. Charles, who was promoted a year or more ago after serving as salesman. The Ford company also has a prosperous branch alongside that of the Rambler, and the manager is Charles E. Fay, formerly with the Winton Company in Boston. The Dragon, Franklin and Studebaker companies also maintain branches in Boston.

Among the newer automobile concerns are the Algonquin Motor Car Company, of which A. E. Adams is manager, and which handles the Oldsmobile; W. M. Jenkins & Co., which handles the Mitchell; the Premier Boston depot, with Henry L. Johnson as manager; F. R. Parker, agent for the Elmore, and C. A. Eaton, agent for the Lambert. The Harry Fosdick Company, agent for the Springfield and the Atlas, is a concern of several years standing and has one of the finest show rooms in the city. Other leading dealers include the Custis-Hawkins Company, of the Motor Mart, agent for the Chadwick and the Grout; F. E. Wing Motor Car Company, agent for the Marmon; W. A. Frederick Company, agent for the American and Overland; Crown Motor Car Company., agent for the Glide; Boston Motor Car Company, agent for the Acme; Everett S. Litchfield, agent for the Austin; E. P. Blake Company, agent for the Jackson and the Logan; Fred

but he has succeeded in making the Maxwell known from one end to the other of his territory. K. M. Blake, the manager of the Locomobile branch, is comparatively a newcomer in Boston, but in the few years he has been here, though laboring under great difficulties, he has established an enviable clientele for the Locomobile.

The foreign cars are represented more strongly in Boston at the present time than ever before. One of the latest branches opened is that of the Fiat Automobile Company, with S. H. Baker, formerly connected with the J. W. Bowman Company, the Stevens-Duryea agents, as manager. Another new foreign car branch is that of the Panhard & Levasor company, with George T. Gould, formerly of New York, as manager. A. C. Morse has lately taken the agency for the Renault, and the Darracq company also has a local agency, while Morgan B. Kent handles the Hotchkiss as well as the Stearns. American-made models of foreign cars are also well represented here. The Park Square Auto station, of which C. F. Whitney is manager, has the agency for the Berliet as well as the Stoddard-Dayton; H. C. Stratton & Co. handle the American Mercedes along with the Car De Luxe

S. Smith, agent for the Apperson, Autocar and Walter; George J. Dunham, agent for the Royal Tourist and Corbin; Reed-Underhill Company, the Knox agent; F. E. Randall Company, agent for the Pennsylvania, Pullman and Stilson; Mills-Kennedy Company, agent for the Welch; Allen-Kingston Company, agent for the Allen-Kingston; H. C. & C. D. Castle, the Lozier agent; J. W. Bowman Company, the Stevens-Duryea representative; Roy E. Faye, the Matheson agent; the Dodge Motor Vehicle Company, representing the Pope line, and the Butler Motor Car Company, representing the Cleveland.

A list of the principal Boston dealers and the cars for which they are agents is as follows:

- Curtis-Hawkins Co., Motor Mart.....CHADWICK, GROUT, BABCOCK.
- Harry Fosdick Co., Motor Mart.....ATLAS, SPRINGFIELD, BAKER.
- A. T. Fuller, Motor Mart.....PACKARD, CADILLAC.
- F. E. Wing Motor Car Co., Motor Mart.....MARMON.
- W. A. Frederick Co., Motor Mart.....AMERICAN, OVERLAND.
- Crown Motor Car Co., Motor Mart.....GLIDE.
- Boston Motor Car Co., Motor Mart.....ACME.
- Park Square Auto Station, Motor Mart.....BERLIET, STODDARD-DAYTON
- Evrett S. Litchfield, Motor Mart.....AUSTIN.
- E. P. Blake Co., 21 Hawkins St.....JACKSON, LOGAN.
- Fred S. Smith, 36 Columbus Ave.....APPERSON, AUTOCAR, WALTER.
- T. B. Jeffery & Co., 145 Columbus Ave.....RAMBLER.
- Ford Motor Co., 147 Columbus Ave.....FORD.
- Linscott Motor Co., 163 Columbus Ave.....NATIONAL, REO.
- Peerless Motor Car Co., 178 Columbus Ave...PEERLESS.
- George J. Dunham, 189 Columbus Ave.....ROYAL TOURIST, CORBIN.

- Winton Motor Carriage Co., 1 Stanhope St... WINTON.
- Reed-Underhill Co., 222 Columbus Ave..... KNOX.
- F. E. Randall Co., 245 Columbus Ave..... PENNSYLVANIA, PULLMAN, STILSON.
- W. M. Jenkins Co., 286 Columbus Ave..... MITCHELL.
- Columbia Motor Vehicle Co., 74 Stanhope St... COLUMBIA.
- Franklin Automobile Co., 671 Boylston St.... FRANKLIN.
- Mills-Kennedy Co., 733 Boylston St..... WELCH.
- H. C. Stratton & Co., 741 Boylston St..... AM. MERCEDES, DE LUXE, KISSÉL KAR.
- J. W. Maguire Co., 745 Boylston St..... PIERCE.
- Allen-Kingston Motor Car Co., 887 Boylston St. ALLEN-KINGSTON.
- Flat Automobile Co., 885 Boylston St..... FIAT.
- Morgan B. Kent, 889 Boylston St..... STEARNS, HOTCHKISS.
- H. C. & C. D. Castle, 893 Boylston St..... LOZIER.
- Panhard & Levassor Co., 901 Boylston St.... PANHARD.
- Shawmut Motor Car Co., 901 Boylston St.... SHAWMUT.
- Stranahan-Eldridge Co., 823 Boylston St.... BUICK.
- Whittem-Gillmore Co., 907 Boylston St..... THOMAS.
- J. W. Bowman Co., 911 Boylston St..... STEVENS-DURYEA.
- The White Co., 320 Newbury St..... WHITE.
- Premier Boston Depot, 1008 Boylston St.... PREMIER.
- Studebaker Automobile Co., Boylston St.... STUDEBAKER.
- Maxwell-Briscoe Boston Co., 121 Mass. Ave.. MAXWELL.
- Dragon Motor Co., 119 Massachusetts Ave... DRAGON.
- Locomobile Co. of America, 400 Newbury St.. LOCOMOBILE.
- Algonquin Motor Car Co., 97 Mass. Ave..... OLDSMOBILE, COLUMBUS.
- Morrison & Price, 93 Massachusetts Ave.... RAINIER, WAYNE.
- George H. Lowe Co., 509 Tremont St..... AEROCAR.
- Roy E. Faye, Quincy Sq., Cambridge..... MATHESON.
- A. C. Morse, 222 Elliot St..... RENAULT.
- Coburn-Perclval Co., 179 Clarendon St.....
- Stanley Motor Carriage Co., Newton..... STANLEY.
- Dodge Motor Vehicle Co., Irvington St..... POPE.
- Butler Motor Car Co., 12 Harcourt St..... CLEVELAND.
- F. R. Parker, 288 Columbus Ave..... ELMORE.
- C. A. Eaton, 22 Concord St..... LAMBERT.

MAINE'S SHOW WAS A MOST SUCCESSFUL EXHIBITION

PORTLAND, ME., March 2.—Proving more successful than either of the two exhibitions held in the city before, the third Portland automobile and motor boat show has last week attracted hundreds of visitors to Portland. The big Auditorium was thronged daily, and the show has given an impetus to the automobile trade in Portland the like of which has not been experienced since the industry gained a foothold in the State. Frederick M. Prescott, of Malden, Mass., fresh from the successful Providence, R. I., show, had promised that the decorations for the Portland exhibition would be better than anything else ever shown in the city. He kept his word and many were the words of praise spoken for the artistic and sumptuous way in which the big auditorium was decorated.

In one thing Mr. Prescott was rather unfortunate, and that was in not being able to secure the entire Auditorium. The destruction of Portland's handsome City Building had caused a number of the city officers to take up their quarters in the Auditorium. They occupied the basement and exhibits were consequently excluded from this part of the building. But the main floor nearly made up for the deficiency. Every available inch of space was engaged. The following were the exhibitors and their exhibits:

Boothby Gas Engine Co., motors; F. A. Nickerson Co., Oldsmobile; Geo. D. Thorndike Machine Co., Mianus motors; W. L. Blake Co., marine motors, oils; The Stanley Co., Stanley marine motors; Vacuum mobilolls; Camden Anchor-Rockland Machine Co., Know motors; Palmer Bros., Palmer engines and boats; Smith & Langmaid, Casco engine; Chas. F. Guptill Co., marine hardware; Harmon Automobile Co., Franklin, White steamers; F. A. Wentworth, Overland, Marion; Gray & Prior Machine Co., marine engines; Thos. Laughlin Co., marine hardware; Alvan T. Fuller, Packard; The James Bailey Co., automobile accessories; Swan & Stuart, Cadillac; Portland Automobile school; Harris Auto Oil Co., oils; Frank M.

Low, automobile and motor boat clothing; The Darling Automobile Co.; The Underhay Oil Co.; The Automobile Journal; Evans Stamping & Plating Co.; The Angier Co.; The Randall-Falchney Co.; J. B. Draper Co., automobile robers; Stoughton-Folkins Co., Maxwell; F. A. Nickerson Co., Pierce Great Arrow; Spear Auto Co., For and Fairbanks marine motors; L. C. Gilson Co., Reo, Stanley, Premier; Maine Motor Carriage Co., Stevens-Duryea, Pope-Hartford, Peerless; The Portland Co., Know automobiles.

The general tendency of the Maine market is toward a smaller and cheaper car, and many orders for these types were taken at the show. The runabouts have found especial favor with the physicians and business men who have been searching for a small car in which they may go easily to and from their summer residences. In considering Maine as an automobile market, it must be borne in mind that while the State is as large as all the remainder of New England put together, much of it is still an almost virginal wildness, so far as travel through it is concerned. The lumberman with his chief adjuncts, the saw mill and paper factory, has laid waste hundreds of square miles, but there never were any roads through these immense tracts, and had it not been for the pressing demand for lumber, there would not now be the logging trails which are their sole means of communication. Automobiling is consequently confined, in very large measure, to the southeastern corner of the State and consists principally of traffic between the cities and the seashore resorts, although more and more tourists are now braving the logging trails of the inland country each summer, and it is expected that the coming season will see a marked increase in the number of these itinerant auto camps in the Maine woods.

Up to the present time, 2238 automobiles have been registered in Maine, and as a result of the show, this number will be greatly increased before the Summer is over.

Bay State Automobile Association Clubhouse, Dartmouth Street, Boston.

BOSTON, March 5.—In the opinion of those automobile men who are customarily well posted on the condition of the business, the outlook for 1908 in New England does not possess many of the gloomy characteristics it is supposed to have in other sections of the country. They cannot see how the sale of cars is to be materially diminished during the coming season, when the general business situation has already taken an optimistic trend. All through the period of depression in New York and the West not a single automobile concern in Boston suffered apparent financial distress, and many of them report that their business so far this winter has been better than during the corresponding period of any previous year. People of Boston and of other sections of the territory have bought cars, others have placed orders for spring delivery, and the number of "prospects" is reported larger than usual. All this before the Boston show, generally considered the real beginning of the selling season hereabouts.

Dealers attribute this most satisfactory condition of affairs primarily to the fact that the people of New England are conservative in their business methods and do not rush into things unless they are pretty certain of their value. And when the pinch comes they are less likely to be caught. Secondly, the glowing prospect for the coming season is attributable to the fact that a large section of this territory with great purchasing power is only beginning to be developed for the sale of automobiles. Competition has had the result recently of causing the dealers to reach out from the cities into the country for trade, and it is not at all uncommon for a Boston automobile salesman to make a trip to the up-State towns or up to Vermont, New Hampshire and Maine and bring back several orders. One well-known dealer makes a practice of sending a car on journeys to the smaller towns, thereby interesting their residents in the cars. In this way, by means of a few demonstrations to the leading men, he has caught a large number of customers and interested "prospects" which could not be reached in any other way.

Massachusetts is by all odds the best of the New England states for automobile business. It has more miles of good roads, the largest population, and the highest valuation. Boston, the largest city, has the largest number of automobiles and is the richest field, but such cities as Worcester, Springfield, Lynn, Salem, and the other cities of secondary size offer a rich field for the sale of automobiles. The State of Connecticut cannot be worked to advantage from Boston, and in distributing territory it is a rare case to assign Connecticut, except, perhaps, the eastern section, to a dealer in

Boston. It is much more common to assign Nutmeg State agencies from New York, and New Haven has grown to be an important distributing center.

Providence is one of the liveliest automobiling cities in New England. Providence has a flourishing club which holds each year a hill climb of more than local renown, and the city also has its own automobile show, the recent show held in the new armory having been one of the best small exhibitions given outside the larger cities. To some extent the Boston dealers sell cars in Providence, a few of them having that city in their territory. Providence, however, has many dealers who look out for the people of their state.

North of Boston, according to a Boston dealer who controls the whole of Northern New England,

Vermont is the best State for automobiles. This statement was made recently in the presence of a number of automobile men, and it created somewhat of a surprise, for few, who had not had experience, had much idea that there was a market in the Green Mountain State. There are many hilly roads and not as much has been done in the way of development of the highways as in some of the other New England States. Nevertheless, each year a good number of cars are shipped into Vermont, and it is estimated that several thousand vehicles are in constant use during the driving season.

New Hampshire is also assuming considerable importance as an automobiling State. Two or three of the larger cities have automobile clubs, and there are several thousand machines owned and bearing the number tag of the Granite State. The State government is doing a large amount of road work, especially in the way of developing through routes from the southerly to the northerly section of the State. There are three principal routes. One leads up the Connecticut valley partly in Vermont and partly in New Hampshire, and crosses over to the White mountains. The second is the Merrimac valley route through Nashua, Manchester and Concord, and the third is the western route, from Portsmouth through the Ossipee to the White mountains.

The hotel men of the White mountains have also done much to stimulate automobile touring, and Bretton Woods early became one of the best-known automobile rendezvous in the country. It has been the destination or the turning point of two Glidden tours, and the "Climb to the Clouds" up Mt. Washington is world-famous. At first automobiling in New Hampshire was chiefly by non-residents, but within the past few years many residents have joined the ranks.

Maine, though it has thousands of acres of territory with no better roads than a logging track, has taken a great liking to the automobile, and the red and white number tags of the Pine Tree State are very common all over New England. There are many strongly established agencies in Portland, and several Boston firms maintain branch agencies in the city. Portland has an automobile club which is alive to the possibilities of touring and which has done much work.

Just how many automobiles there are in New England is difficult to say. It is generally considered that there are from 12,000 to 14,000 machines owned in Massachusetts, and probably there are as many more in the other States. Doubtless 25,000 machines in actual operation is a conservative number, while in the summer the number probably is increased by fifty per cent. by visitors from other States who come to New England for a longer or shorter period.

From the Oranges to Cape Ann

By J. Grant Cramer

The Lighthouse at the Entrance of Gloucester Harbor, a Locality Famed in Song and Story.

BRIGHT and early on the first day of October, Miriam, "Olive," and I set out for Boston. Miriam, "Blue Book" in hand, filled the rôle not of prophetess, but of pilot; I was engineer, and "Olive," strong of engine but gentle of voice, carried us without trouble, as she had done for many thousand miles before. It was cold, and the wind blew from the north so that we were glad indeed that we had brought an abundance of heavy wraps with us. We passed through Hacksack, whose police are said to be unfriendly to autoists, but it was too chilly for their zeal to blossom out so early in the morning. At Fort Lee we crossed the ferry, and soon we were on the old Boston Post road driving through the "neutral ground" of the Revolutionary days, which extended from the American lines along the Byram River to the British lines near Kingsbridge. The unfortunate inhabitants of this territory "feared every body whom they saw and loved nobody," for they were harried and robbed by bands of ruffians who gave allegiance now to King, now to Congress, as happened to be most profitable to them. But quickly the sad, far-off past fades away and is forgotten in the beauties of the present scene, as the eye is continually delighted by the broad Sound, with its irregular coastline of lovely bays and inlets and countless islands—Nature's emeralds in their gleaming setting.

Going on we came to the pretty little city founded two and a quarter centuries ago by the Huguenots, who named the settlement after their old French home, La Rochelle. Later, in Revolutionary days, the Hessians landed there and camped near the site of Larchmont. Passing the yacht club, "Olive" soon purred through the fine streets of Mamaroneck, Harrison, and Rye. The latter was settled by sturdy English colonists, who were not at all disturbed by the fact that the Dutch West India Company had purchased that territory and that possibly some Dutchmen might think they had something to say about the land.

The Pilot did her duty well, and it saved us much time to have her give the directions for the numerous turns and forks in the roads and streets. Her task of "conning" us through Portchester was not an arduous one, and in a short time we had left the Empire State and were in New England, which we entered by a region of beautiful estates, of which Greenwich contained perhaps more than any other city along our journey. From the road we could

see that the coastline had become more rugged with promontories standing out into the Sound, sheltering beautiful harbors. Down from the smiling hill country of Connecticut, through dear little valleys, flowed small rivers, the Byram, the Mianus, and other streams. The early settlers of this district finally united with the Connecticut Colony. They were good fighters, as the Indians and afterwards the British found to their cost. Right here in Greenwich, after the defeat of his little band by a greatly superior force, General Putnam escaped from the English by riding down the stone steps which were originally cut for the use of the devout on their way to and from the little church that stood on the hill during those troublous times.

Our undulating road now led us a little more inland through Stamford and Darien, and at the top of one hill we had a superb view looking far out over the Norwalks and the Sound. Three years after the Declaration of Independence all but six of the houses of Norwalk were burned by Tryon's troops, who did not accomplish their purpose, however, until they had had severe losses inflicted upon them by fifty Continentals and a few militia men.

Leaving Norwalk, the Boston post road led us through the charming rural Green's Farms and through Southport, where the Pequot Indians were finally nearly wiped out by Massachusetts and Connecticut troops. Southport has a large public library, the "Pequot Library," the gift of a wealthy citizen, which presents a fine appearance from the charming village street. In Fairfield, with its beautiful green and main street shaded by its grand old trees, we seemed to come upon the first of many lovely villages that we were to see, of each one of which one could say that it was a "typical New England village. Busy, manufacturing Bridgeport, the home of the late P. T. Barnum, was quickly left behind, and soon we drove through the quaint streets of Stratford. It did not take us long to cover the four miles between Stratford and Milford, whose early church members must have had an uncommonly good opinion of themselves if we may judge them from some of their resolutions, of which the following are specimens:

"Voted: That the earth is the Lord's and the fulness thereof."

"Voted: That the earth is given to the Saints."

"Voted: That we are the Saints."

Scenes Near Picturesque Cape Ann.

At Stratford one should turn off to the left to go to the Berkshires by way of the Naugatuck and Housatonic valleys, but as we were going to Boston we headed toward New Haven, which we reached after a delightful drive along the shore road and past Savin Rock. At New Haven we took on gasoline because we had planned to spend our first night in Wallingford, where we wanted to call on friends, about twelve miles north of the "Elm City." As we drove up to the boarding school where two small cousins were staying, the children, who were up in an apple tree, clambered down and ran out, exclaiming: "Oh, Cousin Grant, we recognized 'Olive's' voice and knew you had come." For be it known, "she" was an old friend of theirs and had taken them for many a delightful all-day trip last Summer. As there was no garage in the village, "Olive" had to rest among carriages in a livery stable, where her lodging cost as much as at one

the branches of its great elms meeting above us. Continuing along the "Old Boston Street"—the Boston Post Road under another name—we were soon in Clinton, where in 1701 Yale College was founded; after six years the college was transferred to Saybrook, and in 1717 was finally established in New Haven. Another joy awaited us in the beautiful broad street of Saybrook Center, whose macadam is a continuation of the State road, which is better than the rather worn highway between New York and New Haven.

A little further on we came to the Connecticut river, fortunately just in time to catch the small ferryboat, to board which we drove down a steep gangway, where the grade must have been between 30 and 40 per cent. We asked why a bridge had never been built across the river at this place, and were told that the cost would be too great, as the traffic did not warrant its construction. Four thousand cars

Map of Lower New England, Showing the Popular Course for Tourists to Cape Ann.

of the best garages in Boston. We, however, were well taken care of. Our hotel was built by one of the early editors of the *New York Sun* as his residence, and was a fine example of a stately old country home. We thought the three richly carved mantel-pieces alone worth the trip from New York.

In the morning we drove down to New Haven, and to Branford and Guilford, which have two of the most beautiful greens that we passed through on our trip. The Branford green is very large and around it are the principal buildings—the churches, the town hall, the public library. The trees on the Guilford green are so close together as to give it the appearance of a large grove of fine elms as one approaches. An interesting building is the "Old Stone House," built by the early settlers in 1640 for their minister, Mr. Whitfield. The walls are of stone, three feet in thickness, well able to resist the attacks of murderous Indians of those days.

To such lovers of trees as the Pilot and myself the main street of the little village of Madison was a joy, with

had passed during the summer, but at less than a dollar per car with its passengers the revenue would not be very large. The two towns that maintain the ferry devote a part of the profits to improving the roads in their immediate vicinity and spend the rest on schools, etc.

On the other side, a steep sandy hill necessitated low gear work, but at the top the road became good and brought us into Lyme, beloved of artists, from which it was not a long run to New London. A short distance beyond we came to a glorious view over the Sound, with its many inlets, a foretaste of what we were to have on the morrow; but not for long, for soon after leaving Stonington darkness began to fall, and we found the macadam road to Westerly closed for repairs. This necessitated a long detour over an unknown country road, which was very narrow and at times led through woods and thick underbrush. In some places it would have been impossible for two vehicles to pass each other. This delay, however, did not prevent us from reaching the little Rhode Island town without difficulty in time for a

late dinner. Our hotel was a barn of a place; the rooms were very large with immensely high ceilings, so that one wondered how they could ever be heated. When we rose next morning we thought that Winter had surprised us, but found that it was warmer out of doors than in the house.

Beyond Westerly we came into a stony country with a charm peculiar to itself; gray boulders peeped up from the fields; stone fences and low shrubbery lined the roads, all their tones soft and lovely, blending harmoniously into each other. Here and there were dashes of color, where the sumach and the maple had thrown out flame signals, the exceeding glory of their foliage telling of its approaching death. To the right were magnificent views of the Sound with its countless bays, inlets, estuaries and lovely islands, on which we feasted our eyes as we bowled over the smooth undulating roads. But a few miles before reaching Charlestown we had to come back to earth, for a narrow road with deep sand required some attention. At one place a gang of men were doing something to the road; by no stretch of the imagination could they be said to be repairing it. They were simply throwing loose earth in the shape of huge clods on top of the deep sand, so that "Olive" had first to climb up and over some hillocks of clods and then drop off into the sand on the other side. If it had not been for her double three point suspension and full elliptic springs we should have been well shaken; as it was, we only rocked as if in a boat or a cradle. A little beyond Charlestown the State road gladdened our eyes, but we had to leave it promptly, as it was being repaired, and go around by way of Green Hills. This we were not sorry to do, for the country road was good and we passed through some lovely woodland scenery before rejoining the macadam that carried us toward Narragansett bay.

Striking Back Inland from the Sea.

We were almost sorry when we reached Narragansett, for we knew that we should soon lose sight of the sea. The Pier was utterly deserted and produced a rather depressing effect on one who had seen it during the height of the season. Here a garage keeper told us that a little further on we should come to a fork in the roads; in all probability a boy would be there who would tell us to leave the State road because of repairs and take the left fork, which would ultimately bring us back to the main highway. The garage keeper told us that a few evenings before, finding the road barred, he alighted, threw the bars into the underbrush in a field and went on. Sure enough, going on we met the boy, but heeded his admonition to turn to the left, and it was well that we did, for when a few miles further on we swung back into the main road a few rods from the bars, we saw a man crouching in the bushes, evidently ready to jump out to arrest disobedient motorists who had run past the boy. Such actions as those of our counsellor are what tend to bring automobilists into disrepute and to make them disliked.

A little way out of Narragansett Pier we crossed a curious, old covered bridge which reminded us of similar bridges in Switzerland. Soon after leaving Apponaug we turned into the avenue bearing the same name. This street and its neighbor, Elmwood avenue, are as fine roads as I have ever traveled over, either on this side of the Atlantic or on the other. It certainly required strength of character not to exceed the speed limit. With the throttle lever opened but a trifle more than half an inch from the fully closed position, the speedometer indicated twenty miles an hour. But if the approach to Providence was swift and delightful, the passage through it was slow and tedious. We had to crawl owing to the congestion of traffic in the business portion of the city and to the bad pavements, and as for the drive to Pawtucket, I cannot do better than to quote the words of our guide book: "If there is anywhere a four-mile stretch with more turns in it than the run from Providence to Pawtucket, the 'Blue Book' has yet to hear of it."

We did a very simple thing, however; we tacked on behind a trolley car marked "Pawtucket," and, following that, we had no difficulty in finding our way. Shortly after leaving the town we came on to the State road which extends to Boston, and had a grand road all the way to North Attleboro, where we spent two days with friends. A delightful drive of thirty-three-miles through lovely little towns and villages brought us into Boston through the Fenways, and the afternoon of that day was spent in driving through the Newtons and visiting Auburndale, where I spent a year as a youth.

On the following day we started for a run to Cape Ann and back—a round trip of about 84 miles. We bumped over the Belgian blocks of Washington street, crossing Washington bridge, and went through Charlestown and Chelsea, which certainly seemed to justify what the Bostonians say about it, "as dead as Chelsea." Several miles of blocks had to be covered before we reached macadam, and then came a long stretch of good road across the salt meadows near Revere. To some they might have a bleak, almost desolate look, yet the cocks of salt hay and the wide expanse of meadow, with here and there patches of red, had a charm of their own. Then through Lynn, with its pretty suburb of Swampscott, on streets shaded by fine trees, through which we caught glimpses of the sea, we went on.

Soon we came to historic Salem and crossed a long bridge over Beverly Harbor into Beverly. From Beverly through Magnolia and Manchester up to Gloucester the fine road winding, now near the shore, now a little distance from it, is lined much of the way with fine shade trees and beautiful summer residences. At times one has the impression of driving through a beautiful park.

Gloucester is a picturesquely situated little town, famous for its men who can sail any craft that carries canvas. For about two or three miles beyond Gloucester the road was bad, very rough, muddy and rutty; after that it was good nearly all the way around Cape Ann. The views along the rugged western shore were beautiful, and the little village of Rockport was quaint and curious. It was interesting to see the men dressed in their Sunday best gathered in groups, lounging about the streets of these little towns, and when some of the younger natives shouted, "He's 'way from New Jersey," we realized that to them New Jersey seemed a distant land, and to us as well, for our departure from East Orange seemed more than a few days before—as we looked back over the successive pageants of fields, woods and sea and realized the store of beautiful memories that we had accumulated. The country in its October brilliance—with its foliage gorgeous beyond what we had ever seen—the uniformly clear, fine weather, the absolute reliability and freedom from trouble of our good car, all contributed to make this a delightful and never-to-be-forgotten trip that it would be difficult to duplicate on this side of the Atlantic.

Where "Mother Ann's" Jutting Rocks Meet the Sea.

SEVEN HUNDRED MILES IN NEW ENGLAND

By STANLEY W. COOK.

STARTING from Springfield one summer morning, we headed the machine over the well-trodden path towards Boston. This road, which on the whole is in the very best of condition, is marred by one stretch of very poor road about seven or eight miles long. The run to Boston was a most glorious one. Each of the six cylinders kept perfect time with its mate and nary a skip. What more could one wish for?

Leaving Springfield, we passed the large grounds of the Springfield Armory on the left, and going up a gradual incline came to the level, smooth road that took us out of the city on the way to North Wilbraham. Here there is a bad undergrade crossing that makes a short turn, cutting off the view of the road ahead. Passing through here the next town we came to was Palmer, a very peculiar place to get through if one is not acquainted with the numerous turns. Between Palmer and West Warren came the bad stretch of road which is actually a disgrace, when one considers that this is the main through route leading across the State.

The road then passed through a series of New England towns, among which is the town of Leicester, well known to most motorists. Here two years ago I had the pleasure of making the personal acquaintance of Constable Quinn, who was kind enough to show me the way to the Worcester Court House.

From Worcester there was a choice of several different routes to Boston. We decided on the well-marked and most frequented one by way of Shrewsbury, Marlboro, Sudbury, and Weston, all the way on fine macadam. We arrived at our hotel in Boston just 4 hours 10 minutes after starting. The entire run was made on the high gear without a stop.

Taking in the Sights of Boston and Vicinity.

The afternoon was spent around town on various errands, and in the evening we took a short ride through the Fenway, one of the noted park systems of Boston. One could spend a most profitable week making short runs around the Bay State Capital over some of the most beautiful and historical drives imaginable. The next afternoon we ran up the North shore as far as Swampscott and back, a run of 52 miles, including a detour through Charlestown. The roads were perfect and the boulevard follows the shore most of the way, passing through Lynn and Revere Beach.

The third afternoon was spent meandering slowly along the South shore as far as Nantasket Beach, passing through many interesting and historical places. This day only 42 miles were made. It was economy, however, to run through this part of the country at a very careful pace, as the officers of the law believe in making motorists run slow enough to fully appreciate the beauties of their towns.

The fourth day we started off bright and early for a run down to the end of Cape Cod. We followed the South shore as close as possible, and then continued on the inside part of the cape down to the little old historical town of Provincetown. A stop for lunch was made at Plymouth, where the Plymouth Rock is held up as the center of attraction. The roads on the whole were in very excellent shape, with the exception of a few stretches of sand down near the end, which, however, did not cause any trouble. The hotel was little more than could be expected in such an out-of-the-way place. As for the mosquitoes, if there could be a competition arranged between the Provincetown and the New Jersey lances I'd put all my money on the Provincetown variety. The distance for the day was 141 miles, which we did in 6 hours 30 minutes, sufficient proof of the quality of the roads that abound in this vicinity.

The next day the start was made at 9:30 A.M., and after retracing quite a bit of the previous day's run we cut across the cape to the outside edge. Considerable sand was met, but nowhere sufficient to use the low gear, most of it being covered without even using the second. We stopped for lunch at Wiano, a small summer place pleasantly located on the shore. The hotel here went by the demure name of Cotochesett. After lunch the run was continued on through New Bedford and Fall River to Providence, covering in all 160 miles. The road between New Bedford and Fall River is a most tempting one for friendly brushes with other cars. It is quite wide and runs through open country most all the way, with practically no hills and nearly straight.

On the Way Home from Roger Williams' City.

The sixth and last day of the trip was from Providence to Springfield, the starting point. This part of the road was familiar to me, as I had been over it several times before, so no time was lost asking the usual questions and consulting guide books. We left Providence at just 9 o'clock and from there went first down to Narragansett Pier. From Providence to the Pier was very evident the way in which fast driving will tear up the roads if they are not kept in constant repair. Two years ago when I went over this same stretch it was in excellent shape. Now at the turns the inside is all worn off to the lower foundation of coarse rock, while on the outside the loose stones have been piled up in regular ridges where they have been thrown by cars skidding around the turn. On some straight stretches two regular grooves have been cut through the top dressing such as no slow-moving teams could do.

Near New London came our first tire trouble, a puncture that required quite a bit of work to fix up, though not much time was lost. After passing through a series of toll gates and ferries, we at last came to the mouth of the Connecticut river where it empties into Long Island Sound. After crossing to the other side on a little ferryboat that looked ready to fall to pieces most any moment, we started up the river, following it closely the rest of the journey, passing through Hartford and Windsor Locks, where the river was recrossed, entering Springfield by the way of Long Meadow. This last day's run was 175 miles, making a total of 675 miles as the distance between towns; this added to what running we did around Boston in the mornings we were there made a little over seven hundred miles as a total.

The Car and the Weather Agreeable.

With the exception of the one puncture and the changing of one spark plug, the run was made without any trouble at all. As we sat at dinner that night everyone came to the conclusion that for real true enjoyment nothing can go ahead of the combination of a willing car, good roads, and fair weather, and nowhere else in the country are the last two essentials of the combination to be found to such an extent as in New England. The downeast brand of weather is almost as good as the majority of its main roads. There are stormy days to be sure, but they are not frequent and seldom come together in one of those continued stretches that make touring unpleasant. In anything but downright bad weather, it is possible to get along without any great difficulty if covering the ground be the tourist's chief desire, as the macadam roads are generally in such shape that it takes far more than an ordinary storm to make them at all difficult for automobiling. But one is scarcely in a mood to enjoy scenery under such conditions, and the New England variety is worth seeing.

QUAINTEST CAPE COD WHICH RESISTS MARCH OF PROGRESS

By ARTHUR R. WILLCOX.

A GREAT sandbar venturesomely stretching out seventy miles into the ocean; its jagged edges forming scores of pretty harbors; its wild dunes capped here and there with a lonely lighthouse or a "wireless station," and its beaches dotted with quaint hamlets, fishermen's shacks, and life-saving stations; with its ever-present suggestion of the sea, and the quaint characters who make this neck of land a separate country, isolated from the mainland and apart from the times: that is Cape Cod.

Barnstable, Buzzards Bay, Yarmouth, Provincetown—these are names that instantly suggest the one heritage of the old days that has been preserved inviolate against the assaults of time. And yet, isolated and antique though it be, the Cape Cod country is fast becoming a paradise of motorists; the "devil wagon," as well as the locomotive, pushing its way to the farthest point.

The western portion of the cape, as far east as Chatham, is covered with a network of excellent roads, which furnish a veritable scenic railway ride to the many automobilists who are touring the cape in ever-increasing numbers. The lower part of the cape is already a popular summer resort; but those who, in these latter days of rush and strenuousness, love to linger amid the scenes of former days and study the quaint characters that inhabit this picturesque locality, find the seaward end rich in the treasures they seek.

Those who select the automobile as the key to the real "Quaintest Cape Cod" of the eastern end, had best provide themselves generously with horsepower, for the "network of fine roads" finally simmers down to one turnpike, with miles of hub-deep sand that only the hardy survive; and the arrival of an automobile at Cape Cod excites as much interest as the arrival of the trains—which reach the end of the cape in apparent comfort despite the roller-coaster aspect of the railroad.

Between Chatham and Orleans there are eight miles of sand almost impassable for the automobile, but as this stretch may be avoided by keeping on the northern route, there remain only two bad stretches of a few miles each, which are a good test for the machines and supply their own

reward to those who succeed in conquering them. In going through the first of these two stretches the autoist must follow the telegraph poles in a general way, mapping out his own route, and exercising extreme care to avoid traveling in the road. But there are rich rewards in store for those who survive these sandy stretches, and the rolling, winding road, paralleling the little single-track railway, skirting the water's edge, hemmed in by the vast stretches of bay and ocean, and cooled by delightful breezes, is a shore drive that cannot be duplicated anywhere.

From South Wellfleet, where the steel towers of the Marconi wireless station are picking up messages from over the sea, through miles of wildest sand dunes, with an occasional village or lighthouse, to fishy Provincetown, where the Pilgrims first set foot on American soil, the ride is one never to be forgotten.

Provincetown, the quaintest of relics of the old days, though it contains comfortable hotels, lays no claim to fame as a resort, its chief attraction to the tourist being the quaint atmosphere that has been preserved against the romance-blighting march of progress. Here one may see the old "town crier" treading his way slowly through the little street, ringing his bell and shouting in a weather-beaten voice the announcements on his day's list. The air at times is freighted with the pungent odor of codfish, drying by the thousands on racks at the water's edge.

The big blue sweep of Cape Cod Bay is dotted with ships; the land stretches back southward in one long narrow curve to the misty mainland—and everywhere else is the sea. Up at "the lookout" bronzed old salts study the movements of ships in the offing and speculate on the weather possibilities, or discuss the beautiful Pilgrim's monument which is now being erected in commemoration of the landing of the forefathers at this spot, while down at the wharf are landing pilgrims to the shrine of Antiquity, reverently treading the hallowed ground, eagerly imbibing the sounds and sights and smells of Provincetown, and, far from the prosaic atmosphere of the cities, are living for a few golden hours another existence, among the picturesque Cape Cod folks.

FOR THOSE FINED NEAR ALBANY, N. Y.

ALBANY, N. Y., March 2.—About the first of October, 1906, the authorities in the town of East Greenbush, Rensselaer County, conceived the idea of raising enough funds to build new bridges and take care of the poor of the town at the expense of automobile tourists who passed through there.

Nearly every one approaching Albany from the East or South has to travel over a stretch of macadam road, beginning at the town of Schodack and passing through the town of East Greenbush. This new State road is contiguous with a number of miles of very poor clay road. Consequently nearly every autoist who travels over this road is very apt to run his car to the limit of twenty miles an hour.

Jesse P. Van Ness, the justice of peace, secured the services of a number of deputy sheriffs and started his trap, and thereby collected from automobilists \$800. During the fall of 1906 and the summer of 1907 there was practically \$800 spent and retained by this justice of peace. A taxpayers' action has been brought by residents for an accounting.

As many automobilists have contributed to this fund, it is requested that any person reading this notice, who has paid a fine in this town, send his name with date of arrest and amount of fine levied to Bender & Hinman, attorneys, 81 Chapel street, Albany, N. Y.

WOMEN'S CLUB RUNNING CALIFORNIA SHOW.

SAN FRANCISCO, Feb. 26.—After the Dealers' Association of San Francisco had discussed an automobile show and abandoned it, and the Automobile Club of California had considered it and decided to leave it alone, the California Women's Automobile Club resolved to accept the responsibility of a public exhibition the first week in March. As last year, the Coliseum will be the scene of the automobile display.

In connection with the show there will be two automobile parades under the guidance of the Automobile Club of California. Among other outdoor events are a hill climbing contest for runabouts to the summit of Buena Vista Heights, the entire course being visible from the Coliseum; on Wednesday, March 4, there will be a touring car competition over the same course, and on the following day a free-for-all motorcycle race on the hill.

Although dealers have been divided on the advisability of holding a show, the following makes of cars will be represented: Acme, Aerocar, Auburn, Chadwick, Dragon, Elmore, Frayer-Miller, Gale, Glide, Jackson, Locomobile, Marmon, Matheson, Maxwell, National, Overland, Pennsylvania, Renault, Stearns, Stevens-Duryea, Tourist and Winton. Motor boats, airships and a full line of accessories will also be exhibited at the women's first San Francisco auto show.

AUTOMOBILE HUB BALL BEARINGS*

BY HENRY HESS, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

THIS is an account of certain experiments undertaken to determine the behavior of ball bearings as used in an automobile hub under proper and improper conditions.

The Bearing.—The bearing selected for test is of the well-known Hess-Bright type, having two-point contact, races of uniform cross-section, i. e., uninterrupted by any filling opening, and with elastic, individual separators interposed between

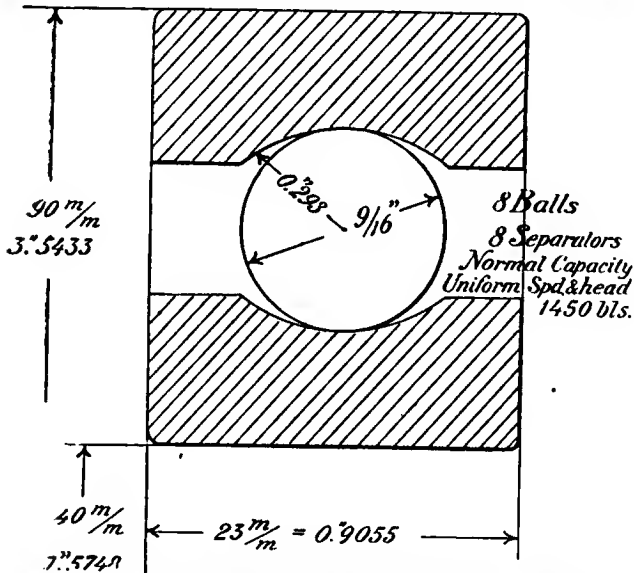

Fig. 1.—Dimensions of ball bearing employed for test.

Editor's Note.—Through a draughtsman's error the explanation reads "spd and head" instead of "speed and load."

the balls. The size is that known as No. 308; its dimensions are given in Fig. 1. This is a size very widely used in the hubs of automobile touring cars.

Use Conditions.—In a hub the load will be purely radial, i. e., at right angles to the axis when the car is going straight ahead. When rounding curves or weaving from side to side an end thrust, parallel to the axis, will be imposed in addition. Properly mounted and taken care of, the bearing will be amply lubricated and kept free of rust and grit.

Test Conditions.—Test conditions were arranged to conform, as nearly as might be, to the proper and improper conditions that would be found in actual use. They, therefore, embraced:

- (I) Radial loads only.
- (II and III) Combined radial and thrust loads; and
- (IV) Thrust loads only.

The latter condition is not likely to obtain in a hub or axle, but is of interest, as the question of behavior under that condition is often raised.

Test runs with (A) copious lubrication, (B) practically no lubrication, (C) with rust, and (D) with grit, were repeated under each load condition. The loads ranged from a low load as compared with the capacity of the bearing to a very decided overload. The radial load started at 600 pounds and was raised by 200-pound increments to 2,000 pounds. The thrust loads ranged from 50 pounds to 400 pounds by 50-pound increments. The speed was taken at 300 r. p. m., this corresponding approximately to thirty miles per hour of a car. Copious lubrication was provided by allowing the bearing to dip into a relatively large reservoir of oil, so that the bottom balls were carried through that. For dry run-

ning the bearing was rinsed out in gasoline and then dried out in an air blast; this left a very slight oil film, not perceptible to the touch, but nevertheless present. After this test the bearing was rusted in water until a light coat was deposited on all surfaces. Owing to the high finish of the balls and races the rust film on these was not thick; on the separators, which are not polished, the rust was much heavier and interfered decidedly with their elastic action. Grit was provided by throwing sharp building sand between the races.

Comparative Results.—The measured friction coefficient may safely be taken as an index of the running under each condition. It is certain that a low coefficient means favorable running and long life, while an increase in the friction indicates an adverse development.

The Apparatus.—The machine employed is a special friction measuring machine, capable of definitely measuring the force of the frictional resistance due to radial loads up to 15,000 pounds, of thrust loads up to 10,500 pounds, and of combined radial and thrust loads in any ratio within these limits, and at speeds ranging from 200 to 2,000 r. p. m. The radial load is applied to the bearing under test by a system of weighing beams through a tension rod that is jointed near the test bearing. The friction of the bearing swings the joint to one side by an amount depending upon the frictional force. This movement is small, but measurable by a microscope and within a negligible error. The thrust load is applied by a second system of weighing levers through a small wire of high elastic limit attached to a yoke resting against the outer race of the bearing. The friction tends to rotate this yoke. This tendency is resisted by a delicate set of scales, an error of observation of not over half of 1 per cent. is had without involving particular nicety of manipulation. The principle of the machine as to the radial friction

Fig. 2.—Test of bearings under radial loads only.

and measuring features is due to Professor Stribeck, of the Technical Laboratories, near Berlin, extended, however, to give the ability of applying loads about ten times as great while realizing greater accuracy of measurement and convenience of handling. The arrangement for thrust loading and thrust friction measurement is original.

Plotted Results.—A diagram of the observed friction coefficients is devoted to each series, I to IV, and each is given a curve, laid through the observed points of the runs made with the bearing lubricated (A), dry (B), rusted (C), and grit (D).

In Fig. 2, the bearing was run under Radial Loads Only. The friction (always referred to the bore of the bearing in

*Paper read before the Society of Automobile Engineers.

order to permit of ready comparison with the friction that occurs in plain journals at the bore or shaft surfaces) ranges from 0.21 to 0.25 under copious lubrication (A). The Dry Running curve (B) is parallel, and, curiously, lies about 10 per cent. lower. The difference represents not the difference in bearing friction, but that of the relative resistance of the copious oil supply and the slight film left after the oil was washed out in gasoline. It would not do to conclude that this justifies the cutting out of oil, as is not infrequently advised; aside from other considerations, oil, and plenty of it, is necessary as a rust preventive.

Curve C, with the Bearing Rusted, shows at first about 50 per cent. increase in friction, and then, very surprisingly, a gradual drop, curving down to the best values of A and B; but toward the close rising again sharply. An examination of the races involved shows that the initial higher friction was due to the rust, that, as this was worn off, the friction dropped and that the roughing due to the rust having destroyed the high polish and the truth of the ball and race surfaces was attended by an increasing breakdown of these surfaces, as indicated by the final fast rise of the friction. Prolonged running would undoubtedly have confirmed the road experience of the very serious influence of rust on bearing life and endurance.

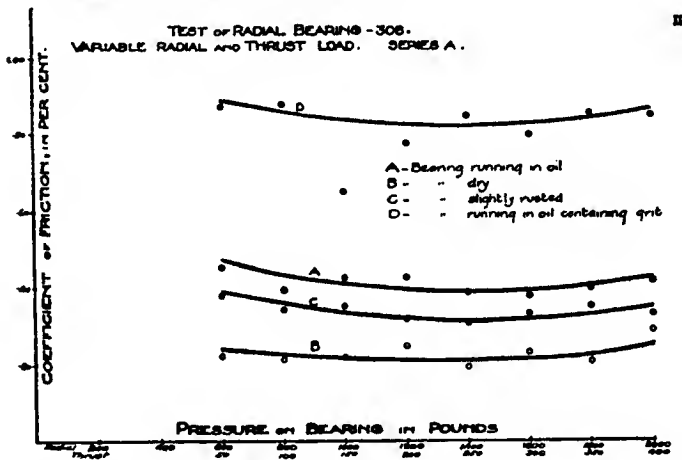

Fig. 3.—Friction under combined radial and thrust loads, increasing simultaneously.

As was to be expected, the insertion of grit raised the friction very decidedly. The readings varied widely, so that the average curve D will be seen to lie quite far from some of the points. As the run was started with the lower loads, and as it took some time to bring about an even distribution of the crudely inserted grit, the friction rose as the grit involved more of the surfaces; the drop after that is accounted for by the gradual working out of the grit and to the grits being worked down and partially destroyed by the wearing action of the balls. In an automobile hub the grit would be more serious since it could not readily escape. The friction due to grit and rust tends to draw the end plates and separators under the balls, and as these two destructive agents wear down the parts the separators may be, and occasionally are, drawn under the balls. That means a destruction of the separators, while the violent wedging also occasionally causes the outer race to be split.

Fig. 3 gives the friction of the bearing carrying simultaneous radial and thrust loads, increasing simultaneously. A comparison of values under the condition of good lubrication, A, between Figs. 2 and 3, shows that a thrust load of one-quarter of the simultaneous radial load about doubles the total frictional resistance, and that, as there is no pronounced upward trend within the load limits advocated, such combined loading is good practice. The curves of Fig. 4 for a constant radial load of 800 pounds, and a variable thrust

Fig. 4.—Constant radial load of 800 pounds and variable thrust load of 50 to 400 pounds.

load of from 50 to 400 pounds, confirm the deductions drawn from Fig. 3. The advisability of submitting this two-point type of radial bearing to thrust loads has been frequently questioned, and occasionally even the admissibility of doing that has been denied.

Fig. 5 gives a series of curves showing the friction in the conditions A, B, C and D. It will be seen that in every case the friction falls with an increase of load. It is generally reasoned that under thrust the balls must wedge between the curve races. Were that true, then the friction should not only be high, but, even though not equally high under all loads, certainly not decreasing under increasing loads. The curves bear out my reason in explanation. We know, of course, that under load there will be a deformation of the shape of balls and races, and that the theoretical point contact is actually a surface contact of small area. I assume that this surface has an average inclination which gives a blunter wedge than the geometrical angle of the theoretical point contacts. In Figs. 6 and 7, I have tried to show that Fig. 6 gives the wedge angle (b) for the theoretical contact point (a), with a thrust load applied to the race in the direction of the arrow. Fig. 7 shows the surface of deformation (d), with the larger wedge angle (e). As the load increases the deformation must increase; an increasing bluntness of the wedge angle with increasing load should therefore be accompanied by a decreasing frictional coefficient. This reasoning is confirmed by the trend of the curves of Fig. 5. Also, it has been observed that the thrust-carrying capacity of the heavy type of radial bearing is relatively less than that of the medium and light types. Now the heavy type has much larger balls and these will conse-

Fig. 5.—Results of constant radial load with variable thrust loads.

quently deform less under heavy loads; that means a smaller change from the theoretical wedge angle, and, therefore, a relatively greater friction; so that this observed fact may be taken in further confirmation of my reasoning.

Fig. 6.—Wedge angle with thrust load.

Fig. 7.—Deformation with large wedge angle.

General Deductions.—1. The two-point, annular, uninterrupted race ball bearing with elastic separators is efficient and durable under the legitimate conditions of work imposed on it in an automobile hub, which are not unusually severe.

2. Simultaneous radial and thrust loading is permissible and does not result in a material increase of friction as compared with radial loading only.

3. The bearing should be copiously lubricated; easiest running will be had with the least viscous lubricant; that, however, must not be so light as to escape readily, but must be retained by the mechanical arrangement of the hub.

4. Rust must be rigidly excluded, as it will result in breakdown of the bearing surfaces and of the carrying capacity.

5. Grit must be rigidly excluded, as it will result in a wearing away by grinding of the balls and races.

6. As between rust and grit, the former is the more dangerous, since it involves the destruction of carrying capacity, while grit merely brings about a faster wear than is desirable. Rust and grit are nearly always found associated, as the conditions admitting the one generally admit the other. Their combined influence is decidedly bad. Fortunately, both can be kept out by means which are available, simple and easily applied at small expense to automobile hub construction.

HORSE KILLS 3,900, MAIMS 19,500 YEARLY IN FRANCE

PARIS, Feb. 17.—Being the latest form of locomotion, auto accidents are emphasized in the press to such an extent that the average individual has a firm belief that the auto is the most deadly of all road vehicles. To such an extent has the belief grown in France, that automobile clubs throughout

horses and 250 injured in one year, without a single automobile accident occurring. Translated, the poster reads:

The truth about transportation accidents. Statistics of the Department of the Sarthe from October 1, 1907, to January 31, 1908 (four months):

Horses.	Automobile.
Number of accidents..... 89	Number of accidents..... 5
Number of deaths..... 15	Number of deaths..... None
Number of Injured..... 84	Number of Injured..... 5

Note.—The detailed accounts of all these accidents, registered according to commune and date, are at the disposition of the public every day except Sunday from 9 till noon, and from 2 to 7, at the Secretarial offices of the Automobile Club of Sarthe, 7 Boulevard Rene-Lavasseur, Le Mans. G. Durand, Secretary.

During 1906, the year in which the Grand Prix of the Automobile Club of France was run on the Sarthe circuit, there was not a single fatal automobile accident in the Sarthe.

Each year the horse kills an average of 50 persons and seriously injures more than 250 in this département.

The Department of the Sarthe having 58,000 horses out of a total of 4,521,000, horse transportation is therefore responsible, in the whole of France, for the frightful average and annual hecatomb of 3,900 persons killed, 19,500 injured.

THE NEWS FROM GERMANY.

BERLIN, Feb. 28.—The German Crown Prince has been enrolled at the Technical High School, Berlin, for a series of courses in machine building and will also devote attention to motor mechanics. He will be the first of his race who has chosen to be initiated into technical matters, although all members of the Hohenzollern family learn some profession.

His Majesty, the German Emperor, held a reception on February 12 for the autoists chiefly interested in the new Taunus track project, which was attended by several members of the government as well. Herr von Friedlaender-Field discoursed on the various track proposals, guided by plans, but the Taunus received the chief share of Imperial favor, and it is therefore safe to say that it will be put through as soon as possible, when funds will also be forthcoming. The track would commence between Gravenwiesbach and Brandobendorf and finish up at Oberinsel between the Saalbury and Holmartz.

The three Opel cars destined for the Grand Prix are now being tested and are doing well. Fritz Opel has achieved an average speed of 145 kilometers on his car in spite of bad roads. They were originally equipped with detachable wheels, but owing to the race regulations these have been done away with and dismountable rims put in their stead.

the country have set themselves the task of obtaining and publishing complete statistics in every district. The Automobile Club of Sarthe, the first to take up the work, has published broadcast the accompanying poster, from which it is seen that in an automobile racing district 50 people were killed by

LETTERS INTERESTING AND INSTRUCTIVE

MORE ABOUT BRAKING WITH THE MOTOR.

Editor THE AUTOMOBILE:

[1,204.]—I have been much interested in following the different articles in your paper which have appeared from time to time on the subject of using the engine for the purpose of braking the car on steep grades, and more particularly in the article of C. F. Redden, in your issue of February 20. I have followed the discussion very closely, but from all that I can gather there appear to be several inconsistencies in the directions as given by the several writers on the subject. In this article of Mr. Redden's, for instance, he states "In braking the car by means of the engine the greatest care must be used, and the car itself and the motor should be as nearly at the same speed as possible," while just above that he says "that the electric current should be switched off." Now I have driven a car for three years, and at present have a "30," but in all that time I am unable to locate a single instance where on coming to the top of a descent and cutting out the ignition my engine failed to come to a complete stop, then if the gears were shifted it would, of course, necessitate the letting in of the clutch and engaging the engine from a standstill, thereby causing quite a shock to the entire transmission in so doing. I take it, of course, that Mr. Redden means to change the gears and engage the clutch, cutting out the electricity, but his article does not make that point clear.

But the point on which I would like to have some clear information is this. I find in practice that on almost any ordinary grade I can hold my car down to a perfectly safe speed by simply closing the throttle tight, and I do not find that it makes any appreciable difference to cut out the ignition at the same time, nor can I see any logical reason why it should. It is a fact that with the car standing still and the engine running free that by closing the throttle entirely the engine will at once come to a stop. Now if that is the case, what is the use of cutting out the ignition when coming down a grade and using the engine to brake the car? If the engine will not run with the throttle closed when standing still why does it not give the same resistance on a down grade as it would if the ignition was cut out? I find in practice that on the majority of grades as found in running over the country that by the time the ignition is cut out and the car brought under control that the bottom of the grade is so nearly reached that one wants to withdraw the clutch and let the car run free for a time and then, of course, with the ignition cut out the engine at once comes to a standstill, then on again letting the clutch engage you have the unpleasant experience of a sudden jar to the whole transmission to start the engine, and the only way to avoid that is to wait until the car comes to almost a complete standstill, which is something that one does not like to do, especially if in the least hurry, or trying to make time.

But I would like very much to have some one explain just what the difference in braking power would be from the engine under the two different sets of conditions, viz., running with the throttle entirely closed and the ignition on, or running with the same conditions and the ignition cut out.

Any information on this point will be greatly appreciated in your "Letters Interesting and Instructive."

Richfield Springs, N. Y.

C. B. CONRAD.

If it be possible to bring the motor to a stop by closing the throttle when running free, the only thing to be accomplished by cutting out the ignition in coasting would be economy of current, in case a battery is employed as the source of current. The fact that a spark was occurring in the cylinder could have no effect whatever on the braking power of the motor when used in this manner, provided that the throttle closed sufficiently to prevent the inspiration of sufficient fuel to cause an explosion. Where the motor is to be used as an auxiliary brake on a long, steep descent, and it is valuable for this purpose to relieve the running brakes, we should recommend dropping into a low gear before getting over the brink of the hill, and then simply closing the throttle, as you state is your custom. On ordinary grades, it would scarcely be necessary to drop from high-gear, as the resistance of the latter would be sufficient for all ordinary purposes. Much less strain is put upon the motor by leaving the ignition current on, and gradually opening the throttle at the bottom of the hill, than would be the case where the throttle is left even partly open, and then the current is switched on. Many drivers, however, merely cut out the ignition.

HORSEPOWER AND VALVE-TIMING OF MOTOR.

Editor THE AUTOMOBILE:

[1,205.]—Will you kindly answer the following questions, which I am particularly interested in?

1. How many horsepower will a four-cylinder marine motor develop at 600 r.p.m., with a bore of 5.5-8 by a 6-inch stroke, and state what formula you have used and if the same can be used in rating automobile motors?

2. How much lead should the valves of this marine motor have and compare the same with the valves of a high-speed motor?

Chicago, Ill.

AUTO ENTHUSIAST.

1.—The indicated horsepower of the motor in question would be 23.04, the formula employed being as follows:

$$I. H. P. = \frac{D^2 \times L \times R \times N}{18,000} \text{ in which}$$

D = diameter of the cylinder in inches;

L = length of the stroke in inches;

R = number of revolutions per minute;

N = number of cylinders.

The denominator is a constant, calculated on the assumption that gasoline is to be employed as the fuel, and is given by Roberts. This formula is equally applicable to calculating the I. H. P. of automobile motors.

2.—The exhaust valve should begin to open at a point 18 to 20 degrees on the crank circle in advance of the lower dead center, closing when crank has just passed dead center, or 1 to 2 degrees. The opening of the inlet valve corresponds to the latter point and it remains open until the crank has passed the lower dead center, about 10 to 15 degrees. In a high-speed motor, running at 1,200 r.p.m., these factors would be increased to 30 to 35 degrees in the case of the exhaust, and 20 to 25 degrees in the case of the inlet, but it will be found that no arbitrary figures can be taken as a standard in this respect, automobile designers having departed almost universally from former standards by greatly increasing the valve diameter, which permits of leaving the valve closed a proportionately greater part of the stroke. With the small valves formerly used, the lift would be too great to make a high-speed motor either durable or silent, as the hammering would be excessive. Consequently, the valves have been made very large in order to permit of employing a minimum lift, and on the latter will naturally depend the amount of lead required in every case.

EFFECT OF LENGTHENING THE STROKE.

Editor THE AUTOMOBILE:

[1,206.]—Will you kindly answer the following questions? Does the length of the stroke of a gasoline engine make any difference in the power developed? It would seem that it does not by the A. L. A. M. formula, although a great many other formulae make use of it in computing the horsepower of a motor.

South Norwalk, Conn.

RUSSELL FROST, JR.

Both the power and the efficiency of an internal combustion motor are increased by lengthening the stroke, for the reason that the power created comes entirely from the expansion of gases raised to a high temperature and pressure by their rapid combustion, or explosion, as it is usually termed, though this is somewhat erroneous. As is well known, this pressure is extremely high at the moment of ignition, as shown by the almost vertical line of indicator cards, and the drop is likewise extremely rapid, as is evident from the form of a gas engine indicator card when compared with the sustained pressure line of a steam engine. As this pressure is the sole source of power, it will be evident that the greater proportion of it that is utilized, the greater will be the power developed per unit of fuel. To do this the stroke has to be lengthened in order to allow the hot gases to expand down to as near the atmospheric point as practical with an effi-

cient exhaust. It is common in stationary gas engine practice to make the stroke twice the diameter of the bore, but it is impracticable to increase the stroke of an automobile engine for the reason that the weight rises very rapidly with an increase in the stroke, and but little proportionately with an increase in the bore. Hence, the stroke seldom exceeds the bore more than a fraction of an inch, as the gain in power and efficiency is a negligible factor compared with the importance of keeping the weight down.

The A. L. A. M. formula does not take any account of varying lengths of stroke, for the simple reason that it is merely intended as a formula for "popular consumption," so to speak, and is only designed to give approximate results that may readily be calculated by anyone. To accurately compute the indicated horsepower of a motor a number of factors that do not appear in this formula must be employed. It is based on standards adopted from the characteristics of a number of American motors, and, as already mentioned, is merely an arbitrary rule for easy figuring.

EQUIPMENT OF NEW YORK-PARIS TOURISTS.

Editor THE AUTOMOBILE:

[1,207.]—Will you kindly, through "Letters Interesting and Instructive," let me know what comprises a Nansen kitchen and where it can be purchased. Also what make of windlass was carried by the De Dion auto in the New York-Paris run, as described in the last issue of "The Automobile."

Perth Amboy, N. J.

G. W. TYRRELL, M.D.

The type of cooking stove to be used by the De Dion crew in the run to Paris is the development of one employed by Nansen in his Arctic explorations, and known in a general way as a Nansen kitchen. The stove uses kerosene under pressure as fuel, by means of a Primus burner without wick. Experiments have proved that kerosene is the only suitable fuel for this class of work, alcohol being entirely too bulky. The vessels connected with the kitchen are all of a special aluminum alloy comprising copper and nickel. This gives minimum weight and a metal which will not burn out under the greatest heat obtainable from the stove. As it is supposed that water will never be available, frozen snow being used in its stead, this is an important feature. These outfits are procurable from high-grade sporting goods dealers in New York City.

The De Dion car was fitted with a small capstan, not a windlass. It was mounted on a stout board and carried when not in use on the running board of the car. When required to be brought into operation it could readily be mounted on the forward end of the frame in front of the radiator. We do not know the name of the maker of the capstan, the features of which were smallness, low gearing and operation by a lever transmitting power on both upward and downward strokes.

HOW CAN THIS LINING BE RENEWED?

Editor THE AUTOMOBILE:

[1,208.]—The folding top of my car is Pantasote, lined with a dark cloth like broadcloth—vulcanized on. The outside is in good condition, but the inside cloth lining has faded to a dark purple. Can you tell me if there is any known method of dyeing the cloth lining—while attached to the wires—either with a brush, sponge, or other method, or whether there is any way to restore the color or otherwise make the lining presentable? GEORGE A. FAY.

Meriden, Conn.

While we must confess ignorance as to exactly the method to be pursued in making such a renewal, owing to lack of experience, we should advise sending the top to the manufacturer, as we do not believe it is a job at which an amateur would shine to any great extent. If there be any manner of doing this without removing the old lining, which we doubt, probably some manufacturer of tops will come to our assistance and tell how it can be done to the best advantage, and his letter will be reproduced in this column.

METHOD OF HARDENING CAM FACES.

Editor THE AUTOMOBILE:

[1,209.]—Will you kindly advise me, through your valuable paper, the best way to harden cams? W. E. GARRABRANT.
Dallas, Tex.

The process employed for this purpose is known as "cementing" or "case hardening," and it requires the facilities of a well-equipped shop to perform properly. The parts are packed in iron boxes with carbon, and then brought to a determined temperature, at which they are maintained constantly for a number of hours, depending upon how deep the carbon is desired to penetrate the metal. This process causes more or less distortion of the parts, so that they are only machine finished before being subjected to it, being subsequently accurately finished by grinding. Where there are no facilities for such work at hand, cams may be roughly hardened by tempering, as soft steel, no matter how low in carbon, will harden to a certain extent, when brought to a red heat and then plunged into water. Using brine will increase the hardening effect slightly.

WHO CAN ANSWER THIS DEFINITELY?

Editor THE AUTOMOBILE:

[1,210.]—Would it be asking too much of you to tell us whether you know of any marine engine builders who abandoned four-cycle engines for the two-cycle? Any information you might give us on the subject would be greatly appreciated. PUGH BROS.
Providence, R. I.

We do not know of any such instance, and thought the fact was quite to the contrary, the two-cycle engine having been given up in the majority of instances where extreme speed was aimed at, as in most of the high-powered racing boats. As many motor boat enthusiasts are numbered among the subscribers of THE AUTOMOBILE, doubtless some of them may be able to supply the information desired, or at least more than we are able to furnish.

MORE ABOUT A MOTOR'S IMPULSE BALANCE.

Editor THE AUTOMOBILE:

[1,211.]—I beg to disagree with your answer to letter No. 1,188, January 30 issue, "Balance of Four and Two-cycle Engines." With cranks at 180 degrees, I claim it is impossible for No. 3 cylinder to be balanced by compression stroke of No. 2 cylinder, as you state in your letter. It looks to me as though No. 2 might be on the suction stroke about that time and No. 4 on compression. O. H. COLWELL.
Providence, R. I.

You are quite right; cranks numbers two and three, being in the same plane, always move together and naturally could not balance one another. It should have read number *four*, which, as you state, would be on the compression stroke.

WANTED: VIEWS OF OTHERS ON LUBRICATION.

Editor THE AUTOMOBILE:

[1,212.]—I was very much interested in communication No. 1,181, in "Letters Interesting and Instructive," concerning experience in lubricating the Ford engine, as mentioned therein. I have had considerable trouble myself; however, it was voluntary, inasmuch as while my car was new I desired to keep it flooded with oil so that there would be no chance of any cutting going on in the cylinders. I must admit that the idea of mixing oil, kerosene, and radium decarbonizer, and using this as a mixture for the crankcase would seem rather queer. As near as I can judge, kerosene cuts lubricating oil and destroys its lubricating qualities, and again the radium decarbonizer I take to be very much the same thing, and probably if anything it acts more strongly than the kerosene. This I do not know from experience, but I am under this impression. It would seem to me, therefore, that the fact that this correspondent's engine does not give trouble is probably owing to the great volume of the mixture. The writer has found that by using a rather light grade of oil, in a fairly liberal manner, say 40 drops per minute, has given him fine satisfaction and no trouble.

I should like very much to have the views of some other owners in reference to letter No. 1,181, as, of course, if this really does give satisfactory results in every way, including thorough lubrication of the engine, it would certainly be a good thing to know.

Philadelphia, Pa.

W. S. HEAGAMAN.

IN THE BEGINNING OF AMERICAN AUTOMOBILING

By CHARLES E. DURYEY.

THE first automobile racing event in America was due to the initiative and generosity of H. H. Kohlsaas, then proprietor of the *Times-Herald*, of Chicago. He was impressed by the showing in the great French event of the spring of 1895, and in June announced a series of prizes amounting to \$5,000 and a small gold medal, to be given to the most meritorious in a three-day auto event, to be held about November 1, 1895. The matter was kept alive in the columns of his paper and public interest stimulated as much as possible so as to attract a large entry list. A prize was offered for the best name for the new vehicle and after much deliberation "motocycle" was adopted. The fate of the word has proven how little the committee understood either horseless carriages or the automobile vocabulary.

Inventors sprang up like weeds in many small places, and each was sure he had the device that would get the big prize or at least one of the small ones. Eighty-three entries were secured, some entrants engaging several vehicles. The *Monitor* was built in ninety days; surely the same American talent was equal to the task of making successful self-propelled carriages in four months. It looked then, as it often has since, very easy to put together a motor and a buggy and take a ride. But, alas, there were some disappointed inventors and discouraged event-promoters when the time arrived and but three or four vehicles were on hand. Pennington, of airship and other hot-air fame; Mueller, who had imported a Benz rig; Duryea and one or two others constituted the small group. The others were keeping the wires hot explaining that they were almost ready, etc., etc.

How the First Race Was Lost.

The management saw nothing else to do but postpone, and this they did, naming Thanksgiving day as the next date. To console those present and recompense them somewhat, an exhibition run of fifty-odd miles over the course was held for a purse of \$500 to be divided equally among those who covered the course regardless of speed or time so long as it was in the same day. We could feel our half of that money bulging our pocket, for there was no real auto there that could cover that course in opposition to the Duryea, except the Mueller-Benz. It seemed so certain that the Duryea rig, which had been used by a green promoter all summer and had never been towed, would gambol over those fifty-odd miles on that beautiful Fall day in a most easy, pleasant manner, that my brother and I rode away with as much enthusiasm as a couple of school boys. We had a few spares and there did not seem to be anything likely to break that could not be repaired by either or both of us on the road if necessary. We ran away from the Benz and were going finely when our chain broke. This did not worry us, though it permitted the Benz to get ahead. We were soon after them and rapidly overhauling

a German farmer driving a light road cart. There was ample room to pass him on the left, as was our duty according to law, but we sounded our warning to let him know we were coming. This ruined us, as these legal warnings have often done since. He looked around and seeing us coming "like a railroad train" (about 12 miles per hour) decided he must get out of the way, so he took a short hold on the lines and pulled the outfit across the road to the left. This blocked our way, and rather than hit him we glided into the ditch which looked easy, being full of grass. Our front wheels dropped nearly out of sight and both hubs gave way. The Benz got all the money; the Duryea all the disappointments.

The Duryea went to the factory by freight; but was again present on Thanksgiving day. Chicago was in the grip of a blizzard. Trains were late or abandoned. Pedestrians sank

to the waist in some of the streets. Lincoln Park had not been traversed when the contestant entered it. There were more entries, however, than on the first occasion. A show room at Sixteenth street and Wabash avenue served as headquarters, and as the streets became more passable, some demonstrations were given. Haynes had his second vehicle there. Morris & Salom had two electrics, which were the first of the long series of the Electric Vehicle Company. Lewis had a friction drive which he very carefully guarded. It was the predecessor of the Searchmont. In all there were eleven who took starting numbers. The weather had moderated enough to soften the snow on top but at night this froze into a crust hard enough to support pedestrians and sleighs. The next morning was snappy cold. A starting spot had been scraped free of snow in Jackson Park. Some of the starters arrived on trucks, some under tow and some, like the Haynes, did not arrive. Only five lined up. The Duryea had run out without trouble

and seemed to be a good road breaker so it was sent off first. The others followed quickly, but as they came to the slight rise leading on to the old Midway Plaisance it was noticed that there was trouble. A run to the spot showed all but the Duryea stalled in the snow. Salom voiced the common sentiment when he said "It's against the rules to be pushed, but you had better lend us a hand, boys." So they were pushed and not only once but many times during the day.

Few Starters, Fewer Finishers in First American Race.

The course lay through the city and to the north, then back to the city and out northwest, then back to the start through the parks on the west side. Total distance 54 miles. The electrics were quickly out of it. The Macy Roger, a French rig, made a hard fight and covered probably forty miles. The Benz operator fainted from exhaustion but the rig was driven in by Chas. B. King, now of the Northern, and abandoned at the finish line. The Duryea had two small breakdowns,

Charles E. Duryea and His Brother, J. Frank Duryea.

The car shown is the one which won the *Times-Herald* race of 1895, the first automobile race ever held in the United States. Charles E. Duryea is the pioneer of the American industry in this country, and J. Frank Duryea is the designer of the Stevens-Duryea car.

one of which was distinctly traceable to the original accident, but in spite of the delay caused by these, it won the contest. Its operator drove back to the storeroom with no sense of physical exhaustion. It was the only rig to cover the course and transport itself both from and to its quarters on the same day. Total distance about 70 miles. Many modern rigs with their small wheels could not do such a feat. The first prize, \$2,000 cash, was awarded to the Duryea, which for years was the only American rig that had proven able to defeat foreign-built vehicles. That this was not accidental, but a reality, was amply shown by other Duryea rigs winning the second American event at New York the next spring and by running away from the French victors of '96, in the Liberty Day run at London, on November 14, 1896.

The effect of this contest on the budding industry was peculiar. The inventors found themselves not ready even for the New York event, and many of them fell out, surprised at the severity of the problem and disgusted with its difficulties. The carriage makers came expecting to see carriages with a push-button on the seat and a door-bell battery under it. They found a whole power plant and went away convinced that it would never do for their trade. The cycle user could only see steel wheels and rubber tires, and condemned all else,

and later got his fill of toys in the shape of the little steamers which he snapped at so eagerly when they were thrown on the market. The public generally were disappointed at the slow time made (because of the snow and the accidents, about 8 miles per hour), and ridiculed the performance and the promoters. The few thinking ones saw that it had answered for ever the question "What will they do in winter?" and had proven superiority over the horse. It had also confirmed the gasoline men's claims as to the superiority of gasoline motors for this work and those willing to see did not need another lesson.

Twelve years later we see the motor buggy just getting a very tardy recognition of its merits, and yet we, as a people, pride ourselves that we are up-to-date and can see through a ladder. There was enough in that first run to prove conclusively the value of the buggy type, but few could see it.

That Duryea rig weighed under 1,200 pounds. It had 44 and 48-inch wheels, with 2-inch hosepipe tires. The motor was a two-cylinder, four-cycle, located at the rear. It had three speeds forward and single chain drive to a live rear axle. Why the makers went to France for their models when the public have been all these years waiting for something like this is a question not very easy to answer.

GRAND PRIX TO BE GREATEST RACE EVER HELD

PARIS, March 1.—One hundred and five automobiles are officially engaged for the two races on the Dieppe course, July 6 and 7. Forty-five of these are entered for the Grand Prix, and 60 for the small voiturette contest on the preceding day. During the last twenty-four hours Brasier, who had been looked upon as doubtful, sent in the official entry of three cars, to be driven by Thery, Baras and Bablot; Itala put in a team of three, and Porthos, a French firm with factories near Paris, entered two cars. The 45 champions are distributed among six nations, France having 20, Germany 9, England 6, Italy 6, Belgium 3 and America 1. The firms represented are:

FRANCE.—Panhard (3), Motobloc (3), Dietrich (3), Renault (3), Bayard-Clement (3), Brasier (3), Porthos (2).

GERMANY.—Benz (3), Mercedes (3), Opel (3).

ITALY.—Fiat (3), Itala (3).

ENGLAND.—Austin (3), Weigel (3).

BELGIUM.—Germain (3).

AMERICA.—Thomas (1).

With the exception of the Italian Isotta-Fraschini team and the Swiss Martini cars, all the contestants in the voiturette race are French. As the ordinary entrance fee for the runabout race is the modest one of \$100 per car, it is quite likely that the already long list will be still further increased by half a dozen late entries at double fee. Most of the firms

engaged in the voiturette race are exclusive builders of small cars, the only exceptions being Isotta-Fraschini, Pilain, Martini and Aries.

In engagement fees the secretary of the Sporting Commission of the French Club has received \$42,800, this sum covering 45 Grand Prix racers, 60 runabouts, 5 tire stations, one oil stand, and a reserve space for the Bosch Magneto Company. The Racing Board income is further increased by the Dieppe subsidy of \$10,000, making already \$52,800. This will, of course, be very largely augmented by advertising spaces on the course and grandstand admissions.

Expenses, however, in connection with a race of such magnitude will be enormous. It is estimated that grandstands and accessories alone will cost from \$20,000 to \$25,000. Over 38,000 yards of fencing have been ordered to protect the course at every cross road and wherever people are likely to congregate, and in addition 9,000 yards of solid wood barricading will be erected. The wooden bridges across the course will be the same as last year, and will be erected at the same places.

It is declared authoritatively in Paris that Kronprinz William will attend the Grand Prix races incognito. The matter is at present in the hands of the ministers of foreign affairs at Paris and Berlin, and appears likely to be brought to a successful termination.

THOMAS PARIS CHAMPION A STOCK CHASSIS.

It is not the Brighton Beach 24-hour racer which is taking part in the New York to Paris tour as the representative of America, but a stock chassis which had been promised for shipment to the Whitten-Gilmore Company, agents for the Thomas Company in Boston. No car was available, and on request the Boston dealers released this machine.

No changes whatever were made on the chassis, declare the Thomas people, other than a steel bar placed across the frame connecting the two front spring hangers. This was not added to strengthen the car, but to furnish a suitable attachment for a rope, should it at any time become necessary to hoist the car by means of block and tackle. The car had not been run or tested more than other Thomas Flyers.

MAXIM'S MUFFLING LEADS TO SILENT GUN.

HARTFORD, CONN., March 2.—Hiram Percy Maxim, who has been closely identified with the development of both the electric and the gasoline automobile from their very inception in this country, has just been granted a patent on a silent firearm, the invention of which he attributes to the result of long study of efficient methods of muffling the exhaust of a gasoline motor. The device consists of an automatic valve placed near the muzzle of the gun and which is closed by the pressure of the gases, once the bullet has passed, the remaining gases under pressure then being allowed to escape slowly through small perforations, giving rise to nothing more than a slight hissing, which is not audible more than a very short distance away from the gun.

A MILLION GRANGERS WANT FEDERAL ROADS AID

CONCORD, N. H., Mar. 2.—The National Grange, an organization of farmers in twenty-seven States, with an aggregate membership of nearly one million members, has for a number of years advocated the enactment by Congress of legislation creating a National Highways Commission and making liberal appropriations for the improvement of the public roads. During the past year the grange has perfected plans for conducting a widespread, systematic, educational campaign for the purpose of showing the urgent necessity for the adoption of a broad, comprehensive policy of public highway improvement by the various township, county and State authorities, and to induce the National Government to lend its assistance to a movement intended to secure the establishment of a complete system of properly constructed roads in all sections of the country.

It is contended by the members of the grange that the improvement of our highways is as equally deserving of Federal appropriations as is the improvement of our waterways, and that the work of the proposed National Highways Commission would greatly stimulate the construction of better roads by the various States, counties and townships. The splendid road system of France, admitted to be the best in the world, is declared to be due chiefly to the road policy of the French National Government, under which a corps of highly trained engineers plan and direct the work of constructing and maintaining the principal roads of that country.

The deplorable condition of most of the roads in the United States, probably the worst in any civilized country, is generally recognized, and it is urged by the grange that it is high time that action should be taken by the National Government to bring order out of the existing chaotic conditions and substitute a scientific policy of road construction and improvement for the haphazard methods which now prevail to so large an extent.

The following resolutions unanimously adopted by the National Grange give the point of view from which the farmers regard the question of Federal aid to public road improvement:

Whereas, The improvement of the highways of the country is a matter of general public concern, and should properly receive the attention and assistance of the National Government, and

Whereas, The revenue raised by taxes paid by the people of the country as a whole should be devoted as far as possible to purposes which will benefit the greater number of the taxpayers in all sections of the country, and

Whereas, No argument can be advanced in favor of the annual appropriations by Congress on behalf of river and harbor improvements that does not apply even more strongly to the improvement of our public roads; therefore,

Resolved, That the National Grange favors a general policy of good roads construction by the various municipalities, counties and States, and

Resolved, That we favor the immediate enactment of legislation by Congress making liberal Federal appropriations for the improve-

ment of the public highways of the country, these appropriations to be expenses in such manner as Congress may prescribe.

House Bill 15837, introduced in Congress on January 30, 1908, by the Hon. Frank D. Currier, of New Hampshire, embodies the principle of creating a National Highways Commission and of Federal aid for public road improvement, unanimously approved by the National Grange at successive annual conventions and was carefully drawn to meet objections raised against previous bills for the same purpose.

By decisions of the Supreme Court of the United States it is held that the National Government has power to construct, maintain or improve roads in the various States used in interstate commerce, and all roads leading to or connecting therewith. It is therefore practicable under this bill for the proposed highways commission to aid in the construction or improvement of any road in any part of the country, since all roads connect with, or lead into, some other road used in interstate commerce.

It is provided in the bill that the commission shall, as far as possible, act in cooperation and consultation with the authorities having charge of the construction and improvement of the public highways of the several States, and in accordance with this provision the distribution of the amounts appropriated will be governed by the wishes of the people of the States, acting through their public road officials. Under this policy there will be no danger of some roads in certain sections of the country receiving more than their fair share of the Federal appropriation, since the people of each State can be relied upon to see that their highway authorities insist on the expenditure of these appropriations for the best interests of the States, as a whole.

The bill also provides that not less than \$500,000 out of the total appropriation of \$50,000,000 shall be expended in each State of the United States, this amount to be expended in each State at the rate of not less than \$100,000 annually. This insures the smaller States against discrimination in favor of the larger or more densely populated States, and will prevent anything like favoritism in the distribution.

The enactment of this bill will inaugurate a national policy of road construction and improvement which will ultimately result in giving the entire country a system of permanent public highways, constructed after the most scientific methods under the joint supervision of the National Highways Commission and the various township, county and State authorities. The engineers and construction staff of the commission and the appropriations made by Congress will be available for aiding in the improvement of any roads in any part of the country, and the roads so improved will be a constant inducement to each community to cooperate in making our road system what the wealth and intelligence of our people entitle us to have—the best in the world.

A Bill to provide for the creation of a National Highways Commission, and for the construction, improvement, and maintenance of public highways.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That this Act shall include within its provisions any and all public highways within the territory of the United States which, in the judgment of the commission hereinafter created and constituted, might be constructed, improved, or maintained to promote interstate commerce and trade and the postal service of the United States.

Sec. 2. That a commission is hereby created to be called the "National Highways Commission," to consist of three commissioners. The President of the United States shall, by and with the advice and consent of the Senate, appoint three commissioners, who shall have a practical knowledge of road building and construction.

Any vacancy which may occur in the commission shall in like manner be filled by the President; and he shall designate one of the commissioners to be president of the commission. Each of the commissioners appointed shall receive as pay and compensation for his services five thousand dollars per annum. The commissioners shall remain in office subject to removal by the President for inefficiency, neglect of duty, or malfeasance in office.

Sec. 3. That it shall be the duty of said commission to take into consideration, formulate, and adopt such plan or plans for the improvement, construction, and maintenance of such public highways, the improvement, construction, and maintenance of which shall, in the judgment of the commission, acting in co-operation and consultation as far as possible with the duly constituted authorities having charge of the construction and improvement of the public highways of the several States, promote and facilitate interstate

commerce and trade and the postal service. The said commission may, prior to the completion of all plans and surveys contemplated by this act, proceed to such immediate work as in the judgment of said commission may constitute a part of the general system of works herein contemplated.

Sec. 4. That it shall be the duty of said commission to superintend and direct such works as are herein contemplated, and to carry into full execution such plan or plans for the construction, maintenance, and improvement of public highways as may be devised and adopted by the commission as herein contemplated, and to make such additional surveys and investigations and mature such additional plan or plans and to carry the same into full execution as may be deemed necessary to construct, improve, and maintain a system of public highways, advantageous for the purposes of interstate commerce and trade and the postal service, and to accomplish the object of this act.

Sec. 5. That the commission herein constituted and appointed may cause proceedings to be instituted in the name of the United States in any court having jurisdiction of such proceedings for the acquirement by condemnation of any land, right of way, or material needed to enable it to maintain, operate, and prosecute works for the construction, maintenance, and improvement of public highways, for which provision has been made herein, and to construct, improve, and maintain such public highways. Such proceedings to be prosecuted in accordance with the laws relating to suits for the condemnation of property for a public purpose of the States wherein the proceedings may be instituted: Provided, however, That when the owner of such land, right of way, or material shall fix a price for the same, which in the opinion of the commission shall be reasonable, the said commission may purchase the same without further delay: And provided further, That the said commission is hereby authorized to accept donations of land, rights of way, or material required for the maintenance and prosecution of such work.

Sec. 6. That there is hereby appropriated, out of any moneys in the Treasury of the United States not otherwise appropriated, for

the purpose of carrying out the provisions and objects of this act the sum of fifty million dollars. The sum of not less than five hundred thousand dollars out of such appropriation shall be expended in each State of the United States, said sum of five hundred thousand dollars to be expended in each State at the rate of not less than one hundred thousand dollars a year. The said appropriation of fifty million dollars to be available at the rate of ten million dollars a year during the years nineteen hundred and eight, nineteen hundred and nine, nineteen hundred and ten, nineteen hundred and eleven, and nineteen hundred and twelve. If any of the appropriation herein made is not expended in the year named that portion not expended shall become available in the succeeding year or until expended.

Sec. 7. That the commission herein created and constituted shall superintend, control, and expend for the purpose of this act all appropriations herein made, or which hereafter may be made for said purposes, or so much thereof as shall be necessary, and shall prepare and submit through the president of the commission, to be by him transmitted to Congress at the beginning of the regular session in December of each year, a full and detailed report of all its proceedings and actions and of all such plans and systems of work as may be devised, in progress, or carried out by it, and of all such additional plans and systems of work as may be devised, matured, and adopted by it, with full detailed estimates of the cost thereof, and a statement of all expenditures made by it; and the Secretary of War may detail from the Corps of Engineers, or other corps of the army, an officer or officers to aid them in their work, who shall serve without additional compensation to that now allowed by law; and all moneys hereby or hereafter appropriated shall be expended under the direction of the Commission in accordance with the plans, specifications, and recommendations formulated, matured, and adopted in accordance with the provisions of this act.

Sec. 8. That this act shall be known as the "National Highways Act," and shall take effect at the expiration of thirty days after its passage by Congress.

THAT IRIDESCENT DREAM OF A TRANSCONTINENTAL AUTOWAY

INTEREST has been aroused in automobile circles by the movement started by ex-Congressman William J. Coombs, former director of the Union Pacific Railroad and president of the Municipal Art Society of New York, to obtain a general expression of the sentiment of the country in regard to having the United States government build a great transcontinental railway from the Atlantic to the Pacific ocean, on part of which public highway it is also proposed to construct a transcontinental automobile road, extending from ocean to ocean.

Mr. Coombs disclaims any intention to have the government operate the road, but simply to furnish trackage which can be availed of by any existing road or roads to be hereafter constructed, or by any freighter by the payment of tolls and compliance with general regulations. A reason for this movement, as urged by Mr. Coombs, is that there is not available capital enough in the country to provide trackage to meet the growing wants of its commerce.

It has been suggested to Mr. Coombs that the automobile interests of the country were very large, and that this scheme of a great transcontinental railway might be made more attractive, provided that upon this strip of land a great national automobile road could be constructed.

Mr. Coombs says he has had some hesitation in proposing such an automobile road, as it might savor of a bid for the support of particular interests. At the same time, he recognizes the fact that automobiles have come to stay, and that everything that would divert their traffic from the ordinary roads of the country would be of great benefit to the country in general, while the comparatively small amount of land required for the construction of this automobile road would be no hindrance to the construction of the proposed trackage. In fact, in deciding upon the amount of land required, Mr. Coombs had had this in mind. Mr. Coombs goes on to say:

"The use of this automobile road would, of course, be under the same regulations as far as tolls and general man-

agement is concerned as the railroad. Private enterprise would provide for supply stations and hotel accommodations. The variety of country and scenery that would be embraced in a trip across the continent over such a road could not be duplicated in any country in the world. The location of the automobile road upon the strip of land would be upon the edge of it so as not to interfere with the main feature, to wit, the necessities of the railroad. This transcontinental railway could be built by the government much more economically and with less wastage to the resources of the country than by private enterprise. As to the route, after many years of thought on the subject, I have decided that the route which would most effectively serve the greatest interests of the country lies along the parallel of 42 degrees, from the Atlantic to the Pacific ocean, or as near that as the physical conditions would permit. The road would extend across the States of New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Iowa, Missouri, Nebraska, Colorado, Utah, Nevada and California. Under the provision of the constitution providing for postroads and military roads, the government would be authorized to condemn a strip of land approximately one-half mile in width over the whole distance of the main line upon which sufficient trackage could be laid as the wants of the country called for to provide for fast trains, slow trains, and sidings. I would avoid as far as possible the touching of cities where the terminals and right of way would be expensive. As to the extraordinary amount of land that this plan would call for to condemn and the great expense to be incurred, that is a matter of no consideration in view of the great interests involved."

Evidently Mr. Coombs overlooks the fact that railroads derive their support from the country through which they pass as well as the large cities comprising their terminals, though his proposal to avoid cities might be subject to modification, particularly as he states that the cost of carrying out the work is immaterial in view of its importance.

FEATURES OF THE WORLD'S MOST FAMOUS FLYER

BETWEEN the automobile and the flying machine there is a much more intimate connection than is generally supposed by the public, which sees in the one a means of locomotion over highways and in the other a possibility of securing the conquest of the air. Without the gasoline motor the dirigible balloon would still be an impossibility. But for the same motive power the aeroplane would never have got beyond the stage of the box kite.

Henry Farman, who, like the majority of those at present struggling with the problem of aerial navigation, was an automobilist before he became an aeronaut, has done so much to develop

should thus have a big bearing surface, should be light and should have a rapid rate of travel.

From the accompanying drawings, reproduced from *Omnia*, the general characteristics of the Farman aeroplane are readily perceived. Overall measurements, according to the same review, are 44 feet long, 32 feet wide, 118 inches high, and total weight in running order 1,168 pounds. The flying machine is composed of five distinct parts: the forward frame carrying the motor and pilot, the chassis or supporting frame, the forward plane, the uniting beam, and the rear plane. The forward frame is a kind of wood cradle strengthened with metal stays, the function of which is to carry the motor, the pilot and all operating mechanism.

At the front of the forward frame is what is known as the equilibreur, a double rectangular plane, the angle of which may be varied at the will of the operator. It is by the variation of this angle that the aeroplane is made to rise or descend, as desired. Normally the flying angle of the Farman machine is seven degrees. Lateral movement is obtained by the vertical plane at the rear of the apparatus, the principle being that of a boat's rudder.

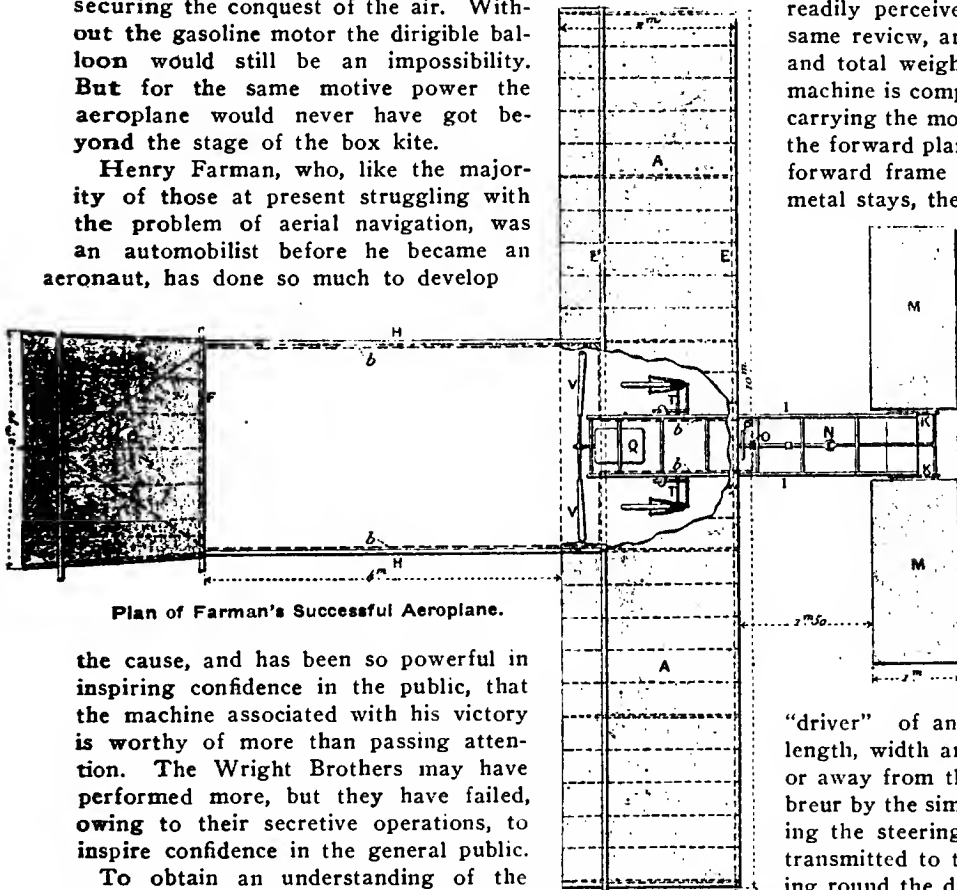

Aeroplane Piloting Is Complicated.

Though the steering wheel is in external features identical with that of an automobile, its operation is not the simple one known to every driver of a car. The

"driver" of an aeroplane has to steer in three directions: length, width and height. The steering wheel slides toward or away from the driver, thus raising or lowering the equilibreur by the simple transmission shown in drawing. By turning the steering wheel to right or left lateral movement is transmitted to the rudder through the flexible cable *b* winding round the drum *O*.

The motive power of the aeroplane consists of a 50-horsepower eight-cylinder water-cooled Antoinette motor running at 1,050 revolutions a minute, and capable of driving the aeroplane at a speed of 40 miles an hour. The two-bladed propeller has a diameter of 90 inches and is constructed of aluminum. A rising movement is obtained as soon as the speed reaches 36 to 40 feet a second.

Steel tube is used exclusively for the chassis, designated in the sketch by *T*. It is this chassis, equipped with bicycle wheels which has to carry all the weight of the aeroplane when a start is made by a preliminary canter over

Plan of Farman's Successful Aeroplane.

the cause, and has been so powerful in inspiring confidence in the public, that the machine associated with his victory is worthy of more than passing attention. The Wright Brothers may have performed more, but they have failed, owing to their secretive operations, to inspire confidence in the general public.

To obtain an understanding of the Farman machine, it should be borne in mind that it, like all other aeroplanes, is of the heavier than air class, that it has no sustaining gas bag, and that it can only remain afloat so long as it is in motion. Three fundamental principles underlie all machines of this nature: The effort of the wind or the motor necessary to raise the aeroplane decreases with the increase of the bearing surface and the decrease of weight; power of rising in the air increases with the force of the wind or the speed with which the apparatus is driven through the air; in proportion as the angle of attack is decreased (the angle formed by the horizontal and the line of travel of the aeroplane) the power necessary to keep the apparatus afloat is diminished. An aeroplane

Elevation of Farman's Aeroplane.—A, upper forward plane; B, lower forward plane; C, upper rear plane; D, lower rear plane; H, steel frame uniting forward and rear cells; I and J, forward frame carrying motor and pilot's seat; M, equilibreur; O, steering wheel operating rudder and equilibreur; Q, 50-horsepower, eight-cylinder Antoinette motor; R, water tank; S, gasoline tank; T, chassis on which steering wheels are mounted; U, springs; V, aluminum propeller; X, rear wheels; Y, rudder; Z, pilot's seat on storage battery case; b, cable operating rudder; c, ignition control.

the ground. The wheels are pivoted to run on the ground at any angle and are necessarily subjected to severe strains when the 1,000-pound apparatus descends to earth; yet so satisfactory is the construction that after more than 300 descents the chassis and wheels are in perfect condition. The pair of wheels at the rear, also mounted on coil springs, are merely intended to prevent the tail dragging on the ground during preliminary runs.

The forward cellular bearing surface, which may be compared to the wings of a bird, is formed by two long, curved surfaces of varnished canvas, parallel and about 60 inches apart. A dozen bamboo uprights unite the two surfaces, and laths at short intervals support the canvas covering. The two bearing surfaces are curved in length and width, this form offering a certain resistance to the escape of the air and thus increasing the sustaining power of the aeroplane.

Four tubes, reinforced by uprights and wire stays, unite the forward cell to the rear cell or tail, the function of which is to act as a counter weight or ballast of the forward part. It may, with considerable accuracy, be compared to the tail of a kite. This rear cell is much smaller than the forward one, the width being only 8 feet instead of 32. Its four lateral surfaces are covered with varnished canvas, the front and rear being left open to allow the free passage of air.

It is this huge box kite, equipped with a gasoline engine and manned by an automobilist, that has proved to the world the possibility of aerial navigation. Farman, who has the additional distinction of having achieved success on his very first flying machine, believes with all aeronauts that the ultimate complete conquest of the art of flying is but a matter of time. Unlike many untamed enthusiasts, however, Farman realizes present limitations; his machine has flown, and flown over such distances as to prove its worth, but the flights were only the feeble efforts of a fledgling.

RENAULT AIR-COOLED ENGINE FOR FARMAN.

Henry Farman, the champion of the aeronautical world, announces that his new aeroplane will be fitted with an air-cooled engine, instead of the eight-cylinder water-cooled motor used for some time past. He has found a change necessary owing to the difficulty of carrying a sufficient amount of water for a lengthy flight, and the handicap of piping, radiator and pump, which, however lightly they may be constructed, all add to the weight of the flying machine.

The next aeroplane will be fitted with a specially designed eight cylinder, air-cooled Renault engine of 3.5 by 4.7 bore and stroke. Horsepower is stated to be 45 at 1,500 revolutions per minute. Total weight is 286 pounds, which would appear at first sight not to be as advantageous as has been obtained by other makers, but this is the exact weight in running condition, and includes magneto and everything connected with the cooling system.

Eight-Cylinder Renault Aero Engine for Farman.

The eight cylinders, provided with radiating flanges over the entire length of the combustion chamber, are arranged in V, the two groups of four being disposed in such a manner that two connecting rods are attached to one throw of the crankshaft. This arrangement reduces the length of the crankshaft, diminishes weight, and, though there is no fly-wheel, the engine is perfectly balanced. Except that they are somewhat lighter than usual, the pistons are similar to those used on the standard water-cooled engines, and are fitted with the same circular groove in their base, pierced with holes to prevent oil passing from crankcase into combustion chamber.

All valves are operated by a single camshaft, machined out of the solid. The exhaust valves, placed above the inlet valves in order to obtain a higher compression, are operated by overhead rocker arms. Spark plugs are placed between

Valve and Intake Arrangement of Renault Air-Cooled Engine.

the two valves. In the matter of lubrication the air-cooled engine is in every respect similar to the water-cooled variety constructed by Renault.

Some successful constructors of aeronautical engines have abolished the carbureter in favor of a system by which the gasoline is injected direct into the cylinders. According to the Renault engineers, the slight gain in weight is offset by the irregularity of working and the largely increased consumption. More gasoline being consumed, a greater quantity has to be carried, necessitating a larger tank and thus making the two systems equal on the basis of weight. The standard Renault carbureter has therefore been retained, but considerably lightened by being entirely constructed of aluminum.

In the matter of ignition, too, a little weight might have been saved by adopting dry cells or storage batteries, but it was preferred to use a high-tension Bosch magneto, similar in principle, but smaller and lighter than those used on the cars. As can be seen from the illustration the magneto is carried in an accessible reversed position below the forward end of the crankshaft.

The cooling system comprises a couple of fans revolving in a light metal casing covering the entire engine. The cooling air drawn into the housing by the forward opening completely encircles the engine and is driven out at the rear. The two cuts of the engine show it with and without metal casing.

SOME AMERICAN TAXICABS.

The production of taxicabs, a field of activity with enormous possibilities, is now receiving very close attention by some of the more important and best equipped American factories. Vague announcements regarding intentions of building this special type of automobile have not been lacking for the past six months, but it is during more recent days that the actual cars have made their appearance.

The H. H. Franklin Manufacturing Company has entered the taxicab field, naturally with an air-cooled car. The town vehicle is built on the Franklin 16-horsepower chassis, which has a four-cylinder engine with jump spark ignition, current being supplied from a storage battery. Wheelbase is only 92 inches, which makes the car an especially easy one to handle in crowded city traffic. Transmission is of the progressive type, and final drive through rear live axle, as in all Franklin models. A landaulet body, elegantly upholstered in soft black morocco, the most sanitary material for public service, is provided for taxicab service, the model being known as G landaulet. A number of these cars are now being tested in public service. One of their most valuable features is their low weight and consequent low tire and gasoline upkeep. The machine is declared to weigh but 1,850 pounds.

Chicago will receive the first of the Elmore taxicabs now under construction. The standard 24-horsepower chassis, with its wheelbase shortened to 102 inches, has been adopted. The power plant is a three-cylinder two-cycle valveless engine capable of driving the cab on a gearing of 3 1-2 to 1, at speeds varying from 4 to 30 miles an hour. Total weight of the taxicab is declared to be less than 2,300 pounds. Provision has been made in the landaulet for three inside passengers. The inside height of the body is 60 inches, and width 40 inches. Between the front and rear seats the width is 27 inches. Upholstering is furnished either plain or in biscuit pattern, in cloth or leather. Arm straps are provided, the doors are opened by inside latches, and both the front and door windows are of the drop pattern. The regular color of the Elmore taxicab is dark green with a light, red stripe.

In the new Northern coupé, the Northern Motor Car Company, of Detroit, Mich., has produced an elegant town vehicle to compete with the electric for silence and flexibility while having all the endurance powers of the high-grade gasoline automobile. The power plant is a 24-horsepower motor under a bonnet forward, and is remarkable for its silent operation. The change speed lever has been placed under the steering wheel in order to group all the operating mechanism and give easier control for city work. The body is a handsome example of the coachbuilder's art. It has large, roomy doors, wide seats, is comfortably upholstered, has adjustable beveled plate glass windows front and rear, and is lighted by an electric dome light. The standard finish is black, handsomely striped.

One of the first firms, either here or abroad, to enter the field with an air-cooled taxicab is the Oscar Lear Automobile Company, builders of the Frayer-Miller car. The taxicab is fitted with the Frayer-Miller 24-horsepower air-cooled engine, its cylinders measuring 4 1-16 by 5 1-8 inches bore and stroke. Flexibility being a primary requirement of a taxicab, the Frayer-Miller has been geared so that practically all its work may be done on the high gear. The Standard Roller Bearing Axle Company's axle of the heaviest type, with sliding gear transmission as an integral part of the axle, has been employed. This provides three speeds forward and reverse. Wheelbase is 100 inches, tires employed are 32 by 4 inches. The Frayer-Miller patented fenders are employed, as will be seen from illustration, in order that the body of the vehicle may be thoroughly protected from mud. Accommodation is provided for four passengers, two on the rear seats and two on the forward drop seats.

A Texas Automobile Product, the "Dixie."

TEXAS ENTERS THE MANUFACTURING FIELD

From out the southwest come two new claimants for honors in the moderate priced class, and to judge from their specifications, there is little doubt but that they will succeed in carrying them off. To be more definite, they are the "Dixie" and the "Dixie Flyer," and they hail from Houston, Tex., where the Southern Automobile Company is a pioneer firm in this line. Both cars are built on the same chassis so that a description of the Dixie, which is a touring car, as will be evident from the accompanying photograph, will suffice in large measure for both. Its power-plant consists of a 28-30 horsepower, four-cylinder, four-cycle motor of standard design and construction, carried directly upon the main frame, no sub-frame being employed. It is also equipped with standard accessories of high-grade, a Schebler carbureter with piston throttle, being fitted, while an approved type of force-feed lubricator takes care of this essential. Ignition is of the high-tension type, a six-volt, 60-ampere hour battery being supplied as part of the regular equipment.

The clutch is of the multiple-disc type, contained in the flywheel, while the gear set is of the sliding type acting on the progressive method, a departure being noted here in that only two forward speeds are provided. On the high, the car is geared 3.2 to 1, and on the low 6.6 to 1, or about the same as the intermediate ordinarily used, the flexibility of the motor, which gives the car a speed of from 4 to 50 miles an hour on the high, being depended upon to take care of any other changes. Final drive is by propeller shaft. The front axle is tubular with a three-inch drop, while the front hubs are equipped with ball-bearings. Two sets of brakes centered on drums on the rear wheels are fitted, being of the internal expanding and external contracting type. The wheel-base is 102 inches and the tread standard. The tire equipment consists of 32 by 3 1/2-inch tires on all four wheels and any standard make of clincher tires will be supplied. A 15-gallon fuel tank is fitted. Both types list at \$1,500, with tools and oil lamps. Gas lamps and speedometer are \$150 extra.

Intake Side of the Motor of the "Dixie."

GOGGLES FOR DRIVING IN SNOW AND RAIN.

As all automobilists are aware, nearly every type of goggle yet invented has unfortunately to be abandoned when it is desired to drive fast through rain or snow. If the goggles are retained it soon becomes impossible to see through them, and if they are abandoned the driver suffers much inconvenience, the effect of rain or snow on the eyes at any speed above 25 miles an hour being painful.

To overcome this inconvenience a French inventor has produced a special type of goggle known as the L. I. M., an illustration of which is shown herewith, but which can be more completely understood by a reference to the line drawing, reproduced from *L'Automobile*.

The goggles consist of two opaque tubes *a* joined at the forward end so as to be convergent. The two tubes are mounted on the usual soft leather guard designed to fit close to the face, so that no currents of air can penetrate to the eyes. The upper half of the face of each tube is closed by

Sectional View of L. I. M. Rain-proof Goggle.

an opaque plate *d*, leaving the lower half open. To increase the range of vision the lower surface of each tube is cut away. Within each tube and behind the forward shield is a second inclined opaque shield *e* and a glass shield *f*, there being sufficient open space between *e* and *f* to give the neces-

Goggles Designed to Protect Against Bad Weather.

sary range of vision under all ordinary circumstances. This range of vision is increased in wet weather by another range through the glass *f*, giving a view of the dashboard, bonnet and wheels of the car.

Protection against rain is obtained in the following manner: rain falling on the shield *d* in the direction of the arrow, or in a more or less oblique direction, drips down to the lower edge of *d*; under the combined influence of the wind and their own weight, the drops of rain are detached from *d* and carried inward until they strike the lower inclined glass shield *f*; then run down the surface of this to the lower part of the tube and finally escape through a hole *h* made for this purpose. In the rare case where a drop of rain managed to pass through the opening between the two guards, its rate of travel would be so slow that it would not reach the eye. Three different types of goggles are made with ranges of vision for speeds of 90, 40 and 25 miles an hour.

New Stretch of Shell Road Built for Savannah Races.

Homestretch from Grandstand—Trees to Be Removed.

ALL READY FOR SAVANNAH.

SAVANNAH, March 2.—In making every effort to secure the complete success of the two-day races on March 18 and 19, the Savannah Automobile Club has in view the obtaining of the Vanderbilt Cup race for its short but excellent course. The receipt of the news that the Racing Board of the American Automobile Association has instructed Chairman Jefferson DeMont Thompson to investigate the claims of St. Louis and Savannah has increased interest in the approaching event and decided the club to leave no stone unturned to secure the great international speed contest. Data are being collected to submit to Mr. Thompson in favor of the Georgia course, the first batch of information being obtained from the official in charge of the weather bureau, who shows from the records of the past thirty-six years that Savannah October weather is the best in the country. Other information being collected relates to accommodation, transportation facilities, etc.

Preparations for the March races are well advanced. The grandstands are almost completed, most of the curves have been banked and the course has been resurfaced wherever necessary. Provision has been made for warning signs along the road, thirty telephone stations have been provided for, and it has been decided to engage sixty flagmen, in addition to the military, for use during the two days of the races. The concession for a 64-page program has been awarded to J. Schreyer, of New York.

Entries are still being accepted for the Savannah meet on March 18 and 19, the controlling body having decided, in view of the intention of Ormond participants to stop at Savannah on their way North, to grant an extension to March 10. A number of manufacturers who for various reasons had been unable to put in an entry on the official closing date give assurance of cars being engaged.

For the 360-mile race open to stock chassis not exceeding 575 cubic inches piston displacement seven cars are now engaged. Michener will drive the Lozier, which ran in the Brighton Beach twenty-four hour race last summer; Harding and Poole will each have an Isotta-Fraschini; George Robertson and Herbert Lytle, of Vanderbilt Cup fame, will each pilot an Apperson Jackrabbit.

An Acme "sextuplet" runabout will be driven by Malcolm Newstetter, and an American runabout has been entered without nomination of driver.

For the 180-mile runabout race to be run on March 18, there are five entries, comprising two Thomas Detroit, to be driven by L. B. Lorrime and Oliver Light; an Apperson runabout, to be handled probably by George Robertson, and a Pennsylvania, to be driven by L. Zengel.

For the third event, now known as the Southern High Power Car Race, three cars are entered: Harry Levy's 120-horsepower Hotchkiss, a six-cylinder Stearns to be driven by F. W. Leyland, and a six-cylinder Thomas Flyer with G. S. Salzman at the wheel.

Looking East from the City Hall, Savannah, Ga., Showing River and Cotton Export Business Quarter.

BOOKS FOR AUTOMOBILISTS.

Touring Through England.—Merely because of its numerous excellent colored plates, Thos. D. Murphy's "British Highways and Byways from a Motor Car," published by L. C. Page & Company, Boston, is worthy a place on the book shelves of every automobilist. The author cannot be accepted as the only necessary guide for a tour through England—and indeed frankly states that he has no such pretension—for his journeys appear to have been a series of wanderings selected on the spur of the moment, often running over the same road twice and frequently leading through uninteresting industrial country where fairer routes were available. Nevertheless, the story of how Thomas D. Murphy piloted his Winton Model C through the highways and byways of Old England is sufficiently attractive to interest stay-at-homes, and his descriptions of scenes and customs in various parts of England cannot but be pronounced accurate by the traveler; even the apparent aimlessness of the travels is valuable because of the new scenes which are introduced.

Scotch Castles and Keeps.—There is such a wealth of romance and adventure in the land of the Scot that any literary effort on the castles of the north country has full possibilities of attractiveness. Frank Roy Fraprie, in his "Castles and Keeps of Scotland," has certainly lived up to his opportunity, the principal architectural monuments throughout the Lowlands and the Highlands being described in a way that makes the volume valuable as a companion and guide for a tour through this land. The mere mention that the book is published by Page & Company, of Boston, uniform with their well-known volumes on touring in France, is sufficient guarantee of the excellence of its illustrations and artisticness of its get-up. The addition of an outline map would doubtless have been appreciated by readers not fully acquainted with the geographical positions of the places described.

"The Gas Engine" Revised.—There are few better authorities on the internal combustion engine than Professor Frederick Remsen Hutton, of Columbia University, and engineers will be interested to learn that John Wiley & Sons, New York, have just brought out an enlarged and thoroughly revised edition of his well-known work, "The Gas Engine." Professor Hutton has made a most exhaustive study of the internal combustion motor of every type, extending over a long period of years, so that his work is the result of practical experience that has been contemporaneous with the development of the gas engine in commercial use. Every possible phase of the subject is dealt with and expounded at length and one of the features of the book that will make it invaluable to automobile engineers as a reference work, is the great mass of authentic data that it contains. It is a volume of close to 600 pages and within its covers will be found the entire history and development of the internal combustion from its very inception, written in a practical and concise manner. It lists at \$5.

AERO CLUB OF AMERICA SEEKS AERODROME.

In a short time it is expected that the members of the Aero Club of America will have an aeronautical ground on which they may make experimental flights in the neighborhood of New York City with a reasonable amount of privacy and seclusion. Arrangements are now in the hands of the Board of Directors for securing such a ground where members may test their models with security to themselves and no danger to the property of others. A reasonable guarantee will be required from those who are testing their machines in order to safeguard public property.

A few places yet remain at the annual banquet of the club at the Hotel St. Regis, March 14. Members are at liberty to invite guests and the tables will be arranged each to accommodate parties of eight persons.

LONG ISLAND TEST PROVES AUTOMOBILE ECONOMY

AIR-COOLERS won the honors in the mid-winter economy test of the Long Island Automobile Club, February 25. Harry H. Knepper's 24-horse-power Frayer-Miller was found by the gasoline and fuel committee to have transported its passengers from the Brooklyn clubhouse to Montauk Point and return at the lowest cost per head, and was awarded the first prize. The Franklin, handled by H. A. Vail, used less gasoline than any car on the run, but as it carried only four passengers the cost per head worked out higher than for the Frayer-Miller, and the air-cooler from Syracuse had to take second position. R. Morton brought the four-cylinder Pullman home in third position and had the honor of driving the most economical of the water-cooled cars. The two-cylinder Maxwell, though not a prize winner, ran the leaders very close, and was just as hard pressed by the four-cylinder Pope-Hartford, which lost on oil what it gained in gasoline.

The most noteworthy feature of the 234-mile mid-winter run was the extreme economy displayed by the greater part of the nineteen cars qualifying within the time limit. The winning Frayer-Miller, with five persons on board, had a total cost for fuel and lubricating oil of but \$3.56, or 71 1-5 cents per head. The Franklin's cost was the lowest of the competition, totaling only \$3.10; as this sum had to be divided by four, the cost worked out at 77 1-2 cents per head. Ten out of the nineteen cars accomplished the run at a per capita cost of less than one dollar, and eight others kept the cost below two dollars. Calculations were based on gasoline at 25 cents per gallon and lubricating oil at \$1 per gallon.

Among the seven-passenger cars the best performance was made by H. A. Martin's American Mors, with a cost of only 92 cents per passenger; the economy is the more remarkable in view of the fact that the Mors was a closed limousine with wind shield and all accessories for winter touring. Of the six-cylinder contestants, C. A. Carlson's Winton was the most economical,

Frayer-Miller, Franklin and Pullman, Winning Trio.

HOW THE CARS FARED ON FUEL BASIS.

Two hundred and thirty-four miles had to be covered by the contestants within a time limit of eighteen hours. There was no penalization of any kind. Oil and gasoline were supplied in sealed, measured cans, and controlled throughout by official observers. Cost of fuel per head formed the basis of awards. Twenty-three cars started and nineteen qualified by covering the distance in the time limit imposed.

Car	Gasoline gals.	Oil quarts	Total cost	Passengers	Per capita cost
Frayer-Miller	13.000	1 1-4	\$3.56	5	\$0.71 1-5
Franklin	9.875	2 1-2	3.10	4	77 1-2

*Two-cylinder car. †Six-cylinder car. ‡Limousine.

with a per capita cost of 97 3-7 cents per head. The oil consumption was remarkably low, being but seven-eighths of a quart for 234 miles. J. D. Rourk's Cadillac, the only single-cylinder machine in the run, was debarred from a better position owing to the collapse of a wheel and trouble on the road which caused a greater consumption of fuel than usual. Thirteen of the nineteen successful cars, including the Franklin, were equipped with Diamond tires, all of which completed the run without a single case of puncture or blow-out.

In credit to some of the powerful, speedy cars, it should be pointed out that there were no class divisions whatever, single-cylinder and large six-cylinder touring cars competing on a common basis. This naturally placed the speedy runabout and tour-about class at a disadvantage, a fact which should be borne in mind in examining the table of performances. The deficiencies of the test were realized by the club committee, who sought more to prove the economy of the automobile as a pleasurable means of transportation than to test the all round efficiency of the machines engaged.

Though not a complete comparison, it is still interesting to note the difference in cost between automobile and railroad travel, as exemplified in this run. The journey to Montauk Point and return by rail costs \$5.28 each; thus the five passengers on the winning car would have handed over \$26.40 for their trip, instead of \$3.56. Between 70 and 80 cents, the individual cost on the first half dozen cars, and the railroad charge of \$5.28 there is a difference which, though not surprising to the automobilist, will probably astonish the general public. Even the speedy high-powered runabout, with a rate of travel equaling that of an express train, keeps its fuel cost less than half that of the railroad fares.

Obviously, the cost charge is not complete, for there is no allowance for tires, maintenance, and depreciation; adding a substantial percentage for this, however, the automobile still stands out as remarkably efficient on the economic basis.

FEDERAL AID IN ROAD BUILDING PROBABLE.

When such a far-reaching and powerful organization as the National Grange assumes the aggressive in advocating that the Federal Government should aid the States in the building of roads, then it would seem that the day is near at hand when the construction of highways is to begin in earnest throughout the entire country.

"No argument can be advanced in favor of the annual appropriations by Congress on behalf of river and harbor improvements that does not apply even more strongly to the improvement of our public roads," contends the Grange—one million strong—in resolutions unanimously adopted. Continues the resolving: "We favor the immediate enactment of legislation by Congress making liberal Federal appropriations for the improvement of the public highways of the country, these appropriations to be expended in such manner as Congress may prescribe."

Of course, all automobilists will help the Grange in its efforts to secure Federal aid in this vital building of the roads, and here again comes into play the spreading national growth of the American Automobile Association, the Good Roads Board of which, under the chairmanship of the energetic Hooper, is accomplishing much more than would appear to be the case on the surface. Those who sit in our legislative halls at Washington are becoming aware that automobilists are watchful of measures which concern them, and this keenness of sight will continue until the desired things become realities.

Once upon a time when the cyclists—a hundred thousand strong—talked and argued for good roads from

dawn to darkness, some attention was paid to their words, but not enough heed was given to accomplish anything very tangible. The persistent efforts were not wasted entirely, but the man who lives in the country is never as quickly convinced as is the urban dweller, and in this building of the roads the farmer pays his share of the cost only through the results of toil with profits won from the soil by the sweat of his brow. Economy is to him a necessity which teaches the value of every dollar expended, and, though he soon realized the advantages of roads deserving the name, the cost staggered him when the burden seemed to fall heaviest in his direction. But with the coming of substantial State aid he gladly came forward with his share of the money, and while progress in many States has been meager and tedious, the knowledge gained in the work of education is the basis for that unanimous support which is going to "House Bill No. 15,837."

Once National roads are built there must come National supervision in their maintenance, for that has been the experience in those European countries where roads building is rated a science of great worth to the welfare of the nation. We shall quote from a letter that has just come to hand from one of our regular contributors, Francis Miltoun, who is an American with a temporary residence in France, and who has just returned from a tour in Tunis and Algeria. Mr. Miltoun is a student of roads, and this is what he says on the care of National highways after they are built:

"The point I make is that Tunisia, only a quarter of a century old as a civilized country, and Algeria, barely three-quarters of a century old, can make good roads and keep them up efficiently. So can we, but they must be National roads, under National supervision. That's my slogan. Did you know that the famous Bath road in England is under the control of sixteen different authorities—from London to Bath—that is why it is good in parts and bad in parts. The Route d'Antibes, from Paris practically to the Italian frontier, is under one administrative control, and that is why it is a good road all the way along. It is this same central control that one finds in Algeria and Tunisia."

TECHNICAL TRAINING FOR REPAIRMEN.

To say the least, it is unfortunate that more of the men who hang out their shingles to invite the passing autoist who may be in trouble, to cure the ills of his car at their establishments, should not have had the benefit of a prior technical training before embarking in the lucrative practice of learning how to repair automobiles at their owners' expense, not to mention the damage done to the machine itself. It would be far from just to accuse repairmen, as a body, of ignorance, but the number of cases in which the charge is justified is lamentable, as their efforts tend to discredit their better equipped confreres and their misguided tinkering not only fosters the delusion that the automobile is a mechanical mystery, but adds enormously to the annual cost of maintaining a car. Their influence in this direction proves detrimental to the sport of automobiling and many a good car has been utterly condemned by its owner on the prejudiced opinion of an incompetent repairman. A little training would indeed be a most valuable asset.

A. A. A. NATIONAL CONVENTION AT BUFFALO, JULY 6-7

DECISION to hold a National Convention at Buffalo immediately preceding the start of the Annual Tour, the appointment of a European touring representative, election to membership of the West Virginia State Automobile Association and the Automobile Club of Vermont, attention to the legal situation, and discussion of a campaign for increased individual membership was the well-filled program of the directors' meeting of the American Automobile Association, at New York, Tuesday, March 3.

Buffalo will be the scene of a National Convention of the A. A. A. July 6 and 7, the subjects to be discussed being good roads, touring and legislation. As the Fifth Annual A. A. A. Tour will start from Buffalo on July 8, the first convention will certainly be the means of uniting large numbers of automobilists from all parts of the country.

Five State associations have been elected to the A. A. A. since the annual meeting in November, making a total of twenty-one associations now affiliated. Organization work having been completed in Virginia and Kentucky, those States will probably apply for membership at the next meeting.

Chairman Hower announced that he had made arrangements with Victor Breyer, of Paris, France, to become European touring consul for the association for the year 1908. Mr. Breyer, who is well known as the manager of the 1907

Grand Prix, will give free information on touring to all A. A. A. members abroad, assist them to hire cars, engage chauffeurs, and furnish all necessary help in touring abroad.

Chairman Terry, on behalf of the Legislative Committee, asked for the co-operation of State associations and clubs in securing a large delegation on the occasion of the hearing of the Federal Registration Bill before the Judiciary Committee of the House of Representatives, at Washington, March 12. Chairman Terry and his associates are confident of the unanimous approval of the bill by the Judiciary Committee and Congress, and its passage within a few weeks. Among the detail matters discussed was one for an increase of individual members in all States, whether a State association existed or not.

The meeting, which was presided over by President Hotchkiss, was attended by Chairmen Thompson, Hower and Hooper, of the Racing, Touring and Good Roads Boards, the following directors: Lewis R. Speare, Boston; Edward Kneeland, Pittsburg; S. L. Haynes, Springfield; Paul C. Wolff, Pittsburg; Isaac Starr, Jr., Philadelphia; George A. Post, Paterson, N. J.; John P. Coghlin, Worcester, Mass.; Giles H. Stilwell, Syracuse, N. Y.; Treasurer Farrington, and Secretary Elliott. The Pittsburg Automobile Club extended an invitation to hold the next meeting in that city.

TO ATTACK JERSEY LAW IN COURTS.

NEWARK, N. J., March 3.—New Jersey automobilists have abandoned all efforts to obtain a moderation of the proposed Frelinghuysen amendments to the present automobile law and will attack the constitutionality of the latter in the courts on the ground that it is double taxation. In an interview with a representative of the Newark *Call*, Joseph H. Wood, former president of the New Jersey Automobile and Motor Club, said: "Motorists have come to realize that the automobile law question can never be settled satisfactorily until it is settled on fundamentally just principles. For the recognition of these principles we will now fight and there will be no quarter given. The era of compromise is over, so far as Jersey automobilists are concerned."

The New Jersey Automobile Trade Association held an animated meeting at the automobile show at Electric Park on Saturday last to discuss the matter, and a resolution attacking the act was unanimously indorsed. This states that all conferences with the State authorities on the subject are at an end, and in it the association goes on record as being "unqualifiedly and unalterably opposed to the high, prohibitive and inequitable license fees proposed."

H. A. Bonnell, secretary of the New Jersey Automobile and Motor Club, sent out notices yesterday calling a special meeting for Friday for the purpose of discussing the present law and the proposed amendments thereto. The meeting has been called at the request of W. C. Crosby, chairman of the legislative committee, so that the law may be discussed at length and thoroughly understood. A smoker will be held in connection with the meeting.

PRIVATE RACER FOR VANDERBILT CONTEST.

Though all details are at present withheld, Raymond Healy declares that he has just had constructed in this city a powerful racing car intended for the Vanderbilt Cup race and for demonstrating the endurance of an automobile tire in which the owner is interested. The car is declared to develop 90 horsepower and to have shown a speed of 95 miles an hour. Krupp steel has been employed in its construction to a considerable extent, and total weight is said to be under 1,800 pounds. The gasoline tank has a capacity of 25 gallons.

ILLUMINATED PARADE FOR AUTO CARNIVAL.

New York will be a busy automobile center during the week beginning April 6, the six days on which the New York Automobile Trade Association intends to hold carnival in celebration of the tenth anniversary of the introduction of the automobile to the city, and incidentally to foster Spring buying in the metropolitan district.

Arrangements, which are now well in hand, provide for an interesting illuminated parade on the evening of Tuesday, April 7. There will be four sections, devoted respectively to old cars, modern vehicles, private decorated automobiles and commercial cars. In the retrospective section old cars of 1903 or earlier will show in panoramic form the evolution of the automobile from the earliest days. A part of this section will be taken up by racing cars having figured in the more important speed contests of the past. The modern section will comprise the best models of the day.

On Thursday, April 9, there will be a hill climb in some spot near the city, the exact location of which has not yet been decided upon. On Friday, April 10, there will be a daylight parade and a short run to some club or resort, where luncheon will be served. It is the intention of the New York Automobile Trade Association and those independent dealers who have promised their co-operation in the scheme, to keep "open house" during the entire week. Special features will be installed at all the showrooms and each firm will hold a private exhibition.

WHAT THE LAWMAKERS ARE DOING AT ALBANY.

ALBANY, March 3.—The Fowler bill, which would require automobilists to pay a tax of 50 cents per 100 pounds, in addition to their registration fee, was held over by the taxation committee at a hearing to-day, Assemblyman Fowler admitting that there were features which should be changed. The hearing of the Wainwright bill to compel all vehicles using the highways to carry lights at night was put over until March 10. President O. A. Quayle, Attorney M. T. Bender and others of the state automobile association are in conference with a number of the Senators and Assemblymen over the provisions of the proposed bill to revise the present automobile law.

A. A. A. ANNOUNCES LEGISLATIVE AND TOURING BOARDS

At the last meeting of the Executive Committee of the American Automobile Association, the members appointed to the Legislative Board for the present year were announced. Charles T. Terry, New York, continues as chairman, and this year he will be supported by a much larger board than previously in order that effective work may be done in connection with the passage of the Federal registration bill now pending in Congress. The board is largely composed of representative lawyers who are interested in securing such legislation as will put an end to the confusion and injustice resulting from the working of the present State laws. The Legislative Board is composed of the following:

CALIFORNIA.
G. Allen Hancock, Los Angeles.

COLORADO.
W. H. Bergtold, Denver.

CONNECTICUT.
Walter S. Schutz, Hartford.
James E. Cooper, New Britain.

DELAWARE.
John Bancroft, Wilmington.
Samuel J. Wright, Newark.

DISTRICT OF COLUMBIA.
Robert B. Caverly, Washington.

FLORIDA.
J. B. Parkinson, Daytona.

GEORGIA.
R. J. Davant, Savannah.
M. Felton Hatcher, Macon.

ILLINOIS.
Sidney S. Gorham, Chicago.
George W. Ehrhart, Decatur.
John Farson, Chicago.
William K. Bracken, Bloomington.

INDIANA.
Samuel P. Irwin, Bloomington.
R. N. Baker, Springfield.

INDIANA.
Fred. M. Ayers, Indianapolis.
Samuel Murdock, LaFayette.
Edgar Apperson, Kokomo.

IOWA.
Dick R. Lane, Davenport.

KENTUCKY.
George H. Wilson, Louisville.

LOUISIANA.
William McL. Fayssoux, New Orleans.

MAINE.
Fred. J. Allen, Sanford.
Frederick Hale, Portland.
Charles T. Libbey, Portland.

MARYLAND.
William C. Devecmon, Cumberland.
Osborne I. Yellott, Baltimore.
Robert H. Carr, Jr., Baltimore.

MASSACHUSETTS.
Francis A. Hurtubis, Jr., Boston.
Samuel L. Powers, Boston.
Robert C. Cooley, Springfield.
W. H. Chase, Leominster.
D. F. Gay, Worcester.

MICHIGAN.
D. M. Ferry, Jr., Detroit.
Fred E. Rowe, Grand Rapids.

MINNESOTA.
F. B. Nelson, Minneapolis.
Lou S. Gillette, Minneapolis.
F. B. Lynch, St. Paul.

Make-up of the A. A. A. Touring Board for 1908.

The appointments to the Touring Board were also gazetted at the same time. Members appointed to the Touring Board are, with few exceptions, secretaries of their clubs. This has been done in the expectation that their chief function during the present year will be to keep the headquarters of the Touring Board informed as to the condition of roads, the existence of speed traps and concerning local customs in the matter of the enforcement of the law in their various neighborhoods. Such members of the committee as are in the route of the Glidden tour will also be expected to coop-

erate with the chairman and secretary both before and during the tour. There will be no executive committee of the Touring Board this year. The personnel of the board is as follows:

Frank B. Hower, chairman, Buffalo, N. Y.
Dai H. Lewis, secretary, Buffalo, N. Y.

CALIFORNIA.
Charles B. Hopper, Los Angeles.
E. C. Hickman, San Diego.

COLORADO.
Frank I. Ewing, Greeley.

CONNECTICUT.
F. T. Staples, Bridgeport.
G. K. Dustin, Hartford.
W. L. Hatch, New Britain.
G. H. Townsend, New Haven.

DISTRICT OF COLUMBIA.
LeRoy Mark, Washington.

FLORIDA.
Herbert P. Race, Jacksonville.
T. E. Fitzgerald, Daytona.

GEORGIA.
Arthur W. Solomon, Savannah.
H. J. Lamar, Jr., Macon.

ILLINOIS.
Joseph F. Gunther, Chicago.
George G. Greenburg, Chicago.
R. A. Whitney, Peoria.
R. N. Baker, Springfield.

INDIANA.
Fred M. Taft, Logansport.
H. A. Brown, Indianapolis.
Horace E. Kizer, South Bend.

IOWA.
A. H. Ruebsam, Davenport.

KENTUCKY.
Charles Chrestle, Louisville.

MARYLAND.
D. A. Clark, Baltimore.
Charles M. Danzer, Hagerstown.

MASSACHUSETTS.
F. P. Strout, Springfield.
J. C. Kerrison, Boston.
Edward S. Bryant, Brockton.
F. L. D. Rust, Boston.
F. E. Frost, Worcester.

MICHIGAN.
Paul H. Deming, Detroit.
J. R. Jackson, Grand Rapids.
Edwin S. George, Detroit.
C. A. Flood, Hart.
Charles Haines, Cadillac.
J. C. Hatfield, Kalamazoo.

MINNESOTA.
W. W. Walker, Duluth.
George H. Daggett, Minneapolis.
H. S. Johnson, St. Paul.

MISSOURI.
W. P. Stevens, Kansas City.
S. D. Capen, St. Louis.
M. T. Slane, St. Louis.

NEW JERSEY.
James B. Dill, East Orange.
R. N. Johnston, Atlantic City.
J. Hiscok, Cape May.
W. F. Sadler, Trenton.
George W. Pittenger, Asbury Park.

NEW YORK.
Oliver A. Quayle, Albany.
G. W. Bowen, Auburn.
D. H. Lewis, Buffalo.
C. H. Benedict, Schenectady.
Forman Wilkinson, Syracuse.
Robert M. Hunt, Utica.
S. M. Frechie, Binghamton.
F. R. Richardson, Elmira.
C. W. Fairfax, Geneva.
Otis W. Sherman, Poughkeepsie.
Russell A. Field, Brooklyn.
N. L. Bates, Oswego.
J. J. Worrell, New Brighton, S. L.
B. Van Tuyle, Rochester.
I. G. DeCant, Watertown.
A. B. Barkman, Tarrytown.

OHIO.
F. W. Work, Akron.
Harry D. Crane, Cincinnati.
Charles J. Forbes, Jr., Cleveland.

PENNSYLVANIA.
Stedman Bent, Philadelphia.
Phillip S. Flinn, Pittsburg.
W. O. Davis, Erie.

TEXAS.
Eugene Corley, Dallas.
C. J. Overman, San Antonio.
S. E. Bering, Houston.

VERMONT.
W. W. Brown, Springfield, Vt.
C. C. Warren, Waterbury.
Charles A. Matthews, Rutland.

VIRGINIA.
Otis M. Alfriend, Richmond.
Frederick Lewis, Norfolk.

WEST VIRGINIA.
T. J. Westmyer, Wheeling.
X. Poole, Martinsburg.

WISCONSIN.
Dr. Louis Fuldner, Milwaukee.

The Publications Board and Its Constituents.

Coincident with the announcement of the appointment of the Legislative and Touring Boards, the following were named as members of the Publications Board for the ensuing year:

A. G. Batchelder, chairman, New York City.
John C. Kerrison, Boston, Mass.
Russell A. Field, Brooklyn, N. Y.
John C. Wetmore, New York City.
T. B. Creamer, Philadelphia.
W. F. Thomas, Newark, N. J.
Arthur N. Jervis, New York City.
W. S. Gilbert, Cleveland, O.
C. F. Fitzgerald, Daytona, Fla.
L. C. Boardman, Chicago.
L. P. Baekey, Philadelphia.
G. A. Wahlgreen, Denver, Col.
R. R. L'Homedieu, San Francisco.

AERO GORDON-BENNETT STARTS OCTOBER 11.

BERLIN, Feb. 27.—The date of the Aero Gordon-Bennett has now been definitely fixed upon for October 11. This is a Sunday. On the day preceding, Saturday, two other races will take place, open only to members of the German Airship Association, which has the arrangement of the chief event.

ORMOND-DAYTONA RACES IN FULL SWING

By JOHN C. WETMORE

ORMOND, FLA., March 1.—Though the past glories of the Ormond-Daytona beach meets so far as big fields and multitudes of spectators will not be received this year at the present writing at noon on Sunday, indications point to a limited but high class array of starters with a probable minimum of six in each of the four long-distance races carded for the week. At least the Automobile Club of America can claim the credit of not letting the annual tournament go by the boards, and by hard hustling having gathered a sextette of racers likely to put up on the smooth beach new records for all distances of 100 miles and over.

The array of fast ones already on hand is noteworthy. Walter Christie has his Big Bear, with a 35-second mile record on Atlantic City beach; and the 60-horsepower Christie he drove in the last Vanderbilt Cup race. E. B. Blakeley will pilot the former and Christie himself will drive the latter. Emanuel Cedrino is here with the Fiat Cyclone, built on Grand Prix lines, and Maurice Bernin with a new 60-horsepower Renault Frères.

A new racing enthusiast, R. W. Buckley, of Brooklyn, shies his caster into the arena at this meet. He bought the 120-horsepower B. L. M., completed too late for the last Vanderbilt Cup trials, and will drive it in the big race and the invitation contest. He will also enter and drive his 70-horsepower Thomas runabout in the stock car race. The 120-horsepower Vanderbilt Hotchkiss, to be driven by F. B. Shaft, is en route, as is also a 60-horsepower Haynes, to be piloted by R. G. Kelsey. The former is nominated by Harry Levey, of New York, the cleansing magnate. This about completes the list of probable starters or those likely

to figure prominently in the big race. Other candidates for stock car, Minneapolis Cup, and invitation race honors are a 60-horsepower Benz, entered by Louis Bergdol, of Philadelphia, which G. P. Parker will pilot; James Loughlin, 3rd's 30-horsepower Cleveland; Joseph W. Gilbert's 30-horsepower Packard, and a Franklin, entered by Mr. Stimson, of Jacksonville.

Ormond never put up a balmier line of weather than the present; but—alas!—the condition of the beach is most disappointing. Between Ormond and Daytona there are so many soft spots of red sand that it is probable that none of the races, except perhaps the stock car contest, will be run over this end of the beach. South of Daytona, however, the beach is fairly good and likely to admit of new long-distance records by the very fast bunch of contenders at hand. It is likely that a 12 1-2-mile stretch will be laid out and the races run in 25-mile circuits of 300, 150 and 100 miles.

The races will be conducted by Chairman Robert Lee Morrell, A. L. Riker, A. R. Whiting and S. B. Stevens; all but the latter are already here. They will be assisted by F. J. Wagner, as starter; George L. Weiss and Lieut. P. A. Sayles, as timers; and Secretary S. A. Butler, as indispensable man of all work.

Among the other racing enthusiasts here for the meet are: Mr. and Mrs. Joseph M. Gilbert, Mrs. A. L. Riker, Mrs. Buckley, Mr. and Mrs. A. W. Church, E. R. Hollander, N. Lazardnick, W. A. Adriance, E. A. Percy, E. C. J. McShane, Harlan W. Whipple, A. R. Hawley, R. A. Field, Mr. and Mrs. W. H. Harrison, F. Ed. Spooner, and W. A. Rutz. The hotel is crowded with a big overflow in the cottages in the grove.

FEW STARTERS IN OPENING DAYS' EVENTS

ORMOND, FLA., March 3.—No record was broken when Emanuel Cedrino, in the Fiat *Cyclone*, captured the Minneapolis Cup on the opening day of the sixth annual speed carnival. The light track racer recently imported from Italy covered the hundred miles in 1:50:20, running the last sixty miles on three tires and a rim. The record made in 1906 by Clifford Earp on a Napier is 34:40 better.

To the disappointment of the large crowd of spectators, but three cars lined up for the start of the 100-mile race: Blakely, on W. Gould Brokaw's 130-horsepower front drive Christie; Shefts, in Harry Levey's 120-horsepower Hotchkiss; and Cedrino in the Fiat. The start was made at the twelve-mile post in front of the clubhouse at Daytona, and was run over a twelve and a half-mile stretch.

The Hotchkiss got away first, but was soon passed by the Fiat, and before the French car had gone a mile its chances had been lost by a long delay caused by clutch trouble. The Christie had difficulty with its automatic inlet valves, after covering ten miles, and ceased to figure in the contest. The Fiat lost time through a front tire pulling off the rim on two different occasions, the mishap allowing the Hotchkiss to creep up to within five miles of the Italian. At the 50-mile mark, however, the Fiat had a substantial lead, its time being 64:05, compared with 1:17:51 for the Hotchkiss. The French car later withdrew, leaving the Italian alone for an uninteresting finish. The Fiat carried off the special prize of \$100 offered by the Continental Caoutchouc Company for the fastest car fitted with their tires and racing rims.

Though faster time was made by the German Benz, winner of the 150-mile stock chassis race, the afternoon event was

no more interesting than that of the morning. Louis J. Bergdol, on the 80-horsepower Benz, covered the first 25 miles in 25:15, being then ahead of the morning time; the 50-mile mark was passed at 61:02; 125 miles at 2:10:38, and the winning post at 2:40:53.

The four starters were W. Gould Brokaw's Allen-Kingston, James Laughlin's Cleveland, a Thomas Flyer, driven by J. Carey, and L. J. Bergdol's Benz. The only withdrawal was the Haynes, which had previously broken its crankshaft. A good start gave the Benz a lead, which it easily maintained to the end. At the twenty-five-mile mark the Thomas was second and the Cleveland third. The Allen-Kingston retired early with burned-out bearings. Summary for first day:

100-Mile Race for Minneapolis Cup.—Won by Cedrino, 80-horsepower Fiat "Cyclone"; time, 25 miles, 26:39 4-5; 50 miles, 60:05; 75 miles, 85:06; finish, 1:50:20.

150-Mile Stock Chassis Race.—Won by Bergdol, 80-horsepower Benz; time, 25 miles, 25:15; 50 miles, 61:02; 75 miles, 85:32; 100 miles, 1:47:31; 125 miles, 2:10:38; finish, 2:40:53.

Benz Victory Feature of Second Day's Racing.

ORMOND, FLA., March 4.—Over a vastly improved beach, Louis J. Bergdol, driving an 80-horsepower Benz, to-day won the 125-mile invitation amateur race in 1:53:30 2-5, cutting his new record figure of yesterday. S. B. Stevens, in the Fiat *Cyclone*, was second, covering 95 miles in 1:54:28, after losing 29 minutes waiting at Daytona for a new rocker arm to be brought from Ormond. Stevens led with 41:37 for 50 miles and 50:18 for 70 miles, at which point he was four miles ahead of the German car. R. G. Kelsey, who was third, was last timed at 50 miles in 1:05:46. The race was run over a 50-mile course at the Daytona end of the beach.

Escorting Italian Through Snowdrifts Into Chicago.

WORLD TOURISTS PROTEST AND SQUABBLE.

Dissensions have arisen among the group of men trying to cover the 20,000 miles between New York and Paris by automobile. The two foreigners forming the rear guard complain that they are being badly treated along the road, and the crews of the two leading cars have put in a protest against the only American, declaring that it was rebuilt at Buffalo and had received help in the run through snowbound Indiana. Thomas emphatically denies the charges.

The crew of the De Dion car, *Le Matin's* official automobile, have quarreled among themselves. Captain Hansen, a Norwegian explorer selected by the De Dion Company to pilot the car, was unable to agree with Saint-Chaffray, the *Matin* delegate, and quit at Chicago. The rupture is not surprising, for at the start in New York there was little harmony between the *Matin* official and the drivers of the French cars.

Captain Hansen has now made arrangements with the E. R. Thomas Company to take their car through to Paris. He will probably join the car when it reaches Cheyenne, Wyo., at which spot Roberts will turn it over to some other driver. It had at first been intended to send the Thomas car as far as San Francisco only; now, however, that Hansen has been secured, it will be sent by train from Cheyenne to Seattle on March 5, in company with the foreigners, its equipment completed, and driven through Alaska and Siberia to Paris. The prospects of the American car reaching Paris have been enormously increased by this move, for Captain Hansen is the only man who has had actual experience in Arctic regions, and was selected by the De Dion Company as the most capable man Europe could provide.

How the De Dion Team Looked on Reaching Chicago.

Thomas, De Dion and Zust have left Chicago and are now on the second leg of the journey, struggling with Iowa mud. The Thomas is leading, the De Dion and Zust keeping as close together as possible over one hundred miles in the rear. The German Protos and French Motobloc have also formed an alliance, and will probably set out from Chicago together after a brief rest and overhauling of their machines. It is not likely, however, that they will continue far, for, according to an agreement, all cars must be put on the railroad on March 5 in order to arrive at Seattle in time to catch the last boat to Valdez, Alaska. Many who are familiar with conditions in the Northern regions believe that even with this saving of time it will be impossible to get through Alaska before the thaw transforms the country into a huge bog and makes travel impossible. It is to avoid such a hold-up that the cars are to be rushed ahead on the railroad instead of continuing across country under their own power.

The mileage of the different cars from the thirteenth day to date is as follows:

Car	Country	14th Day	15th Day	16th Day	17th Day	18th Day	19th Day	20th Day	21st Day
Thomas	(America)	1043	1043	1043	1118	1227	1297	1395	1502
De Dion	(France)	987	1043	1043	1043	1117	1212	1263	1363
Zust	(Italy)	987	1043	1043	1043	1117	1212	1263	1363
Protos	(Germany)	912	932	949	963	981	993	993	993
Motobloc	(France)	895	921	949	963	981	985	993	1043

Not Snowbound—Only Rushing Studebaker Through to Kansas.

STUDEBAKER ACCOMPLISHES WAR MISSION.

Starting out from New York six days after the New York-Paris tourists, the Studebaker army car passed the leaders in the round-the-world run before Chicago and presented its dispatch to the Governor of Fort Leavenworth, Kansas, Tuesday, March 3. The 1,500-mile run which had been undertaken to prove the value of the automobile as a factor in military operations, was beset with enormous difficulties owing to the wretched condition of the roads and the heavy snowdrifts encountered for a considerable portion of the distance. Relays of drivers were employed, the men being sent ahead by train to await the car's arrival; in this way the machine was kept running twenty-four hours a day.

Studebaker-Pullman Run to Savannah.

PHILADELPHIA, March 3.—With Robert Morton and Frank Yeager at the wheels, a Pullman and a Studebaker left this city this morning for an endurance run to Savannah, Ga., on a wager of \$1,000, which will be awarded to the driver first reporting to the Savannah Motor Club. The run is being held under the auspices of the Quaker City Motor Club, Dr. J. E. Overeck and G. W. Daley being the official observers. The route is via Reading, Harrisburg, Gettysburg, Washington, Richmond, Portsmouth, Danville and Columbia.

MARCH DOINGS OF THE AUTOMOBILE CLUBS

BANQUET OF THE A. C. OF PHILADELPHIA.

PHILADELPHIA, March 2.—Upwards of one hundred members and guests gathered in the huge banquet hall of the Manufacturers' Club last Friday evening on the occasion of the annual dinner of the Automobile Club of Philadelphia. Many out-of-town guests of prominence were present, and the tenor of the addresses was so hopeful for better things for the automobilists that all hands voted the symposium the most successful and enthusiastic ever held under the club's auspices.

The various elements now quietly at work for the improvement of the roads between Washington and New York—all had representatives present, and the reports of the work already accomplished were evidently gratifying to those assembled about the board.

Robert P. Hooper, chairman of the Good Roads Board of the A. A. A. and vice-president of the Pennsylvania Motor Federation, urged the concentration of all local clubs and individual automobilists upon the matters of good roads, better laws and signboards. He urged all automobilists to prod their representatives at Washington to do all in their power to aid the passage of the Federal Registration bill, now pending in Congress, and upon which a hearing will be given next week.

In the unavoidable absence of Mayor Reyburn, his Director of Public Safety, Henry Clay, was on hand to say a word of welcome to the visitors and outline the city's attitude toward automobilists.

Colgate Hoyt, president of the Automobile Club of America, spoke of the great advance in automobile construction, and instanced the recent Long Island economy test, where the winning car carried its passengers over 242 miles of road at a cost per head for fuel and oil of but 71 1-2 cents, whereas a round trip railroad ticket costs \$5.38.

In the capacity of toastmaster, Secretary S. Boyer Davis made many hits. He thought the Automobile Club of Philadelphia deserved credit for its good roads and signboard work and its membership of over 525, and predicted twelve months hence a total on the rolls which would make a membership of one thousand a possibility before the completion of the following year.

MARYLAND OFFERS AUTO CORPS TO ARMY.

BALTIMORE, Md., March 5.—Developing the original idea of the Quaker City Automobile Club to endow the nation with Volunteer Motor Corps as part of the militia, the Automobile Club of Maryland has forwarded resolutions to the President of the United States, Congress and the General Assembly of Maryland.

The value of the automobile as an auxiliary in military operations having already been fully demonstrated, the Maryland club recommends to the Congress of the United States that it provide by appropriate act or acts of Congress for the organization, arming, and disciplining of Volunteer Motor Corps as part of the regularly organized militia of the several States. The club offers to both Federal and State governments the service of so many of its members and their automobiles as may be necessary for the organization of a Volunteer Motor Corps in the home State in the event of the adoption of the resolution.

In case the recommendation is not adopted, and the proposed corps is precluded from becoming a branch of the State militia, the club offers to form a volunteer corps and place it at the services of the city of Baltimore and the United States government in all cases of need or necessity.

TOLEDO CLUB TAKES AN ACTIVE ROLE.

TOLEDO, O., Feb. 10.—While Ohio is one of the later States to develop an active participation in the good roads movement, much work has been accomplished there within the past year. The most recent addition to the good roads army in the Buckeye State is the newly-organized Automobile Club of Toledo, which has leased quarters in the new Hotel Secor, and has gone at its work in an aggressive manner, plainly indicating that it will be a potent factor.

The club is made up of men who are identified with the various professional and business interests of the city, and an important factor in the promise of success that this club shows can be found in the officers elected to guide affairs.

E. D. Libbey, the president, is well-known as a manufacturer of cut glass, and also as the exploiter of bottle-blowing machinery that has revolutionized that industry. He is an intensely enthusiastic autoist and every summer tours through Europe. He is prominently identified with the social,

E. D. Libbey, President. E. J. Marshall, Vice-President. A. L. Spitzer, Secretary. J. M. Steenberg, Treasurer.

business, and club life of Toledo, and among his many interests is that of president of the Toledo Museum of Art. E. J. Marshall, the vice-president, is a prominent corporation lawyer, identified with the automobile industry, and is himself an enthusiastic automobilist. A. L. Spitzer, the secretary, is a member of Spitzer & Company, bankers, of Toledo and New York, and has been a good roads advocate for years. J. M. Steenberg, treasurer, has been foremost among local autoing devotees ever since the rise of the sport.

These men, with John J. Manning, Marshall Sheppey, W. W. Morrison, John N. Mockett, and F. M. Brigham, constitute the board of governors. The club anticipates building an up-river clubhouse and already steps have been taken to put the roads around the Maumee and Perrysburg belt drive in perfect condition for automobiling.

TWO ACTIVE VIRGINIA AUTOMOBILE CLUBS.

RICHMOND, Va., March 2.—The Richmond Automobile Club was organized in October and has about seventy members. There are about 200 autos owned in Richmond. The officers of the club are: President, Dr. R. Angus Nichols; vice-president, John B. Swartwout; secretary-treasurer, Otis M. Alfriend. The club hopes to join the A. A. A. in the near future. At present they are working to secure the passage of a bill before the Legislature, which will give State aid in roads building. The club also plans to have some local races and endurance runs.

There are a number of accessible places within a radius of twenty miles of Richmond, but no extended trips can be made with comfort because of the poor highways.

The Valley Motor Club, of Virginia, has headquarters at Staunton, Va. The officers are: President, M. C. Watts; vice-president, C. S. Hunter; secretary, E. R. Armentrant; treasurer, Frank T. Holt.

Governor Hughes Utilizes the Premier.

New York's governor appreciates the value of the automobile as a means of keeping numerous engagements in an evening, and is shown here on the occasion of a lecture trip in the metropolis.

SUCCESS OF ROCHESTER AUTO SHOW ASSURED.

ROCHESTER, N. Y., March 2.—Every space is taken for the first annual Rochester automobile show to be held March 18-21 inclusive. Owing to the large number of applications for space since the last were sold the management is making arrangements for additional space, which will be in the foyer and basement. Every inch of space on the main floor is taken up with automobiles, while the large platform built for the accessories in the balcony is crowded to its limit, all the committee rooms are being used for exhibiting purposes. The New Convention Hall, where the show is to be held, is rapidly nearing completion and will be in readiness for the opening night, which will be the official opening of the building. The entire fifteen dealers in automobiles in the city will show, as will the two manufacturers, the Gearless and the Selden. The accessories, motor boats and motorcycles will all be shown by local dealers, making it an entirely local show. Great plans are being laid for the decorations, which will be a leading feature of the exhibition. It will be a color scheme of green and white, with an electrical display of nearly 15,000 lights arranged for decorative purposes. The Fifty-fourth Regiment band will furnish music.

INDIANAPOLIS SHOW WEEK OF MARCH 23.

INDIANAPOLIS, Feb. 24.—At a meeting of the Automobile Show Committee, held at the Denison Hotel last Wednesday night, it was decided to postpone the automobile show for one week, the new dates beginning March 23.

After considerable discussion it was decided to make the change so that the show and the annual conclave of Scottish Rite Masons could be held at the same time, insuring a larger attendance.

The hill climb will be held on the morning of March 24 on Michigan Hill, which is the steepest and most dangerous hill in the vicinity, if proper arrangements can be made. A silver loving-cup will be presented to the winner of each of the following events: Cars listed at \$1,000 and under; cars listed from \$1,000 to \$1,800; cars listed from \$1,800 to \$2,750; cars listed from \$2,750 to \$3,500, and for cars listed above \$3,500. There will be a parade of the contestants.

APPERSON WINS PASADENA HILL CLIMB.

LOS ANGELES, CAL., Feb. 29.—Remarkable time was made to-day in the feature event of the annual Pasadena-Altadena hill climb by the Apperson Jackrabbit which speeded up the 1.4-10-mile incline at the rate of 52.4 miles per hour, defeating such high-class competitors as the Stearns, Franklin, Packard, Pope-Toledo and Haynes. The grade is said to be 11 per cent., and the Apperson had 18 seconds to spare over its nearest competitor. Winners in the other events were the Thomas Flyer, Oldsmobile, Pope-Hartford, Kisselkar and Tourist.

RECEIVER FOR MERCEDES, BACKED BY MORSE.

Temporary receivers have been appointed for the Mercedes Import Company, a wholesale automobile concern with offices and salesrooms at 590 Fifth avenue, and Charles W. Morse as its financial backer. Recently C. L. Charley, sole selling agent for the German Mercedes Company, became uneasy about the condition of the company and sent his brother from Paris to investigate. The largest creditors are C. L. Charley, \$43,800; Charles W. Morse, \$25,000; National Bank of North America, \$55,479; R. E. Fulton, \$6,300. The total liabilities are \$115,104, and the nominal assets \$146,978.

NEW PACKARD "CLOSE-COUPLED" BODY.

Owing to the varying accommodations required by different purchasers of a car, the selection of types of bodies has been a difficult problem for the maker. Many owners exact from a car, greater carrying capacity than was provided for in its design and this has been the case particularly with runabouts, out of which has grown the odd-looking roadster type with two seats on the extreme rear. Appreciating the demand that exists for a four-passenger car, the owner of which usually drives himself, while the chauffeur is carried in the rear, the Packard Motor Car Company, Detroit, Mich., has just brought out the "close-coupled" body shown in the accompanying photograph. This body is mounted on the regular Packard "Thirty" chassis and has been especially designed for the purposes in view, providing comfortable seats for all four passengers, as contrasted to the runabout on which the rumble is far from comfortable.

In this new design, the passengers are carried midway between the front and rear axles, so that their weight is well distributed on all four springs, and a variation in the load is not so perceptible. It is a particularly safe and capable car for fast driving over rough roads, as the distribution of the weight is such as to give the maximum efficiency under all conditions. The rear end of the body provides storage space for touring paraphernalia. With the new body, the Packard "Thirty" lists at \$4,300, or \$100 more than the regulation touring type.

Attractive Lines of the New "Close-Coupled" Packard.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Springfield, Mass., is to have a combination automobile hose and chemical wagon, and when it goes into service, the city will have no less than five automobile fire wagons, the others being two "flying squadrons," a chief's and deputy chief's car.

Josef Hoffman, the well-known pianist, has bloomed forth as the inventor of an ingenious road indicating device, which has been patented in Germany and upon which patents are now being applied for in this country, through his attorneys, Howson & Howson, New York.

J. D. Lamb, president of the Inland Auto Company, Walla Walla, Wash., and L. H. Thoen, one of the company's representatives, are at present on a tour through their Washington and Idaho territory and report excellent prospects for the season. The concern handles the Franklin line.

Since the new Rambler models were placed on the market in November last, 1,379 cars have been sold, the makers announcing that their December sales exceeded by \$23,900 those of the same month in any previous year, while January showed an increase of \$18,148 of the same kind, something strongly indicates the generally healthy condition of the auto business.

Fire Chief Lally, of the Brooklyn fire department, is enthusiastic over the service given by the Stolp Shock Eliminator on his Locomobile which has now been equipped with the device for several months. He reports that it has given satisfactory service and has required no repairs or adjustments, and that its use effects a great saving in wear and tear on the machine.

With thirteen bidders for the privilege of supplying the city of Camden, N. J., with a runabout for the use of Chief Hollinsworth, of the Bureau of Water, for inspection purposes, the contract was awarded to the Mitchell car. The Philadelphia agents, the Penn Motor Car Company, aver that there is nothing in the silly superstition regarding the unluckiness of the number 13.

Owing to the great increase in their business during the past year, the Autolight & Motor Supply Company, 506-508 North Broad street, Philadelphia, has had to add to its facilities and has just completed a large addition to its building at the above address. This company carries one of the largest and most varied stocks of automobile supplies and accessories and issues an attractive catalogue.

A. P. Fleming, secretary of the Automobile Club of Southern California, has just taken delivery of a new roadster type of Durocar with inclosed body, this being the first 1908 model built in Los Angeles to be completed. It is the product of the Durocar Company, and was built specially to Mr. Fleming's order. Though intended principally for city use, the car has a speed of forty miles an hour and will be used for tours as well.

It has been suggested to Alexander Winton that he rehabilitate the *Bullet No. 2* and enter it in the speed contests of the coming summer. One of the enthusiasts making the suggestion declared that no racing machine had appeared since its manufacture in 1903 that looked faster or more trustworthy. Earl Kiser, now Winton branch manager in Pittsburg, hopes Mr. Winton will decide to start the *Bullet* once

more, for the champion steersman is keen for fresh contests on the track or road.

The New York branch of the White Company has recently sold an ambulance to the Kings County hospital of Brooklyn. The ambulance consists of a standard 30-horsepower chassis with a body similar to those of the ambulances furnished by the White Company to the United States War Department and Navy Department. The suitability of the White for ambulance work has been highly commended by the Quartermaster-General in a formal report on the subject to the Secretary of War.

American methods of automobile manufacture are soon to be tested by the Royal Automobile Club of Great Britain, the technical committee of which will select three single-cylinder Cadillac cars from the London agents' stock. These cars will be dismantled and their parts mixed indiscriminately. The committee will then single out the pieces into three separate piles and the company's mechanics will rebuild the cars from them, without altering any of them, and with nothing but spanners as tools. Upon being reassembled, the three cars are to be run 500 miles on the Brooklands track.

The latest move on the part of an accessory manufacturer to "automobile row" has been that of the Witherbee Igniter Company, located for the past three years at 541 West Forty-third street, New York, soon to be installed in new quarters on the third floor of the Motor Mart, 1876 Broadway. In its new location the company will have more than 8,000 square feet of floor place, thus affording more room for the manufacture and display of Wico ignition specialties. The general offices and sales-room face Broadway, while the factory and charging room occupy the remainder of the space. A. J. Fisk, general manager of the company, is now on an extended trip through the West, establishing a complete chain of branches. A. B. Elliott, the company's vice-president, promises a unique house-warming as soon as the new quarters are ready.

RECENT TRADE REMOVALS.

The Supplementary Spiral Spring Company, of St. Louis, manufacturer of the "Spring of Fame" supplementary springs, has removed its New York office from 52 West Sixty-seventh street to the Motor Mart, 1876 Broadway. M. H. Cormack, formerly vice-president of the Standard Brake Company, is in charge of the office, and his territory includes the States of New York and New Jersey.

NEW AGENCIES ESTABLISHED.

The Schacht Manufacturing Company, Cincinnati, O., have just opened an agency at 1402 Michigan avenue, Chicago. It is in charge of Walter S. Crain, who has long been identified with the automobile industry. A full line of the Invincible Schacht runabouts will be shown.

Following up the aggressive agency campaign upon which he has been busily engaged for some time past, Paul Lacroix has just announced the placing of a Boston agency for the Renault cars. The new representatives at the Hub are A. Cutler Morse & Company, located in the Motor Mart, Park Square, Boston, Mass.

Agencies for the friction-driven Cartercar are being closed all over the country, some of those who have taken on this line within the last few weeks, being as follows: Smith, Clemens & Hopping, Dayton, O.; Knowles & Roland, Demming, N. M.; Parker & Heugabaugh, Ashtabula, O.; Indianapolis Auto Company, Indianapolis, Ind.; Naperville Garage, Naperville, Ill., and Johnson's Auto Company, Boone, Ia.

PERSONAL TRADE MENTION.

Lewis C. Block, of the Ford, Buffalo (N. Y.) branch, has succeeded F. C. Vanderhoof as manager of the Philadelphia branch of that company. The latter has accepted the management of the Bergdoll Motor Company, of Philadelphia. The Philadelphia branch will shortly be moved nearer to the center of activity on "Gasoline Row," the change only awaiting the completion of a new building now being erected at Broad and Vine streets.

L. J. Sackett, a pioneer auto salesman, has just joined the Matheson forces as special representative and at present is at the Matheson plant at Wilkesbarre, Pa. Mr. Sackett is probably one of the best qualified salesmen in the field, as he has not only had a number of years' experience and is known from coast to coast, but he has also had considerable experience and education in the practical end of automobile building, so that he can run and repair cars as well as sell them.

NEW TRADE PUBLICATIONS.

Something of interest on the subject of tire construction is to be found in the publication of the Dow Tire Company, 104 West Forty-second street, New York City, makers of the Dow non-deflation tubes. Colored illustrations reveal the construction of the tire and methods of production.

Of particular interest in the catalogue of the Anderson Forge and Machine Company, Detroit, Mich., is the section devoted to vanadium steels and the tables showing results of tests made. Drop forgings, which form the main feature of the company's output, are also dealt with somewhat extensively.

Small in size, but complete in information, is the characteristic of the booklet dealing with the improved models of Stewart speedometers, produced by the Stewart & Clark Manufacturing Co., of Chicago. The salient features of the Stewart are well presented between the red covers of the little booklet.

In the Reliable-Dayton 1908 catalogue details are given on what is claimed to be the "first real successor to the horse." Four models, three of them of the buggyabout type and one a delivery wagon, are produced by the Reliable Dayton Motor Car Company, Chicago, and their main features are set forth in the catalogue.

Those interested in what an automobile can do with the bonnet sealed down hard and fast will find something to please them in a small brochure from the Mora Motor Car Company, of Newark, N. Y. Press comments on what was probably the most extensive sealed bonnet contest ever run off constitutes the main portion of the booklet.

INFORMATION FOR AUTO USERS

"Oilzum" Carbonless Oil.—Under this title, the White & Bagley Company, Worcester, Mass., are manufacturing a special brand of cylinder oil, particularly refined for gas engine use. It is intended as a lubricant for the piston, wrist pin and main bearings, and its

"OILZUM" SPECIAL CYLINDER OIL.

makers claim that it will keep the cylinder head and piston rings free from carbon for the longest period of steady service. The same concern is also placing on the market a special automobile

"CLEANZUM" DIRT REMOVING COMPOUND.

soap known as "Cleanzum Antiseptic Hand Cleaner" which will instantly remove oil and grime from the hands without injury to the skin. They will show a full line of their products at the coming show in Boston next week.

Smith Taximeters.—S. Smith & Sons, Ltd., 9 Strand, London, Eng., the well-known English makers of the Smith Speed Indicators, have just placed a new taximeter on the market. It has been in constant use by the London municipal authorities for the past three months and has also passed the Scotland Yard test successfully, besides receiving a certificate from the observatory at Kew for accuracy. The instrument is 8 inches high, 7 inches wide and 5 inches deep. It is operated on the well-known horo-metric system, i.e., showing the amount of fare according to the time occupied or distance traveled, the dial indicating total fare and extras. The Smith taximeter is of extremely simple construction and although substantially made throughout weighs but 15 pounds. The clock movement is of the two-day type and

is of S. Smith & Sons make. The usual flag is provided to show when the vehicle is at liberty, and by means of a lock for which the driver carries the key the instrument may be made proof against tampering by the mischievous small boy. The wheel attachment is very simple, an arm actuated once at every turn of the wheel pulling a wire concealed in a flexible shaft and moving the driving wheel of the taximeter one tooth. This causes the working to be very slow, with a consequent absence of wear. The Smith taximeters are being placed on the American market by the firm's branch house, located at 116 Broad street, New York.

"Wisconsin" Tire Protector.—One bad feature of many tire protectors is the constant tendency to loosen that they exhibit in service. This is a feature that has been given special attention in the "Wisconsin" tire protector, which is being manufactured and marketed by the Tire Protector Company, Stevens Point, Wis. The general construction of the protector will be plain from the

ATTACHMENT WISCONSIN TIRE PROTECTOR.

accompanying illustration, the method in which the defect in question is overcome consisting of the use of six loops in the continuous circular wire to which the hub connections are attached, as shown. The wire is hard steel and the tendency of the loops is to spring back straight, which causes them to exert a tightening effect upon the protective cover, drawing it closer to the tire. The base of the protector is made of rubber and fabric, while the tread is of the best chrome leather studded with rivets upon which the wear comes. This construction prevents the stretching and bagginess that is inevitable with protective covers made of leather alone, while any slackness from wear and service is automatically taken up by the steel wire ring already mentioned, and to which the protector is laced all the way round. As an instance of the durability of this rubber and leather combination, it may be mentioned that one set has been run

more than 4,000 miles in the past 18 months and is still in excellent condition. During that time the tires were never punctured.

K-W Special Magneto.—In order to meet the constantly increasing demand for a magneto within the reach of owners of small cars, the K-W Ignition Company, 34

K-W SPECIAL MAGNETO ON FORD.

Power avenue, Cleveland, O., have just brought out a new magneto, known as Model F, which has been designed especially for use on the four-cylinder Ford runabouts, but which can be used on any automobile. The accompanying illustration shows the manner of installing it on a Ford, a substantial bracket being furnished by the makers for this purpose, the magneto being mounted by attaching this bracket to the frame of the car. It is equipped with a pulley for driving from the flywheel by means of a one-inch belt, and to avoid trouble from the use of the common article the makers will supply a non-stretching, waterproof belt at a cost of \$1. The K-W magneto has been wound especially for use in connection with the coils employed on the Ford cars and a large number of them have been sold for installation on the latter.

The Crane Puller.—Nothing so emphasizes the value of a tool as the number of uses to which it may be put in case of emergency, and this is something for which

ONE METHOD OF USING CRANE PULLER.

the Crane puller, made by Crane Puller, 53 State street, Boston, is specially designed. It may be used as a jack, for removing

sprockets and wheels and for many uses in the repair shop, such as removing a fly-wheel, or as an arbor press, while many other uses will suggest themselves to the ingenious amateur or repairer. These tools are made in several sizes, the No. 2, provided with two sets of arms, long and short, being especially designed for the use of the autoist. The beam is 10 inches long, and the long arms are 9 inches long in the clear, while the short arms serve to pull off anything under a length of 6 inches. The total weight of the tool is 12 pounds and it is guaranteed to stand a strain of six tons.

Herz Tandem Pump.—The constantly increasing size of automobile tires has made the task of pumping them by hand burdensome, and a number of tire pumps have been placed on the market, but the average autoist prefers not to have a pump permanently installed on the car. To avoid this objection, Herz & Company, 203-205 Lafayette street, New York, are placing on the market a hand lever flywheel-friction type of pump known as the "Tandem."

TANDEM PUMP.

It is adapted to "knock down" for packing in the tool box, and for use merely has to be held against the frame of the car and pressed against the revolving flywheel. The same concern also makes the well-known "B.B.," which is a double piston type designed to be attached to the frame and driven by gear, chain or belt. The Herz distributor is another of their specialties that has been on the market for several years. In this, the primary contact is of the press type, and occurs between two hardened tool-steel pins, pressed against each other by

VIEW OF HERZ DISTRIBUTER.

a revolving hardened steel cam plate. The secondary current enters the center of the removable cover and is distributed by a metal segment to the four or six plugs. An extra quality hard rubber cover is employed, and is kept in place by the Herz patented spring nuts.

Marine Spark Plug Protectors.—All motor boat owners who have suffered the petty annoyance caused by water reaching the spark plug will appreciate the protector produced by A. R. Mosler & Company of 163 West Twenty-ninth

PLUG COVER.

MOSLER CONTROLS.

street, New York City. As will be seen by accompanying illustration the protector consists of a heavy, porcelain hood, screwed on to cable and securely held by spring socket. While making a hermetically sealed connection, the hood is easily removed.

The same firm has recently placed on the market a new distributor for operating multiple cylinder engines with a

MOSLER SINGLE-CYLINDER DISTRIBUTER.

single vibrator coil. One of its most valuable features is a patent separable case allowing immediate access to primary contacts without removing wires. At the same time the primaries are absolutely water and dust-proof. The secondary terminals are carried by hard rubber casing and heavy plate glass. Mosler self-clamp controlling and cut-out levers for use on automobiles and motor boats are a simple and reliable attachment made with either single or double levers and built for either horizontal or vertical control.

New Harris Spout Cans.—While nothing can be of greater importance than the provision of proper lubricating oil for the automobile motor, the necessity of having it in a suitable container for the convenience of the user is a matter of no little import to the autoist. The A. W. Harris Oil Company, Providence, R. I., realizing this, brought out a new line of cans this year and the favorable reception with which

they have met shows conclusively that the manufacturers' efforts in this direction have been appreciated. The Harris one-gallon can is a decorated package bearing the word "Light," "Medium" or "Heavy," designating the grade of oil, and is equipped with an extension spout, which is held on top dur-

HARRIS CAN WITH EXTENSION SPOUT.

ing transit. This spout is easily applied and at once transforms the gallon receptacle into a practical oil can with which almost any aperture can be reached. The Harris five-gallon can is similarly decor-

HARRIS FIVE-GALLON SPOUT CANS.

ated and equipped, the extension spout permitting the can to be tipped so that the oil may easily be poured into any other receptacle. Two five-gallon cans are packed in a wooden case.

Auto Limerick Competition.—Limerick experts have an opportunity of adding to their car equipment by means of a competition announced by the Allen Auto Specialty Company, of 1931 Broadway, New York City. All the prizes in

SECOND PRIZE IN LIMERICK CONTEST.

the contest are taken from the Allen company's lines of specialties and include such useful articles as tire holders, tire lock, tire and lamp covers, etc., varying in value from \$10 to \$3.50. Duplicates of the prizes can be seen at the selling branches of the company in New York, Philadelphia, Boston and Chicago.

THE AUTOMOBILE

New England's Big Show

BOSTON, March 11.— Remarkable expansion has been the characteristic key note of the annual exhibitions of the Boston Automobile Dealers' Association, and the Sixth Annual Show, which opened in Mechanics Building on Saturday evening with an attendance of over 30,000 people, is the most comprehensive exhibit of automobiles,

judging from the sales reported during the opening days of the show, the Boston public had not been supplied, to say nothing of the New England back counties which had still to be heard from.

Not only has the Boston show been an exception to the general run this season in that it has been a success from the point of view of the exhibitors

automobile-making material and accessories that has ever congregated under one roof in the New England States. Hitherto much of the available space has been taken up with exhibits of motor boats, so much so that it has been necessary to secure extra space in Horticultural Hall in addition to Mechanics Building. The advantage of an exclusive automobile and accessories exhibit is at once apparent to the visitor in the tasteful arrangement of the cars and the ample space allowed for a comprehensive inspection of the wares displayed. The motor boat element has, however, not been entirely eliminated, as in the basement two or three models are shown. But the basement is primarily devoted to the commercial car, the display of which is in keeping with the rapid progress which is being made in the development of this important branch of the industry. Poor lighting here, however, detracts from the effectiveness of the exhibits.

who gauge show success by the number of orders taken and the prospects listed, but it has been a success from the mechanical standpoint, for it is the most complete show that has been held. No discriminating line whatever is drawn in Boston between any factions of manufacturers; they all bunk together in harmony, and this accounts in no small measure for the completeness of the exhibit. But of more importance, perhaps, is the fact that now the majority of the manufacturers have their complete line ready for 1908. When the New York shows were held in October and November, and even at the time of the Chicago show in December not all the manufacturers by any means had their cars ready for exhibition and they had to rush through show material. Since those shows, however, the factories have been at work producing the regular line of cars for the riding season, and they are shown complete for the first time at this exhibition.

Business Brisk from the Start.

When it was officially announced that 32,000 people had visited the show on the opening night, and that even in the midst of that tremendous crowd which practically filled every available inch of space in the huge building, sales of cars had been made, the statement seemed almost a miracle. In fact, it seems as if the public had been waiting for the opening of the show before doing business. All through the winter cars have been sold in Boston, probably in greater numbers than in most of the other large places, and there are not a few leading dealers who can show a better business through November, December, January and February than last year, but

Not a few of the manufacturers who have traveled the show circuit are loud in their praise of what Boston has to offer and any doubters of the value of a late show in New England for retail purposes have been completely won over.

General Effectiveness of Decorations.

As usual, the Boston dealers have scored another success with the decorations and general set up of the exhibits. The Japanese garden scene promised by Manager Chester I. Campbell comes up to the vivid advance descriptions, which is saying a good deal. While the temple gate effect in Grand Hall is not quite as picturesque as were the apple trees of last year, it has the advantage of giving a more roomy appearance to

Where the Show Holds Forth.

the hall. In Exhibition Hall, where the aisles are all covered by wistaria arbors, the effect is exceedingly picturesque and the prestige of Grand Hall as the best part of the show is in danger. Exhibitors who have had much experience in other places are considerably surprised at the generosity of the Boston show management, which supplies along with the space and for the price thereof, not only the decorations, carpeting and the like, but the signs, the furniture and free telephones connecting with all parts of the building and with all sections of the metropolitan district.

There is a great variety at this show, greater, perhaps, than at any previous exhibition of the year, for there are included under the same roof domestic and foreign machines, licensed and unlicensed, gasoline, steam and electric, pleasure and commercial vehicles, and almost every different variety of design of body or chassis. Such prominent foreign cars as the Fiat and Renault, such leading Selden licenses as the Packard, Pierce, Peerless, Locomobile, Lozier and Royal; well known independents like the Ford, Rambler, Rainier, Maxwell and Reo; gasoline car makers of both divisions, the White, Lane, Clark, Stanley and others of the steamers, the Baker, Bailey and Studebaker in the electrics, pleasure car makers too numerous to mention, the Rapid, Studebaker and other manufacturers of commercial vehicles are all in the Boston show.

At this show Boston has made the acquaintance for the first time with the high-wheeled motor carriage, and they appear to be good in wind and limb, and well adapted for some of the roads up north. As many as a half-dozen different makes of buggies are on exhibition, and agencies have

been placed for two or more in Boston. It is noticeable that the horseless buggy idea is taken to rather partially by the show visitors from the rural parts.

Another novelty for the Boston show is a complete tire exhibit. Last year the leading tire manufacturers did not exhibit in Boston, but this year they are here in force, and are trying to make up for the loss which they suffered from not taking space a year ago. It has reached a time when

the retail purchaser is about as much interested in tires as he is in the automobiles themselves, and the tire exhibits are noticeably popular. The other accessories exhibits are complete, and occupy the whole of the large galleries of the two main halls of the building.

The idea of using the basement for the exhibition of pleasure carriages has not taken very well, and though there are a number of cars in the basement, the agents for which could not secure space on the main floor, it has been found difficult to get the crowd below stairs that accumulates around the exhibits above. There are several good exhibits of commercial wagons in the basement and some instructive exhibits of parts and of machinery.

One specially interesting division of the basement department is the model repair shop. Plans for this were secured by a competition conducted by the man-

agement. The shop occupies the space under the stage, and in it is some up-to-date machinery adapted for the work.

It is too early to make any prediction about what the Boston show will accomplish in the way of business, but, if the first few days may be taken as a criterion, the exhibitors are laying out a large amount of work for the remainder of the season.

SOME NEW THINGS UNCOVERED AT THE HUB'S SHOW

BOSTON, March 12.—Boston's show has always been noted for the number of new things that make their debut at this closing event of the show season. New England has been the home of the manufacture of small metal wares for more than a century past, so that it is hardly to be wondered at that many of the novelties in the shape of accessories first see the light "Down East."

Only New Car in Show, Auto Buggy.—A New England recruit to the buggy type of automobile has been presented within the last few days by the Crown Motor Vehicle Com-

pany, with factories at Boston and Amesbury, Mass. The power plant of this popular type of automobile is a double opposed air-cooled motor with a bore of 4 3/8 inches and stroke of four inches, rated at 12-horsepower. Current is supplied by special storage batteries, and ignition is by jump spark. Lubrication is through a force feed sight oiler. The engine has three-point suspension and is controlled by spark and throttle levers in convenient position.

On account of its ability to withstand rough usage, an individual multiple disc clutch has been selected as the first

unit in the transmission of power from the engine to the road wheels. There are two forward and two reverse speeds, through sliding gear, and spur gear type of differential. All bearings are of Parsons white bronze and of ample size. Brakes are of the double expanding type on the rear road wheel drums.

To ensure easy riding over rough roads, full elliptic springs are fitted front and rear, and carry an angle steel or laminated wood frame and special "Crown" body. The 40 by 1 1/8-inch Sarven patent wheels are equipped with solid rubber tires. Maximum speed is declared to be 30 miles an hour.

Automatic Meshing Gear-set.—Among the exhibits that attract the mechanical sharps is one that causes the man on the lookout for new things to stop and look it over. It is an automatically meshing gear-set, of which H. O. Fletcher, of Hyde Park, Mass., is the inventor. The model shown only

Oldsmobiles Were Well Placed Near Main Entrance.

provides two speeds forward, but suffices to show the principle of the device, which consists of a double-faced jaw clutch, placed between a right and left-hand worm and corresponding to similar clutches on the speed pinions of the main shaft of the set. The sliding pinions are shifted in the usual manner, but it is impossible for the car to go ahead on a certain speed until the pinions representing it are fully in mesh, as the pinion engaged runs loosely on its shaft, but as soon as the revolving gear picks it up it moves toward the jaw clutch on a long-pitch worm until it engages and then becomes solid with the shaft. For the other speed, the worm is cut in the opposite direction. When disengaging the pinions are automatically moved away from the clutch.

A New Shock Absorber Represented.—"Cars are invariably suspended by 'leaf-springs' because the leaf-spring principle has proved to be the only principle having the strength to carry the weight, combined with the resiliency to absorb

Studebakers, Reos and Premiers Were Neighbors.

A Warm, Spring Sun Lighted Up the Rambler Display.

The Air-cooled Franklins Had an Artistic Setting.

shocks," says the maker of the new Du-Ro shock absorber, of which Duncan Robinson, 89 State street, Boston, Mass., is the inventor and manufacturer. It consists of a stationary hub, rigidly attached to the car frame, and surrounded by a revoluble ring. A steel chain attached to one end of the ring, and partially encircling it, is attached at its other end to the axle or running gear of the car. Thus any movement of the car frame pulls on the chain and turns the ring, the movement of the latter being resisted by a set of powerful leaf springs. A shock turns the ring against the progressive resistance of the springs until the force of the shock is equalized by the power of the resistance, thus quietly absorbing the disturbance. This progressive resistance begins at nothing and increases as needed by calling into play more and more leaves, and as the strength of the latter has been designed to be greatly in excess of any possible demand, there is a proper amount of resistance to counterbalance every shock, whether small or great.

Sterling Alternating Ignition Device.—When a direct current passes through the platinum contacts of a vibrator coil continuously in one direction, the same action takes place as is noticed in the carbons of an ordinary arc light, the positive being disintegrated and the resultant material being transferred to the negative, causing a point to form on the latter and a crater on the former, and when the points get in this condition they are said to be pitted. They then no longer give good service. The Sterling alternating ignition device has been brought out to overcome this, and, according to its makers, the Sterling Alternating Ignition Company, Binghamton, N. Y., its use permits of enjoying all the advantages of the battery type of high-tension ignition, without any of its drawbacks. For a four-cylinder engine, a standard timer with four stationary contacts is employed in connection with four simple coils having neither vibrators nor condensers. Included in these connections are four normally closed switches—one at each coil, there being a common condenser for all the coils. It is connected across the single vibrator employed and the alternating current through the latter leaves the contacts smooth and clean. Only one adjustment is necessary on the system, while it is possible to stow the coils anywhere on the car. Individual button switches are provided for testing purposes. The same concern is showing the Sterling double contact timer, which is of the roller type, but departs from the usual practice by employing two rollers set opposite each other, thus balancing the strain on the shaft and reducing wear to a minimum. To supply the demand for a cheaper timer, the same firm shows the "M. I. P.," which is also of the roller type.

Bullet-proof Cloth Among Novelties.—It may appear at first sight that bullet-proof cloth, while not a novelty frequently seen at automobile shows, would be rather out of place at any function of the kind. But a little consideration makes it plain that a cloth which will stop a bullet will also stop the obnoxious horseshoe nail, the piece of jagged glass and the thousand and one other things that find their way into the pneumatic tires in the course of service. The cloth is the invention of Casimir Zeglen, and is manufactured by the Zeglen Bullet-proof Cloth Company, South Bend, Ind. It is made of raw silk woven in a special manner, and is made in various thicknesses, the entire substance being merely a textile fabric. This material has been applied to the lining of an automobile outer shoe in the same manner in which the ordinary canvas fabric is employed. The most severe tests failed to puncture the tires, the attack being made in one case by means of two boards placed about 60 feet apart and filled with long French brads, one-third of which were bent to point toward the approaching tire, one-third standing upright, and the remainder leaning away. Half a dozen broken bottles were also strewn on the road and

(Continued on page 375)

Though the Racing Was Decidedly Meager, the Onlookers Were More Numerous Than Ever Before.

FLORIDA'S MEET SUPPLIED MORE RECORDS THAN RACES

By JOHN C. WETMORE.

ORMOND, FLA., March 7.—Thanks to the gallant doings of the little guard of skirmishers that the Automobile Club of America had succeeded in gathering to preserve the continuity of the racing tournaments on Florida's far-famed sands, the sixth annual Ormond-Daytona meet in the wind-up was not only saved from utter failure, but there was even revived some of the glories of the past through several noteworthy and successful assaults on Father Time.

During the concluding two days of the meet, the fickle goddess of fortune came to Florida's rescue with favoring winds and a fast beach, and a healing touch to the infirmities that earlier in the week had crippled several of the beach invaders. As a result of their four days of campaigning, the coterie of contenders carried away with them quite a full bag of new records for the season's advertising.

A notable achievement of the meet was Emanuel Cedrino's 300-mile run on Thursday with the 60-horsepower Fiat Cyclone, shod with Continentals. In this race the Italian-American covered the three centuries in 3 h. 53 min. 44 sec., an average of 77.02 miles an hour, as against the record average of 70.8 miles, scored by Nazzaro in the last Grand Prix run. Incidentally, en route, Cedrino put up 3 h. 16 min.

48 2-5 sec. as a new figure for 250 miles, gaining this added honor. The one long-distance record for the beach—that for the previous maximum of Florida racing, 100-miles in 1 h. 15 min. 40 2-5 sec., scored by Clifford Earp and a Napier in 1906—was supplanted by 1 h. 12 min. 56 1-5 sec., thanks to Maurice Bernin and his speedy 60-horsepower Renault, wearing Michelin, a performance whose merit may be judged by the average of 82.26 miles per hour it showed.

Records for the beach were established for 125 and 150 miles by Louis J. Bergdoll, of Philadelphia, with his 60-horsepower Benz stock car, Continental tired. On Tuesday, the opening day, in the 150-mile stock car race, he scored 2 h. 10 min. 38 sec. for the 125 miles and 2 h. 50 min. 33 sec. for the 150 miles. The following day, in the invitation race for amateur drivers, he cut the 125-mile figures to 1 h. 52 min. 30 2-5 sec., an average of 66.36 miles per hour.

The members of the Automobile Club of America contest committee, which conducted the races, expressed themselves as satisfied with the outcome of the meet, and not at all regretful at having put it through with the limited field of entries. The paucity of the contenders was attributed to unfavorable trade and financial conditions; the

Official Stand, Where the Notables of Automobiling Gathered.

Among those to be seen in the picture, starting from the left, are Committeeman A. H. Whiting, A. C. A.; Vice-president George E. Sebring, of the F. E. C. A. A.; Harlan W. Whipple, ex-president of the A. A. A.; Major J. B. Foote (in the foreground), president of the F. E. C. A. A.; S. B. Stevens, of Rome, N. Y.; Referee Robert Lee Morrell (at telephone); Committeeman A. L. Riker, and Timer S. M. Butler.

promotion of another meet next year is favored in club and trade circles.

Among the racing fans in attendance, the opinion was unanimous that the substitution of long for short-distance racing on the beach was a wise innovation. That interest in the Florida races is unabated with the general public was proved by the Ormond Hotel being crowded, despite a poor season and no perceptible diminution in the crowds on the beach, at least early in the week, being noticeable. How great an influence on the hotel business this racing has had may be judged from the fact that the first year of the tournament, in 1903, the January house count at Ormond was 1,200; that it rose to 3,000 in 1904, and to 5,000 in 1905, the banner year, and that the present little meet enabled the hotel to beat the record of a previous year's successful corresponding week.

Mr. and Mrs. Paul Lacroix and Cedrino

What Happened the Opening Day.

The racing began on Tuesday with the annual 100-mile run for the Minneapolis cup. The course was a 12 1-2-mile stretch, at Daytona, furnishing a 25-mile circuit with eight turns in all. Three cars faced Starter Wagner: Harry Levey's 120-horsepower Hotchkiss, which Elliot F. Shepard drove in the last Vanderbilt Cup race, piloted by Harry B. Shefts; E. Rand Hollander's 60-horsepower Fiat Cyclone, a middle-weight racer equipped with the engine of last year's German Emperor car, driven by Emanuel Cedrino, and W. Gould Brokaw's 120-horsepower front-drive Christie, which Walter Christie built and raced in last year's French Grand Prix, and which later captured a mile record of 35 seconds on Atlantic City's beach, with E. B. Blakely at the wheel.

The Hotchkiss was first away, but stopped in a furlong with a slipping clutch, the Fiat taking the lead and reaching the turn at the Inlet in 5:58. Then its troubles began with losing one of its light front wheel racing tires, which came off and had to be replaced, only to be lost again. Cedrino reached the clubhouse (20 miles) in 15:25, running on a bare rim, just as Earp had done two years before in the same race. A second tire was put on, only to be again lost. From this point Cedrino continued on three tires and a rim. In the mean time the luckless Christie "Big Bear" had broken a valve and been put out of the race, and the Hotchkiss had mended its clutch after a long delay and again taken up the running. The score by laps tells the story of the race.

Driver.	Car.	25 miles.	50 miles.	75 miles.	100 miles.
Cedrino (Flat)		26:39 4-5	64:05	85:05	110:20
Shefts (Hotchkiss)		42:37	77:51		

The Hotchkiss completed 75 miles, but was not timed after being scored at 50 miles. Cedrino had lost 30 minutes in all in replacing tires. Incidentally, Cedrino won the \$100 prize offered by Joseph M. Gilbert for a victory on Continental tires and demountable rims.

Four cars were at once started in the 150 stock car race: Louis J. Bergdoll, 60-horsepower Benz; James Laughlin, 3rd, 40-horsepower Cleveland; J. Carey, 70-horsepower Thomas; and E. W. Howard, in W. Gould Brokaw's 40-horsepower Allen-Kingston. The contest quickly became a runaway for Bergdoll, with Laughlin a hopeless pursuer for 100 miles, the Allen-Kingston being towed back from the inlet with a melted bearing, and the Thomas quitting when it lost a tire.

The Benz cantered over the course an easy winner, completing the laps as follows: 25 miles, 25:15; 50 miles, 61:02; 75 miles, 85:32; 100 miles, 107:31; 125 miles, 130:38; 150 miles, 2 h. 40 min. 50 sec., establishing records for the last two distances. The Cleveland's score was: 25 miles, 46:32; 50 miles, 77:24; 75 miles, 109:37; 100 miles, 2 h. 26 min. 46 sec. The Thomas got as far as the 25-mile post in 43:06.

The Amateur Race on Wednesday.

The condition of the beach on Wednesday, though somewhat improved, was such that the committee decided to stick to the 12 1-2-mile Daytona stretch for the running of the 125-mile amateur invitation race. S. B. Stevens, a veteran Ormond Beach pilot, was at the wheel of the Fiat Cyclone; W. Gould Brokaw's "Little Christie" of 60 horsepower was entrusted to R. G. Kelsey, and Louis J. Bergdoll was again on hand with his Benz "60."

Again there was a tale to tell of shattered hopes, and one of these races that are not always to the swift; for, after running with a safe lead for 50 miles, Stevens pulled up limping at the clubhouse (70 miles in 58:18) with a broken rocker arm. The missing part was not at hand, and 29:05 was lost in getting a replacement from the garage at Ormond. With such a handicap, so speedy a car as the Benz was not to be caught. Its owner, Mr. Bergdoll, and the car were in fine form, and won easily, cutting off a big slice of the previous day's 125-mile record figures, with the following score:

Driver.	Car.	25 miles.	50 miles.	75 miles.	100 miles.	125 miles.
Bergdoll....	Benz	22:54	46:41	67:49	90:25	113:30 2-3
Stevens.....	Flat	20:40	41:37	70:05		
Kelsey.....	Christie	37:07	65:46			

Stevens made a game but hopeless chase of it, reaching the 95-mile post in 1:54:28, when he stopped.

Referee Morrell Overseeing a Start Involving the Flat, Christie, and Hotchkiss.

A 300-mile World's Record.

With the third day's racing on Thursday came the redemption of the meet at last through an excellent contest in which three of the four contenders survived to the finish. The world's average speed for an international cup distance was broken, and the famous stretch of Florida beach sand took on once more the unrivaled racing shape that has given it fame as the fastest motor car race course on earth. In this, the chief event of the tournament, the 256-mile run for the Club cup, for the first time during the tournament those worthy Italian and French rivals met; Bernin having at last repaired the damage done the engine of Paul Lacroix's new 60-horsepower Renault racer through the breaking of an oil-feed in preliminary practice. Cedrino, as a matter of course, was at the wheel of the Fiat Cyclone. On behalf of the United States, two Christies essayed to go against the foreigners: the 120-horsepower "Big Bear," piloted by E. B. Blakely, and the "Little Christie" 60, driven by R. G. Kelsey. The race was run over the entire beach course of 16 miles, in eight circuits of 32 miles each. The race was originally scheduled for 288 miles, but through fear that the incoming tide might rise too high before that point was reached, it was agreed before the start to reduce the distance to 256 miles.

Bernin and Renault Which Won the 100-mile Match.

Cedrino and the Continental-tired Cyclone.

As may be imagined, there was eager rubbernecking for the one that should first be sighted returning from the Inlet. It proved to be Bernin, who completed the 20 miles in 15:59, followed by Kelsey in 18:58 and Cedrino in 19:36. The Fiat had stopped five minutes to replace an igniter. The first lap was completed with Bernin still in the lead, pursued by Cedrino, who had passed Kelsey.

In the next lap, tire troubles befell the Renault, which was the beginning of its final undoing. Thrice did Bernin have to stop, twice to put on a new rim and once to make a complete change of shoe and tube.

The 100-mile post was reached by Cedrino in 81:39 3-5; by Bernin in 97:33 3-5, and by Kelsey in 98:27. All three thus qualified for the sprints on the following day.

For 84 miles the race was fairly close between Cedrino and Bernin, but after that two stops for replacements made the Renault's chase of the Fiat almost hopeless, though the Frenchman persevered to the end.

Cedrino finished in whirlwind style, not having had to stop to change his tires; his time for the 256 miles being 3 h. 21 min. 27 2-5 sec. The final brush for second place between Kelsey and Bernin was exciting, but a quarter of a mile separating them at the tape. The American finished twelve seconds ahead of the Frenchman. The big Christie had sucked a bit of the porcelain plug into the cylinder and was

early out of the running, though Blakely struggled on for two circuits before quitting. The score:

Driver.	Car.	32 miles.	128 miles.	256 miles.
Cedrino.....	Fiat	29:16	103:11	201:27 4-5
Kelsey.....	Christie	31:15	123:55	246:26
Bernin.....	Renault	25:37	117:40	246:38

Cedrino covered 250 miles in 3 h. 16 min. 48 3-5 sec. It had been arranged during the progress of the race that the Fiat should continue for new figures up to 300 miles, which distance was made in 3 h. 53 min. 44 sec.

Century and Sprint Records Go.

For the get-away day of the meet, Florida's favorite saint had favored the motorists with a fast beach and a stiff wind

Louis J. Bergdoll and Benz Big Cup Winner.

In Front of the Clubhouse at Daytona, Where Thousands Gathered Expectantly and Departed Disappointed.

from the South for the record trials of Friday. Four cars had qualified for the sprints by averages of 60 miles an hour or better for 100 miles or more.

All faced the electrically-operated tape. They were: Bernin, Renault; Cedrino, Fiat; Bergdoll, Benz; and Kelsey, 60-horsepower Christie. After the other contestants had had their fling at Father Time, Cedrino made his run with the Fiat. The result was a record of :35. Though it does not approach, of course, the :28 1-5 made by Marriott with the Stanley steamer, or the :30 3-5 scored by Demogeot on this beach in 1906 with the 200-horsepower Darracq, or the :32 3-5 made by H. L. Bowden with the 120-horsepower overweight Mercedes in 1905, it has only been beaten by one long-distance gasoline car, the 80-horsepower Napier, which Arthur MacDonald drove in :34 2-5 in 1905. Walter Christie tied it with :35 in the *Great Bear* at Atlantic City in 1905. As before stated, however, Cedrino sets up a new middleweight record in place of the :40 3-5 scored by Guy Vaughan in the 80-horsepower Darracq in 1906.

Bernin with the Renault was content with :39 1-5, with long-distance racing equipment. R. G. Kelsey made :42 4-5 twice in succession with the Little Christie, and L. J. Bergdoll scored :45 4-5 and :45 3-5 with the Benz, G. P. Parker driving.

After the racing was all over, David Bruce Brown, a New York schoolboy, who had run away to attend the meet and had made friends with Cedrino, begged to be allowed to try for the amateur record of :39 held by W. K. Vanderbilt, Jr., since 1904 with a 90-horsepower Mercedes. The official consulted, and set up the wire traps for him. The youngster took the wheel of the Fiat Cyclone and captured the amateur record with a mile run in :35 3-5.

Honors were made fairly easy between the rival foreign cracks and tire makers by the outcome of a 100-mile match race between the Renault, driven by Bernin, and the Fiat Cyclone, with S. B. Stevens at the wheel. The wager was \$200 a side. This time Michelin tires did themselves proud and made a strenuous century without being touched. The reliable Renault ran without a skip, won the match hands down, and at the end had gathered to itself a new world's record for the distance of 1:12:56 1-5, supplanting Clifford Earp's 1:15:40 2-5 made with the Napier in the race for the Minneapolis cup in 1906. The score tells the tale in part:

Driver.	Car.	24 miles.	56 miles.	88 miles.	100 miles.
Bernin.....	Renault	17:42	41:02	64:10	72:56 1-5
Stevens.....	Fiat	20:42	44:02	75:02	83:59

The Renault led from start to finish. At four miles Stevens stopped at the stand, thinking there was trouble with his engine, found none, and continued. Further down the beach, however, he lost five minutes in replacing an igniter. The Fiat lost some of its speed of the day before and Cedrino attributed it to the big sprockets put on for the record trials and the feeding of too much gasoline. The attempt to break

the stiff wind with the big sprockets for a long distance slowed him.

Most of the officials of the meet left for the North Friday night, but all of the newspaper men, photographers, and several tradesmen stayed behind for the Savannah meet.

One of the Disastrous Incidents of the Meet.

DAYTONA, FLA., March 8.—There was some talk of a damage suit involving James Laughlin, 3d, of Pittsburgh, who loaned his Cleveland car, and R. G. Kelsey, of New York, the man to whom he loaned it. The loan was on Thursday night, and Mr. Kelsey, driving up the beach at high speed, because of the fog, ran into the wreck of the old ship that has rested in the sands for many years. Twenty-four hours later the car was dug out at low tide. The difficulty has been adjusted by Mr. Kelsey agreeing to have Mr. Laughlin's car rebuilt and made as good as new. This car is the Jacksonville-Miami pathfinder.

Cadillacs Lead at First Jacksonville-Miami Control.

ORMOND, FLA., March 10.—At 6:45 to-day the first of the contestants in the Jacksonville-Miami run arrived here, having covered 84 miles. The leading Cadillac had a second Cadillac in tow, disabled through a collision with a tree. The other starters, Peerless and Maxwell, have not reported.

DAYBREAK START FOR BRIARCLIFF RACE.

The start of the Briarcliff Cup race for stock chassis has been fixed at 4:45 a. m. on Friday, April 24, the machines being sent away from a point opposite the Briarcliff Manor. The grandstand privileges have been sold outright, the money so obtained, together with the entry fees, being sufficient, according to the committee, to ensure financial success.

Old Wreck Which Wrecked the Cleveland.

THE PERFECTION OF AUTOMOBILE IGNITION*

By J. O. HEINZE, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

WHAT has been troubling us more than anything else about an automobile and its engine is to perfect an ignition system that shall be accurate and positive. Daimler used in his early engines a separate iron chamber which was attached to the cylinder and opening into it, which was kept very hot by an outside flame. Into this chamber was injected a spray of gas, or crude oil, which ignited by coming in contact with the hot walls. Later on he employed a small closed platinum tube inserted and opening into the cylinder for the same purpose. The great objection to this system was the inability to definitely fix the moment of ignition in relation to the position of the piston in the cylinder and to insure at all times a positive ignition for every explosion stroke; also, in not being able to make the ignition rapid enough to propel engines at high speed in order to increase the power of the engine without increasing its weight. Otto used another form of ignition, differing from Daimler's, employing a separate gas flame burning near an opening in a slide valve, which carried momentarily a part of the flame into an opening in the cylinder, but he experienced the same difficulties that Daimler did.

My topic is the present-day electrical ignition and the various systems employed, also their mechanical construction and relative efficiency. I do not wish to refer to any one particular make of ignition apparatus, for I believe they all have merits, and the fact that much of our apparatus in the past did not prove efficient was because the various makers of ignition apparatus were not thoroughly equipped with instruments for standardizing their work. It was not because they did not see the wisdom of thus making absolute measurements of all the elements entering into the design of ignition apparatus, but such instruments for making measurements of this kind had not been designed and we were all, therefore, laboring under difficulties and guessing at results. Also, many of our past failures in the efficiency of apparatus were not due so much to the principles involved as they were to poor workmanship and general design, not using the right kind of material nor the proper proportions to give strength and durability.

Automobile Requirements Were New.

When I first began the manufacture of ignition apparatus, and particularly spark coils, some three years ago, I entered the field with some fifteen years of experience in making spark coils producing from one-half inch to fifty-inch sparks in length, and naturally thought I was well equipped for making coils for automobiles, but I soon discovered that there are tricks to all trades, and while I was able to easily make a coil to produce a half-inch spark, still it would not do the work satisfactorily, for it would not respond to high engine speeds; nor was the explosion very strong, and the battery would discharge in a very short time, due to a large current consumption and many other defects, reducing the life and durability of the apparatus, owing to the conditions to which they were subjected in an automobile, such as vibration, heat and cold, and one other element, the desire of every automobile driver to locate all his troubles in the ignition apparatus. If his valves did not seat properly and he had no compression the spark coil was at fault. If his spark plugs got sooted by too much oil and carbon, it was the fault of the coil. If the gasoline pipe got plugged and the carbureter did not get any gasoline, he would try to find the fault in the coil.

Having briefly rehearsed a little history familiar to you all, I will now state some of my observations and experiences during the past few years. We all know that what is needed is a very hot spark, of great frequency, positive, and of a certain length, to penetrate the gap in the spark plug which is generally from

1-64 to 1-32 inch. We also know that with higher compression in the cylinder the spark should be longer and of a higher voltage, or, to be more precise, it requires a good 1-2 inch spark to jump a 1-32 inch gap at 90 pounds compression, and only a 1-4 inch spark at 60 pounds. The heat of the spark depends entirely upon the watt energy consumed in the arc of the gap, or, in other words, the sum of the voltage multiplied by the amperage passing through and across the spark gap. But since the voltage across the spark gap becomes practically nothing after the resistance of the gap is broken down and the arc formed, the amperage then depends entirely upon the ohmic resistance of the secondary of the coil and the total energy induced in the secondary, and this energy again depends upon the mass and quality of iron in the primary, the ampere turns on the primary core, producing a certain total magnetic flux and the rapidity with which the primary current is interrupted, and from this analysis it would appear that the larger the iron core, or the larger the coil, the hotter the spark to be obtained. Quite true,

Figs. 1 and 2.—Showing method of closing magnetic circuit.

but we must figure on the frequency of the spark necessary to operate an engine at high speeds, and here we meet with a limitation in the size of spark coils practical for gas engines. We find that we have got to magnetize and demagnetize the primary iron core to produce an induced current in the secondary and as the iron core and its vibrator have a fixed time lag, depending upon the mass or iron in the core, the mass of the vibrator and the length and tension of the vibrator spring, we can therefore produce only a certain number of sparks per minute in a certain size coil, as a certain frequency is necessary for a definite engine speed. This frequency would then determine the size of the coil, and the size of the coil determines the total electrical energy which can be produced by it in the heat of the spark. With a magneto, however, we have no limitations, for, being practically a dynamo-electric generator, the larger we make the machine the more energy we can get in producing a longer spark and of greater amperage, and where a magneto is of the low-tension type, we have practically no lag, and could produce sparks far more rapidly than is necessary for present-day engine speeds. Magnetos which generate a low-tension current (mechanically interrupted) passing through the primary of a coil and stepping up the voltage by the secondary, have only the magnetic lag of the primary core and the armature core to contend with, and this arrangement would make possible far

*Paper read before the Society of Automobile Engineers at New York.

Fig. 3.—Details of spark coil and connections.

greater engine speeds than would be mechanically safe. So I will have to confess from my experience that a spark coil using a vibrator operated by either a battery, magneto, or small electrical generator will never produce the same results, or efficiency, produced by a magneto operating through a mechanical electrical make-and-break in the cylinder or on the magneto and stepping up the voltage for jump spark ignition through a non-vibrating induction coil.

Ingenious Instruments for Coil Testing.

In order to demonstrate more clearly the principles involved in spark coils, and the means of arriving at standard results of efficiency, I have designed several instruments for making absolute measurements for the purpose of testing the efficiency of various kinds of coils and secondary windings, comparing them with the results obtained with magnetos. Fig. 1 shows a primary iron core commonly employed in spark coils having wound consecutively upon it two layers of primary winding, through which pass the battery current, producing magnetic lines of force which pass through the iron core, and from one end of the core through space to the other end of core, so completing the magnetic circuit. Fig. 2 shows another form of primary core and winding having plates of iron on each side of core for the purpose of more thoroughly completing the magnetic circuit by iron to strengthen the magnetic field and to get a greater number of lines of force. And as the current induced in the secondary depends upon the strength of this magnetic field, the stronger we make it the longer the spark and the greater the amperage produced from it without consuming any more current. This form of construction is used in the Heinze type of coil.

In Fig. 3 we have the general arrangement of a spark coil; A is the iron core, B is the primary winding, C is the secondary winding which consists of some 20,000 turns, D is the condenser consisting of layers of tin-foil insulated from each other by layers or sheets of mica or paraffined paper, and which is connected across the vibrator at E and F, one end of the secondary winding being connected to the spark plug at G, completing its circuit after jumping the gap H in the plug, and passing to the ground connection formed by the cylinder to one end of the battery circuit I and through the battery to the primary winding to which the other end of the secondary is connected at J. When the primary current passes around the primary winding it magnetizes the iron core; this then attracts the small iron plate of the vibrator, and in so doing breaks the electric current at the contacts K and L and as the current ceases flowing around the iron core it quickly demagnetizes and this rapid decrease and increase of the intensity of the magnetic field is what causes a current to be induced in the secondary winding. The voltage or spark length produced by the secondary depends entirely on the number of turns of wire in series and the total magnetic flux and its rate of fluctuation from minimum to maximum in intensity. The condenser D is for the purpose of quickly absorbing the back rush of current from the primary at the moment of break and thereby eliminating the sparking at the contacts. Unless the condenser is properly proportioned in its relation to the primary winding, mass of iron and battery current, excessive sparking will be the result with

consequent pitting of the contacts. It therefore becomes apparent that every element, such as the microfarad capacity of the condenser and the magnetic qualities of the iron should be carefully tested and standardized in order to get uniform and efficient results. For the purpose of testing the magnetic quality of the iron and its ability to quickly magnetize and demagnetize I designed the instrument shown in Fig. 4, known as a *Hysteresis Tester*, which consists of an iron core, A, B, C, D, E, F, of U-shape. On the cores A, B, and E, F are wound small coils G and H, and between the pole-pieces I and J is mounted a small circular iron core. Around this core moves a small coil of wire pivotally mounted, to which is fixed an indicating needle L, moving over a graduated scale K. Small non-magnetic clock springs are secured to the coil pivot and keep the needle at zero. A direct current from a battery producing a certain number of milli-amperes passes through the moving coil on its pivot and through the coils G and H in series. The iron core M of the spark coils to be tested is revolvably mounted between the cores A and F and completes the magnetic circuit. If we now pass a certain number of milli-amperes through the coils G and H and the pivot coil, the iron core to be tested remaining stationary in the position shown in the diagram, we then get a certain deflection of the needle L over the dial K. If we now rotate the iron core M about its axis at a fixed number of revolutions we then get a new reading on the scale. The magnetism generated by the current in coils G and H and passing through the rotating iron core in the direction as indicated by the dotted line, reverses in direction through the rotating core twice during every revolution. If we now rotate this core 2,000 revolutions per minute we would get 4,000 reversals of magnetism. The number of degrees of deflection of the needle on the scale depends upon the strength of the magnetic field, and if the iron core does not readily demagnetize and magnetize during its revolutions it would naturally reduce the total strength of the magnetic field and the indicator would show a small reading on the scale. So by this method we can show absolutely whether an iron core is susceptible to rapid magnetic changes necessary

for producing a coil to give a great frequency of sparks per minute, and for the purpose of seeing that our iron is twice alike, for if it is not repeated, annealing will usually make it so.

To test the frequency of the sparks from a coil I designed the instruments shown in Fig. 5, which consists of a rotating needle A on its axis B, within a graduated ring C, of a known diameter and divisions. One end of the secondary D of the coil connects to the rotating needle A, and the other end of the secondary E connects to the ring C. The needle A, at its point F, is sep-

Fig. 4.—The Heinze hysteresis tester.

arated 1-4 inch from the ring C, so that sparks leap across this gap from the point F to the ring. If we now rotate the needle a certain number of revolutions and we have a certain circumference in the ring, by multiplying the number of the sparks per inch times the number of inches in the circumference of the ring, times the number of revolutions of the needle, we then get the number of sparks per minute. With this instrument we can easily test different makes of coils having various kind of vibrators, and can also learn the effect on the number of sparks produced per minute by varying the tension of the vibrator as well as determining the amount of current consumed, thus arriving at the best form of construction to give the greatest efficiency.

Fig. 6 is an instrument for measuring the approximate temperature of the spark of different spark coils and magnetos.

Fig. 5.—Heinze instrument for testing frequency of sparking.

This is not determined in Fahrenheit degrees, but in heat units. The instrument is designed on the principle of utilizing the expansive effect of a hot wire to move an indicator needle over a graduated dial, and is constructed as follows: A fine copper wire is stretched between the metal contact posts, A and B, the tension of this wire being regulated by the adjusting screws K and K'. To the center of the wire at C is fastened a small copper stud, which comes to within 1-32 inch of the metal plate D. The secondary terminals of the spark-coil are connected to the binding posts L and M, completing its electrical circuit through the copper wire N, across the gap at C, to plate D. If a certain amount of primary current, determined by an accurate ammeter, is passed through the coil, we will get a continuous secondary spark between the stud C and the plate D. This spark heats the stud and in turn heats the copper wire which expands and causes an elongation in the direction of the arrow E. To the center of the wire and the stud C is also fastened a small wire, to the end of which is fastened a silk thread, wound around a pivot and kept taut by a small spring H. To the pivot is fastened an indicator needle moving over a dial I in the direction of the arrow G, when the wire is expanding, and in the opposite direction when contracting, giving us a certain reading depending entirely upon the temperature produced in the copper wire by the heat of the spark at the gap C. When the rate of cooling, or radiation, of the wire equals the production of heat from the secondary current, the needle will then come to a stop and no fixed time measurement is necessary. In order to test various coils, it is first necessary to see that they all consume the same amount of primary current at the same voltage. When comparing the spark from a magneto with a coil, I found that the magneto produced from 500 to 1,000 per cent. more heat units in the spark gap of the plug, over a coil, so the importance of having an instrument making absolute measurements possible, thereby eliminating the personal factor, may be appreciated.

Fig. 7 is an instrument for measuring the amount of lag in the secondary spark from the moment the primary current is closed, and my object in designing this instrument was to clear up a prevailing idea in the minds of many automobile operators that by advancing the timer an early ignition is produced when

the piston is still coming up. From the many experiments which I made in ignition timing, I found that it was impossible to advance the spark more than 10 degrees at an engine speed of 1,000 r.p.m without observing a slight decrease in power; if the advance was carried further, the engine would gradually come to a stop, or kick back. The higher the engine speed the more the spark can be advanced, but no such advance is possible as would be indicated by the position of a timer apparently capable

Fig. 6.—Heinze hot wire pyrometer.

of a movement of 90 degrees, or more. This great amount of advance of the timer is necessary to overcome the enormous lag in vibrating spark-coils, but no such advance is possible with a magneto, for the secondary spark takes place immediately at the moment of the primary current interruption. The only lag present is entirely magnetic, and there is none in the contact, for the mechanically-operated contact breaker in a magneto increases in speed with the engine, but the vibrator of a coil has a fixed lag, or in other words takes just as long to start vibrating,
(Continued on page 379.)

REMARKABLE WORK OF BACKWOODS INVENTOR

By VICTOR LOUGHEED.

IT has not often been the case that any considerable progress in automobile design has come from small and isolated communities, as the result of independent individual effort, but to all rules there are exceptions. Though the automobile has been chiefly regarded and is for the most part a product of the cities and more populous areas of civilization, it is none the less a fact that in the development of a mechanism having all terra firma for its field of usefulness there may be much of merit in the ideas of the man who, spurred by a knowledge of exceptionally demanding local conditions, brings out something specially adapted to cope with them. Such has been the genesis of the really remarkable automobile truck illustrated herewith, which, besides being a demonstrated success, is exceptionally noteworthy in having been entirely designed and constructed by a country blacksmith, Arthur Mills, of Ione, Cal.—a small mining town almost as remote in point of accessibility from the populous

Blacksmith Arthur Mills' Ore-laden Automobile Train.

sections of the Pacific slope as it is from the motor building centers of the East.

Over fourteen years ago, it has developed, Mr. Mills first commenced pondering over the problem of mechanically-propelled vehicles for common roads, and almost as soon commenced the work that has eventually embodied his ideas in useful form. This period of work, carried on absolutely without more than local publicity, and without the sale of a machine—none having been placed on the market even yet—is worthy of note in that it classes Mr. Mills with the very pioneers of American automobile manufacture, with perhaps especial credit due because all that he has accomplished has been done in spite of the handicap entailed by a lack of facilities for the interchange of ideas with other workers in the same field.

Mr. Mills' work has been from the first consistently in the commercial vehicle field, a keen recognition of the fact only recently discovered by many others that in the last analysis the importance of the automobile must rest, not upon passing fads or fancies, but upon solid worth and utility. And, more even than this, it is to be said for Mr. Mills that he has achieved as successful a design, by strictly following his own ideas and methods, as many others have with the aid of all that a growing standardization and uniformity of practice could afford, for it is only within a very recent period indeed that the makers of trucks and commercial wagons generally have been able to supply machines really satisfactory from the customer's standpoint.

The first Mills truck is the one illustrated herewith, it being a 4,500-pound machine, capable of carrying a load of 3,300 pounds over the worst roads and hardest gradients, while at the

same time touring a heavy trailer with a 6,500-pound load. This machine was completed several years ago and was in more or less regular service until very recently, when it was torn down that some of its parts might be used in the model that followed it. As is suggested by the illustrations, anything from hay to ore can be hauled, these being the usual loads transported in the particular class of mountain service to which its activities have been confined. No great speed is attempted, the roads around Ione, Plymouth (where the truck was built) and other points in Amador county being of a character to discourage speed, even when the power for it is available. Both in the matter of heartbreaking hills and atrocious surfaces—deep sand and mud, broken rocks and boulders, and excessive grades—there probably are none worse in the country than these primitive highways of California's earliest mining district. Yet with only six horsepower, though of course at low speed, this original Mills truck time and again, month in and month out, proved its ability to go and keep going with heavy loads without ever becoming stalled. Trips to Sacramento and even to San Francisco, on occasion, proved a capacity for long distance travel.

In mechanical detail the features of principal interest probably are the enormous wheels, shod with regulation steel tires—except for the use of small knobs at intervals on the driving wheels to help traction, the wide tread, and the peculiar arrangement of the power plant. The wheels are 58 inches, the tread 62 inches, and the wheelbase 174 inches, making the machine about 20 feet long over all.

The motor was a 6-horsepower, two-cylinder, vertical, four-cycle engine, located crosswise under the front seat and presenting no unusual features—both valves being mechanically operated, the cooling being by water, ignition by jump spark, etc. Speed changing was by a novel individual clutch system, with double bevel gears, affording two speeds forward and reverse. From the change-speed gear the drive was by single chain to the solid countershaft, the spur pinions on the ends of which drove directly into internal gears bolted on the insides of the rear wheels. No differential was used, releasing clutches between the internal gear rings and the wheels providing for automatic disengagement of one wheel by an inter-connection with the steering gear.

The steering gear is of the fifth-wheel pattern, controlled by a sector and pinion, the latter on the base of a vertical steering wheel. The reduction is so very great as to make irreversibility unnecessary and the fifth-wheel construction unobjectionable, it being remembered that the speed is very low.

Seven miles on a gallon of gasoline was the fuel consumption. Forty-five gallons were carried.

A new truck, containing parts of the old, has just been completed. It weighs 6,500 pounds and can carry five tons, besides drawing a trailer carrying five tons. The motor is a 14-horsepower of the same type as the first and the transmission is similar. The wheels are 48 inches front and 50 inches rear, the tread 62 inches and the wheelbase 150 inches. Thirty-five gallons of water are carried in a dummy bonnet, under which the gasoline tank also is located, and serves for cooling without any more radiating surface than is afforded by a few lengths of ordinary half-inch piping. A Schebler carbureter is used, and muffler cut-out is provided. Five miles per gallon is fuel use.

Throughout the vehicle a special point is made of the entire lack of special steels and materials. It is thus possible to effect repairs in any blacksmith's or wheelwright's shop, just as the entire machine has been hand built by Mr. Mills with the meagerest facilities. Despite this lack of alloy steels and the like, it is to be noted that the weight of the vehicle is not in excess of that of others of similar capacity.

LETTERS INTERESTING AND INSTRUCTIVE

WHAT IS THE AUTO'S FACTOR OF SAFETY?

Editor THE AUTOMOBILE:

[1,213.]—As I am considerably interested in the design of automobiles, I would be pleased if you would inform me what factor of safety is used in proportioning the different parts, such as side frames, driving shafts, transmission gears, and axles. I have been informed that the factor of safety depended upon the difference between the elastic limit and the ultimate tensile strength, but I do not know to what extent, and have no specific data for determining this, and have been unable to find any books containing such, so I would be pleased if you could help me out. Vanadium steel is what I was thinking of most especially.

Does "The Automobile Pocketbook," by E. W. Roberts, contain any such information as I have asked for?

Blson, Okla.

F. M. VANDERVOORT.

It would be impossible to state definitely exactly what factor of safety is generally allowed in the design of automobile parts, as this is something that naturally varies with each designer, but generally speaking, it may be said that it is very high; the maximum permissible consistent with keeping the weight within proper limits. In spite of this limiting factor, it is probably safe to say that the factor of safety of the automobile, as a whole, is very much higher than almost any other piece of machinery marketed generally, owing to the excellence of the materials employed. We have never heard of the factor of safety being made dependent upon the variation in the characteristics of the material, such as you state. In calculating the factor of safety in any given case, the maximum safe ordinary working load is taken as a basis, and the strength of the parts increased to make as great a margin of safety as is deemed to be necessary in view of the nature of the load to which the structure is to be subjected.

While Roberts does not make special reference to this subject under a separate heading, we think you will find it mentioned from time to time in connection with the design of various parts in "The Automobile Pocketbook." For instance, in connection with automobile chains, he says: "It is very seldom that an engine will develop its full power when the car is running on low gear, and a factor of safety of five will be found quite customary practice when calculating the strength of the chain on this basis. So a chain having an ultimate tensile strength of 5,000 pounds should not be subjected, under working conditions, to a strain of over 1,000 pounds."

BEST ROUTE, SPRINGFIELD TO ALBANY.

Editor THE AUTOMOBILE:

[1,214.]—A party intending to make a trip to New York State this summer desires information as to the best route between Springfield, Mass., and Albany. Can you or any of the readers of this magazine who have been over the several routes give any light on the subject? How long can an owner of a Connecticut car tour about New York State without getting his car registered in that State?

Putnam, Conn.

ROBERT E. HARRIS.

At the present time the direct route between Pittsfield and Albany via the Lebanon, Brainard and Nassau is closed by order of the State Engineer, in connection with the considerable improvements and reconstruction of the line, and there is no knowing when this route will be open to travel again. For this reason, it is necessary either to push through the improvements in process, or make a detour from some point south of Pittsfield (usually Stockbridge) to State line; thence west through Chatham and Valatie, meeting the Poughkeepsie-Albany line about twenty miles below Albany. Maps of both the regular route and this special route will appear in the New England edition of "The Official Automobile Blue Book for 1908." Under the present law any automobile may remain indefinitely in New York State provided it is equipped with a regularly issued license from any other State.

POINTERS FOR A PROSPECTIVE PURCHASER.

Editor THE AUTOMOBILE:

[1,215.]—Will you kindly give me your private opinion as to (1) whether a two-cycle, double opposed motor, shaft drive, placed under the hood in the front of the chassis, is as serviceable; i.e., will it have the motive power for heavy roads, such as for mud, hill climbing, etc., as when the weight of motor is placed under the hind axle? (2) Is a 15-16-horsepower outfit better than an 8-10-horsepower for general use in the country for poor roads, hill climbing, etc.? (3) Would it be feasible to use a set of steel tread wheels for muddy and poor roads; i.e., will they give the resistance necessary for practicability, and would it cause too much jarring for the motor? Or would it be better to have solid tires?

My idea was to get a motor and use two sets of wheels; one set with steel tires and the other pneumatic, for use when the roads are fine. (4) What is the best height and width of tire for the wheels for use (hills and mud) as stated in the former query? (5) Is an air cooled machine of given horsepower just as serviceable and practicable as the water cooled, or has it disadvantages?

Contemplating purchasing an auto, these are a few points on which I wish some light before investing. J. C. HUBENTHAL.

Belmont, Wis.

1. This will depend upon the design. If the latter be such that a sufficient proportion of the load comes over the rear wheels, the motor forward will be serviceable and probably more convenient than when placed in the rear. Putting the motor over the rear axle and designing the car so as to carry most of the weight of the load there, would give poor balance.

2. The larger motor would naturally be more desirable for poor roads and hill-climbing, as these present conditions under which the maximum power, consistent with light weight, is an essential.

3. Steel tires would not be practical, whether on good or bad roads, as they would not give the desired amount of traction, and they would subject the motor to excessive pounding, except at very low speeds. Solid rubber tires would naturally be preferable. The idea of using steel-tired wheels in fair weather and pneumatics in stormy weather is hardly feasible, unless you intend to carry both sets with you at all times and get out and change whenever necessary.

4. This would depend upon the weight of the car, and if the latter were not great, a two or three-inch tire on a 42 or 44-inch wheel would be advisable, particularly for mud.

5. This is largely a matter of personal opinion. In some cases the air-cooled motor has been found superior.

WHAT IS WRONG WITH THIS CARBURETER?

Editor THE AUTOMOBILE:

[1,216.]—I would like to ask you about the setting of the carbureter on our Pierce Great Arrow car, 28-32 horsepower, 1906 Model, which is the special carbureter used on most of that date Pierce cars. During the past year we have averaged five to six miles on a gallon of gasoline. But lately have raled and lowered the float and changed the opening of needle valve, with no better results. Can you suggest how I can get more miles to the gallon with the present carbureter? Some suggest setting the float so the gasoline will raise 1-32 inch below the spray nozzle. Do you think that right, or would you set the float higher? And what position should the spark and throttle level be in to test the carbureter while car is standing still? Inclosed find drawing of the carbureter. Do you think some other make of carbureter would do better on this car?

Ithaca, N. Y.

W. J. WILSON.

The level of the gasoline should be 1-16 inch below that of the opening of the nozzle. It is customary to test a carbureter by closing the nozzle to a point where just enough gasoline is vaporized to run the motor without missing at its slowest speed, the spark advance lever being placed at the usual starting point. This is done by starting the motor and gradually closing the needle valve until the motor will no longer run without missing. It is then opened slightly again until the missing disappears, and made fast at that point. The needle must be turned very little at a time. The motor

is then speeded up and the auxiliary air intake of the carbureter adjusted to give the best results. Just what opening there should be for the different speeds may be learned by closing the opening, either with an improvised disc, that may be opened or closed as desired, or by placing the hand over the outlet and allowing more or less air to enter, according to the action of the motor at the different speeds.

The mileage you have been averaging is very low and may not be the fault of the carbureter altogether. Probably not at all, as there may be considerable loss of compression round either the pistons, or through the valves, which would account for the excessive amount of fuel required to do the same work. We should not recommend changing the car-

Section of 1906 Model Pierce Great Arrow Carbureter.

bureter without investigating the cause of the lost power more thoroughly and think an appeal to the makers of the car for information would be the wisest step to take, before making any radical changes of this nature. The makers of the Pierce cars have changed the design of their carbureter considerably since the type shown was made, by making the float chamber concentric with the nozzle and by making changes in the air-valve mechanism.

HOW MANY CANDLEPOWER ARE REQUIRED?

Editor THE AUTOMOBILE:

[1,217.]—Please answer these questions in the next issue of "The Automobile." How many candlepower would a light have to have to give same amount of light as is given from a 7-inch searchlight? Lamp to be 6-volt, and is to be put in place of burner in searchlight.

I have a Ford runabout with a Kingston carbureter on. I can adjust this carbureter so machine will run fine for perhaps ten miles or maybe it will only run a short distance. All at once engine will slow down and just run, but if I change the needle valve sometimes one way and sometimes the other, it will run fine again for a way. Tanks and pipes are clean, so is carbureter. All connections are tight and valves do not leak. A friend of mine has same trouble. If you can help us out, we will appreciate it very much. We are both subscribers to your paper.

Oregon, Ill.

F. R. ZIEGLER.

It is impossible to answer your question from the data you give, as the candlepower required does not depend upon the size of the searchlight as much as it does upon the size of the burner employed. Generally speaking, however, it will not be possible to obtain the same efficiency with a searchlight designed for acetylene, as the light of the latter is concentrated in a very small area, whereas the filament of the average incandescent electric lamp occupies a comparatively greater amount of space. This is a query which we

prefer to put up to the experts employed by the lamp manufacturers, who will doubtless come to your aid in this column.

From your statement of the carbureter trouble, it seems apparent that when you have the needle properly adjusted you do not fasten it in place and the jolting consequent upon running the car causes it to loosen up. Once the needle is set for regular running, and this should be at a point where the motor is just getting gasoline enough to run at its minimum speed without missing, the locknut should be tightened, so as to hold the needle permanently at that adjustment. It may be that the threads have worn.

A PECULIAR FORM OF MOTOR TROUBLE.

Editor THE AUTOMOBILE:

[1,218.]—I drive a Premier "24" car, and am frequently annoyed and delayed by the actions of the carbureter, which is of the Schebler make. At times when I want to crank up, the carbureter belches gasoline out of the air intake, and I can do nothing to stop it. I simply have to crank and crank until the carbureter quits doing it. Sometimes I am delayed as long as an hour at a time. My motor runs along excellently, and when I stop there is no indication of trouble, but when I want to start up again, nine times out of ten it is all right. The other time, though, I am up against this trouble. This is in summer and winter alike, so I don't believe that it is produced by the condition of the weather. The valves are in excellent condition, so it cannot be because of them. Whenever this trouble arises, investigation shows that the needle valve is not sticking, nor are there evidences of any kindred troubles. I wish you would give me your opinion on this subject, through the columns of your paper, as I have exhausted my own resources, as well as those of all the garage men I know.

Chicago, Ill.

L. M. G.

It is evident that the only thing which can cause such action is the escape of compression from one or more of the cylinders through the air intake of the carbureter. Where does this compression come from? Granted that a carbureter is a mysterious device to the average autoist, and to many an otherwise skilled repairman as well, still it is not capable of producing compressed air or gas of its own accord. This compression must come from one of the cylinders; the only means by which it can find its way into the manifold is through a defective valve, and once in the manifold, the only way of escape is through the carbureter. If you are quite certain that the assumption that the valves are all right is sound, then there is a mystery to be explained, but we think you will find that a closer examination of the valves will destroy the assumption. Their seatings may be in good condition, but a stray piece of carbon, a weakened valve spring or some similar cause may prevent one of the valves from seating properly at times, and the spasmodically recurring nature of the trouble would indicate that it is only by chance that this condition is brought about. The escape of compression prevents any fuel from entering the cylinders, and naturally the motor cannot be started until it has been turned over long enough to dislodge the cause, whatever the latter may be. It is an injustice to the carbureter to attribute the trouble to it, and we think you will find a closer examination of the valves and their operating mechanism will reveal the cause. If any of our subscribers have a theory of their own in the matter we will be pleased to hear from them.

"THAWING" OUT A MOTOR IN SPRING.

Editor THE AUTOMOBILE:

[1,219.]—Will you please tell me how to thaw out a gas engine before spring? It is a 3 1-2 horsepower Palmer engine in a small launch, and as the boat is pulled up for the winter, I would like to try the engine before letting it down in the spring. Kindly inform me through the columns of "The Automobile." L. D. F.

Andover, Mass.

"Thawing" is rather a peculiar way to put it, unless you have neglected to drain the water-jacket before laying the boat up for the winter. Even in such a case it will not need any thawing by the time you get around to it in the spring, but will doubtless need a little more serious consideration. Prob-

ably you intend an "overhauling" or "limbering up." This may consist of anything from a mere cleaning to a total dismantling of the motor. If you only wish to do the former, flush out all the bearings thoroughly with gasoline, including the piston, see that the gasoline tank and piping and the carbureter, as well as the whole ignition system, are in good order and everything is clean. Provide fresh cells for the ignition battery, and after the gasoline used in the cleaning process has all evaporated from the interior apply fresh lubricating oil and the motor is ready to start.

SHOULD REAR-WHEEL FASTENINGS BE RIGID?

Editor THE AUTOMOBILE:

[1,220.]—In the method of fastening the rear wheels upon their axles, as described, it is impossible to entirely obviate some play between the axle and hubs by most careful adjustment of keys and pins. Is this looseness undesirable, and will it work ultimate injury to the car? The play is not in the direction of the wheel motion; i.e., tendency to shear off the key, but is noticeable when the wheel is grasped at two opposite points of the tire, and a to-and-fro motion in the direction of the axis of the axle applied.

The construction is as follows: Axle, cylindrical; no taper; a hub with a key-way its full length, but other portions being a sort of web, so that it bears upon the axle at its center and at both ends for a distance in each instance of about 3-4 inch. Near the outer end of the hub is a hole with a corresponding hole in the axle, through which a pin is driven.

As I am anxious to keep my car in the best of condition, your opinion on the above will be much appreciated.

Alameda, Cal. MAURICE W. BROWN.

This slight amount of side play in a rear wheel is not an element of danger. Unless it be excessive, it is rather a factor of safety than otherwise. If the wheel were rigidly held laterally, it could not be turned easily and the friction would be tremendously increased.

SOME PRODUCTS OF AN INVENTIVE GENIUS.

Editor THE AUTOMOBILE:

[1,221.]—I have invented a device to put on an auto crank to release the engine when it kicks. I have also an idea which will roll a clincher tire off a rim as fast as those that are now made and can be made for one-quarter the cost of those on the market. I have a few more ideas, and I think it will pay you to investigate, and I am not afraid to show them. I am twenty-two years of age, and would like to get these on the market, as I think there is lots of money in them.

Chicago, Ill. H. L. SKOLINK.

You evidently have been making a close study of the various parts of the automobile that are in need of improvement. We are always interested in learning of such devices, and in publishing them where their merit is such as to warrant it. Further than this, we cannot help you to market them, and would recommend your writing to manufacturers who make a specialty of this. You will find the announcements of a number of them in our advertising columns. The large tire manufacturers are always keenly interested in anything that will be an improvement over present methods.

CONCERNING VALVES IN THE HEAD.

Editor THE AUTOMOBILE:

[1,222.]—Will you kindly publish the names of four-cycle cars now using valves in the head? Can you give me the number of years each of the cars have used this system? Can you give me the name of any four-cycle car which formerly used valves in the head but has now given up the practice?

Cedar Rapids, Ia. SUBSCRIBER.

The Matheson, Moon, Pope-Toledo, Pope-Hartford, Dorris, Mitchell, Franklin, Jackson, Knox, Marmon, Frayer-Miller, Stoddard-Dayton and probably several others, as the foregoing only happen to constitute a list of those easily recalled to mind at the moment. Some motor manufacturers, such as the makers of the Northway and others, also employ this design. The first six cars in the list have had motors of this type for three or four years, in some cases longer, and this is also true of the Knox, Marmon, Franklin and

Frayer-Miller. In the majority of the foregoing instances, the motors have never been equipped with any other type. We can not recall an instance in which this design has ever been abandoned.

VOLTAGE AND AMPERAGE OF IGNITION CURRENT.

Editor THE AUTOMOBILE:

[1,223.]—I am a constant reader of your "Letters Interesting and Instructive." Will you please tell me, through your columns, the voltage and amperage of the secondary wires of a Spiltdorf spark coil when run by four dry cells? I mean the current that makes the spark.

Fishkill-on-Hudson, N. Y.

Under favorable running conditions, vibrator coils require a fraction of an ampere for their operation, say .75, while four dry cells will have a voltage of six when new and connected in series. The current and voltage of the secondary current will then depend entirely upon the number of turns in the primary and secondary windings of the induction coil which transforms it, or "steps it up" to the high voltage. In letter 1,179, issue of THE AUTOMOBILE of February 20 last, Frederick C. Hathaway goes into this subject more in detail and we would refer you to his letter, which will be found on page 249 of the number in question.

WHICH GEAR SHALL I BUY?

Editor THE AUTOMOBILE:

[1,224.]—Would you kindly advise me what transmission you would recommend for a 16-horsepower opposed motor engine? I wish the planetary type. There is such a difference in price that I can hardly tell what to buy. The New York can be bought for \$37 and the Syracuse Gear Company asks \$60 for the same power size.

Pringhar, Ia. JOS. REYNOLDSON.

We are in no better position in this respect than you are. Doubtless the maker of the more expensive gear has good reasons for asking a higher price, and will be glad to inform you what they are upon application. You will find that there is quite a difference in quotations on any kind of machinery where made by a number of different manufacturers. It all depends upon the design, material, workmanship, conditions under which it is produced and the like. It is a matter that you will have to decide for yourself, after carefully weighing all the claims one way or the other.

ABOUT KEROSENE vs. DECARBONIZING FLUIDS.

Editor THE AUTOMOBILE:

[1,225.]—Will you kindly inform me, under the head of "Letters Interesting and Instructive," whether the various decarbonizing fluids and mixtures advertised so freely contain ingredients that are injurious to the engine? Also are these patent preparations any better in the long run than simple old-fashioned kerosene?

Walden, N. Y. CARBON.

Never having analyzed any of the preparations in question, nor having come across a published analysis of their ingredients, we are at a loss to state whether they might be injurious to the cylinder walls or not, but, on general principles, would be inclined to assume that they were safe to use. We do not know that there is anything better than kerosene.

USING LARGER TIRES THAN RIMS CALL FOR.

Editor THE AUTOMOBILE:

[1,226.]—Is it advisable to use 4-inch tires on 3 1/2-inch rims? Also, in adjusting a loose connecting rod, should it be made to work a little stiff?

Batavia, N. Y. L. L. MULCAHY.

We have known of this expedient being adopted, but never had an opportunity of learning what the outcome was after an extended period of use. On general principles, should not think it to be advisable for several reasons, chief among which would be the difficulty of putting the tire on the rim, the danger of pinching the tube in the process, and more than either of these, the risk of rim-cutting. In adjusting any bearing, it should be made slightly loose, rather

than stiff; that is, just sufficient play to permit the shaft to turn easily, but not enough to make it noticeably loose. Even a slight amount of stiffness in the adjustment of each connecting rod bearing would make it next to impossible to turn the motor over by hand, from which it will be evident that a great amount of resistance would be imposed on the motor when running and until the bearings had been worn down so as to allow for a little play, it could not develop its full power.

HOW TO READ A "COMPRESSION CHART."

Editor THE AUTOMOBILE:

[1,227.]—Please tell me, through "Letters Interesting and Instructive," how to read a compression chart. APPRENTICE, Parsons, Kan.

It is not quite clear to us what you intend by a "compression chart." If you mean a table of compression pressures it will naturally depend upon the arrangement of the latter and the manner of reading it will be self-evident. Probably you mean an indicator card, and if this be the case we would refer you to an article entitled "The Indicator Diagram and What It Means," by Victor Loughheed, which appeared in THE AUTOMOBILE of January 2.

NO TROLLEY FROM NEW YORK TO BRIARCLIFF.

Editor THE AUTOMOBILE:

[1,228.]—Will you kindly supply the following information in "Letters Interesting and Instructive?" Is there a trolley connection between New York and the Briarcliff race course? If so, will you kindly state the route and fares? SUBSCRIBER, Freeport, N. Y.

There is no trolley connection between New York City and the course of the Briarcliff Trophy race. It may be reached by taking the Harlem road to Briarcliff Manor, or the Central to Ossining. The Briarcliff course is peculiarly off direct transportation lines, though it can be reached from other points than New York. A good map would help.

THE PRACTICAL SIDE OF THE QUESTION.

Editor THE AUTOMOBILE:

[1,229.]—When an automobile weighing 2,000 pounds descends a 25 per cent. grade it is propelled by the force of gravity equal to one-fourth its weight, plus the propelling force of its motor. The retarding forces which must be overcome are total friction, air resistance, and the resistances to be overcome before the motor can deliver propelling power. These motor resistances consist of compression, scavenging, and the momentum of the piston and connecting rod at each end of its travel. Of these resistances, friction decreases as the speed increases, while the other three increase with the speed. If the motor is turned by force applied to the drive wheels, these resistances remain constant just the same as if the explosions overcame them, but the power to overcome the resistances must be taken from the gravity force which I have mentioned, instead of the motor power, and this leaves just that much less gravity force to propel the car down the grade. The faster the drive wheels turn the motor, the greater will be the resistance to be overcome, and the slower the car will move. Therefore, if we wish to use the motor as a retarder to car movement, we will get the greatest service by using high gear, with the spark and gas supply cut out. There should be plenty of air taken into the cylinders in place of the gas to secure the compression resistance to its fullest extent. Taking in gas does not differ in its results from taking in air, if the throttle be opened to its full extent. Therefore, to coast down hill using the motor as a retarder, we should have a convenient circuit-breaker and use the speed gear that gives the required resistance, high for steep hills, and intermediate or low for hills of less grade. The speed gear should not be thrown in after the car has added momentum to its propelling force as a means of bringing the car to an emergency standstill, except to avert very serious disaster, and then the act is very likely to produce a break which will release all control and lead to the very result that is so important to avoid. Under stress of this condition, first put on your hub brakes, turning them out by fierce friction if need be, then throw in slow gear to assist the other brakes. You may have some hub brakes to replace, but you will not go to smash by complete loss of control.

There are some automatic safety additions to the present automobile which it seems to me must come into use soon: The differential, which does not act as such until the front wheels are turned

from straightaway a definite distance; the use of a spring to keep the guide wheels straightaway until deviated by the operator's action, and then if the hand leaves the guide wheel they will return to straightaway; a convenient current cut-out which can be operated in an instant to shut off motor force.

Marshall, Minn.

A. D. HARD, M.E.

DETAILS OF A STEEL-TIRED STEAMER.

Editor THE AUTOMOBILE:

[1,230.]—I am building a steam auto with my patent boiler, known as the Hazelton holler. My boiler is upright, 20 inches diameter, 42 inches high. It sets either in front of the axle or behind the rear axle. The center column is 10 inches diameter, the tubes 1 by 5 inches, 600 of them. The tubes are horizontal. The water is in the tubes. Depth of water in the holler, 2 feet. My first boiler, made twenty years ago, with ten others, sets at the foot of Thirteenth street, East River, in the New York Mutual Gas Light Co.'s works. The White steam boiler has 5,000 square inches of heating surface; my holler has over 10,000 square inches of heating surface, and holds 100 pounds of water. I can carry 250 pounds pressure if necessary. Engines are the Mason type, made in Boston, cylinders 3 by 4 inches; wheels are 4 inches diameter, steel tires of 2-2 inches face. Front axle is a Timken roller bearing axle. My drive axle 1.5-8 inches diameter, with sleeves and four brass hox bearings. Both wheels keyed on the same axle, with one sprocket and one brake. No differential gear in the center of axle. Axles are connected with reaches made of 2-2 inch angle iron. I set four full elliptic springs 44 inches long with the two bed plates bent near the ends, so they will touch near the ends before they touch in the center. This will take all jar. Body is a regular two seated carriage type, set on the springs. Wheels being 40 inches high, give plenty of space to hang boiler 24 inches below the floor line. Engines are under the floor, midway between the two axles, in a tight box, to keep dust from the chain drive. Wheelbase, 9 feet; total weight, about 1,800 pounds. The two seats are far enough apart to set two stools between them. Steel tires have been used since old King Solomon's day, and I am going to try and use them on a steam auto. They will not puncture, and will last at least ten years, and can be replaced with a new set for \$10. Locomotives and all cars have no differentials, and they go around corners nicely. The elevated roads in your city turn very short corners without any trouble, and my auto with smooth tires will go around corners without any trouble. The inside wheels on the cars and my auto must twist on the track and ground. My object in building this is to bring out a cheap auto. With this boiler I can use hard coal successfully or kerosene oil. I can run one hundred miles with one hundred pounds of coal. One pound of coal in my boiler will evaporate twelve pounds of water; one pound of kerosene will evaporate twenty-five pounds of water, and will cost four times the cost of coal. M. W. HAZELTON, Oneonta, N. Y.

A FURTHER PHASE OF GYROSCOPIC ACTION.

Editor THE AUTOMOBILE:

[1,231.]—E. F. McNutt's article on gyroscopic force appearing on page 245 of "The Automobile" of February 20, calls attention to a surprising lack of judgment on the part of holders of racing cars. His statements are correct, but he overlooks one important feature which would add strength to the argument that either racing motors or race courses should be run in the opposite direction: A motor whose flywheel revolves toward the left side of the chassis produces a resultant torque tending to turn the entire chassis over in the opposite direction. This force acts in the same direction as those mentioned by Mr. McNutt, and adds to the danger of upsetting when turning to the left.

The writer would recommend changing the motors rather than the race courses, as drivers have become accustomed to turning to the left, and, as a rule, would prefer not to change, while it is as easy to make a motor run one way as the other. The ideal motor for racing purposes is one revolving in a horizontal plane (Adams-Farwell fashion). The gyroscopic force exerted by such a motor does not offer the least resistance to turning the car to either right or left, but it does exert a powerful force counteracting any tendency of the car to upset.

The resultant torque of the motor revolving in a horizontal plane does not affect the stability of the car in any way. When a gyroscope representing 4 per cent. of the total weight of a passenger car makes it possible to run on one rail, as has been done recently in England, a light racing chassis with one or two heavy motors revolving around vertical shafts certainly could take a curve at much higher speed than would be safe with other machines. The speeds of racing cars have increased in the past few years, and it is now time for those interested to consider such questions as this, which not only make higher speeds possible, but reduce the danger.

Duquesne, Ia.

GLEN MUFFLY.

FEATURES OF RENAULT SIX-CYLINDER CHASSIS

THOUGH Louis Renault and the engineers associated with him in the production of the much-admired models of the Billancourt factory have never been enthusiastic public supporters of the six-cylinder principle, and have had sufficient success with "fours" to be satisfied with that type of engine, Renault Frères are producing a six-cylinder car for

engine, like all other models, are fitted with four rings, three on the upper part and one on the lower, this latter being designed to clear the cylinder walls of any excess of oil. It is an arrangement which has been adopted for several years to prevent the passage of oil above the cylinder heads and the consequent fouling of plugs and valves. A single cam-

shaft, machined out of the solid, operates both inlet and exhaust valves on the left-hand side of the engine. To facilitate the starting of such a large engine a half compression lever, operated by a double cam has been fitted.

The arrangement of intake, exhaust and water piping, always a complicated matter on a six-cylinder engine, has been rendered more difficult on the Renault by the addition of a self-starter. A glance at the illustrations of the engine, however, shows a remarkable accessibility, and a detailed examination reveals such a disposition of the various organs as to ensure the dismantling of any part with the least amount of labor. Inlet and water piping is identical with that of the smaller engines; the use of thermo-syphon circulation, besides enabling the pump to be discarded, bringing about a simplification of piping. The efficiency of the thermo-

mo-syphon for a large engine has been amply proved by the performance of the 1906 and 1907 racers. In this connection it is interesting to recall that in 1905, when Renault experimented with force feed water circulation, all three racing cars overheated. For the first time the grilled tubes have been abandoned on all models in favor of plain vertical copper tubes connected to upper and lower receivers. This multitubular radiator was used for the first time last year

Valve Mechanism on Renault Clean-cut Accessible Six-cylinder Engine.

1908. Larger and more powerful than any of the four-cylinder models, with a wheel base of 156 inches, it forms the highest type of long-distance open or closed touring car, and is declared to be capable of a speed of 70 miles an hour with seven passengers on board.

Though an entirely new model, differing from all others in power and size, the 50-60-horsepower six-cylinder Renault is but a development of the smaller cars. Indeed, throughout the entire series, from two-cylinder taxicabs to six-cylinder touring cars, there is a remarkable uniformity of design; even the powerful racing cars of the last two or three seasons being but enlarged touring cars, differing naturally in detail, but identical in general design.

Even the engine, though composed of six cylinders instead of four, has an appearance which is thoroughly familiar to those acquainted with the other Renault models. As in the fours, the cylinders are cast in pairs, the bore and stroke being $4\frac{3}{4}$ inches by $5\frac{3}{4}$ inches. Normally, the engine speed is 1,400 revolutions a minute, but can be accelerated much higher without any danger of undue wear to the connecting rods and main bearings. It is hardly necessary to say that the horsepower rating is a most conservative French one.

The pistons of the six-cylinder

Carburetor Side of Engine, Showing Magneto and Self-starter.

Compact Gear Set, Clutch and Fanwheel Fan.

on certain models and all racers, and gave such satisfactory results that it has been adopted exclusively. Among other advantages is the saving of weight through discarding the metal fins. On the periphery of the flywheel, just to the rear of the radiator is a sheet steel fan by which a strong current of air is always assured. One of the small refinements of this simplified cooling arrangement is the method in which the radiator is mounted on the dashboard. When the inlet and outlet pipes have been disconnected all that is necessary to dismount the radiator is the release of one nut on each side of the chassis. At the base of the radiator is a short swinging arm slotting into a bracket on the frame and held by a single nut. It is the release of this nut which allows the withdrawal of the arm and the dismounting of the radiator.

For the six-cylinder engine, the Renault automatic carbureter, with some detail refinements over previous models, is employed. It will be noted that the carbureter and the intake are at opposite sides of the engine, the inlet pipe being carried over the head of the central pair of cylinders to a mixing chamber at the opposite side, in which the gas supply is regulated. The sparking point being fixed, engine control reduces itself to the simple operation of one lever under the steering wheel, or the use of the foot accelerator.

How Ignition System Has Been Simplified.

Renault engineers have long been of the opinion that one reliable ignition system, with current supplied by a high-tension magneto, was all that is necessary, and that storage batteries as a stand-by were superfluous. Thus, on the six-cylinder model, there is a Bosch high-tension magneto and one set of spark plugs immediately over the inlet valves.

Rear Axle and Three-quarter Elliptic Springs.

The magneto, considerably smaller than those of previous years, is carried on the forward end of the engine, its revolving armature being driven by helicoidal pinions from the camshaft. The distributor is composed of a fiber cam having a brass core revolving in front of an ebonite plate holding four brushes which friction on the cam. To dismount the distributor no tool whatever is required; a half-turn of a catch and it is freed. All the wiring is carried in a metal tube running over the cylinder heads, the connection to the plugs being made by convenient ebonite discs.

In one respect only has the engine lubrication system been changed. At the forward end of the engine is a three-way cock which, placed in first position, empties the crank chamber, in the second shuts off the flow of oil, and in the third puts the compartments of the crankcase into communication with each other. The regulation of oil for the 50-60-horsepower model is mechanically operated by a dashboard lubricator driven by an eccentric from the camshaft. The oil from the sight feeds is carried to the four main bearings of the engine, the gear box and the rear axle.

Self-starter Is a Distinctive Feature of the "Six."

The distinctive novel feature of 1908 Renault models is the use of a self-starter. Although this is provided as an extra, all the larger engines are fitted to receive it without any structural change. At the forward end of the engine, and operated off the camshaft, is a vertical, air-cooled pump compressing air into a tank carried within the frame to the rear of the dashboard. On a pressure of 45 pounds being reached, a diaphragm acting upon the admission causes the pump to run idle. Between the air tank and the cylinders is a controlling mechanism mounted on the dashboard, and consisting, in addition to a cock opening or closing the passage of air to the cylinders, of a gauge and outlet, allowing the air to be used for the inflation of tires. A distributing drum, actuated by a hexagonal shaft driven by a helical pinion from the camshaft admits the flow of air into each cylinder through an automatic inlet valve at the commencement of the working stroke.

Clutch, gear set and transmission show few changes from previous models. The clutch is of the direct cone type, the face of the female member being cut to form tongues which aid in obtaining a progressive hold. Four speeds forward and reverse arc obtained through a progressive type of sliding gear transmission, giving direct drive on the high. Final drive is by cardan shaft and rear live axle.

Suspension on the six-cylinder and all larger models is by three-quarter elliptical springs in the rear and semi-elliptics in front. In addition, the Renault hydraulic shock absorber is fitted both front and rear. For use under the rougher road conditions of America, all chassis are equipped with heavier axles and springs and are given a slightly greater clearance. The body building space on the six-cylinder model is 118 by 30 $\frac{1}{4}$ inches. Wheels are 935 by 135, front and rear.

HOFFECKER CORRECT UNDER A. C. A. TEST.

In connection with the report of the first public tests of the dynamometer installation of the Automobile Club of America, held early in January, it was reported that the Hoffecker speedometer, when tested in comparison with the speed-recording apparatus of the equipment, did not agree with the latter at the higher speeds. It appears that this was an error, due probably to the difficulty of watching both the speedometer and chart readings at the same time. The official results of the tests, made public subsequently and testified to by both President Colgate Hoyt and Dr. S. S. Wheeler, showed the Hoffecker speedometer with which Mr. Hoyt's car was equipped when under test, to have been perfectly accurate at all speeds tried, which were ten, twenty, thirty, forty and fifty miles per hour.

AMERICA HAS AN AERO INVENTOR IN FRANCE

PARIS, March 2.—Among the small army of enthusiasts gathered in and around Paris with the intention of solving the problem of aerial navigation, America has her own representative in the person of W. H. Fauber, formerly proprietor and manager of the Fauber Manufacturing Company, Chicago and Elgin, Ill. After months of quiet experimenting, Fauber has secured from the German authorities a master patent on an aeroplane which, he believes, will cause a sensation when shown to the public. A German patent being the most difficult to obtain in the world, and only granted after thorough investigation, the mere fact that the Fauber aeroplane has been accepted is proof of its value. Before patents were granted canvas and bamboo models had to be produced and flown before the authorities.

Fauber has commenced the construction of his patented aeroplane, fitted with special pneumatic tires, and will equip it with a 24-horsepower Antoinette engine. Total weight, with the pilot aboard, will be only 510 pounds. Although he would prefer to have a 50-horsepower engine, Fauber declares that he will make attempts at flight with the smaller power as soon as possible. In his opinion the Chanute type of aeroplane as used by Farman is fundamentally wrong and, though successful for short distances, will never be of much practical value. An aeroplane built under the Fauber patent will be as self-balancing as a boat, and will allow the pilot to rise to any height with safety. Should the motor stop or the steering gear become disarranged, the machine would still descend safely. Unless completely wrecked by a storm, the aeroplane would always allow its pilot to gradually come to earth after an accident to the machinery.

Had he not been fully occupied with practical hydroplane experiments, Fauber declares that he would have trained and competed for the \$50,000 aeroplane prize recently won by Farman. He had to be content, however, to first secure patents on his flying machine before making it public. Mak-

ing allowance for changes which will necessarily have to be made in the model as suggested by experience, the American aeronaut believes that he will show very practical results before the end of the year. Outside experiments with the flyer will commence shortly and continue throughout the year.

At the present time Fauber is busy on two distinct types of hydroplanes, one with a screw, the other with a paddle. The latter has reached its fourteenth experimental trip, and though not yet quite satisfactory, promises to give good results. A paddle hydroplane, says Fauber, is generally treated as a joke, but this type will prove itself superior to the screw and will prove applicable to large steamers.

The screw propeller hydroplane on which Fauber is engaged is so far advanced that he hopes to be able to build a number of them in the spring, and, if possible, will enter a racing model in the Monaco meet, April 1 to 13. This boat is a combination between a hydroplane and a displacement boat, the bottom being of a special shape and designed to navigate in rough water. It has the appearance of an ordinary boat, but is much more stable and is self-balancing. An 80-horsepower eight-cylinder Antoinette engine without carbureter, the gasoline being injected direct into the cylinders, is employed. These engines are always difficult to start, but when they do get under way they go off like a cannon ball. On the first trial Fauber's superintendent was thrown right over the engine, fortunately without injury, and on the second trial trip the motor started with a rush and snapped off three of the blades of the propeller. Although the propeller was made specially for this work by the Antoinette people, it was not sufficiently strong to stand the enormous strain put upon it by the instantaneous starting of such a powerful motor. This is a difficulty other aeroplane and hydroplane experimenters have had to contend with, and it will be necessary to pay special attention to the study of propellers for use with the eight-cylinder engines.

BIG WAR DIRIGIBLE FOR FRENCH ARMY.

PARIS, March 2.—The French Army has made arrangements with the Lebaudy Brothers and Engineer Julliot for the construction of a dirigible balloon for military purposes of 380 feet in length and of a capacity of 290,000 cubic feet. The gas bag will be made of rubbered cloth of sufficient strength to withstand a considerable increase in internal pressure, and as in all the French military balloons, an internal ballonet fed by a powerful fan will maintain the desired pressure.

In general the characteristics of the *Patrie* and *Lebaudy* will be followed in the platform design. The power plant, however, will be entirely original. Two Panhard motors, each of 120-horsepower, will drive four propellers, two forward and two aft. The engines decided upon are those used in the *Panhard-Tellier* racing motor boat, the fastest craft of its size ever built in France. The weight of each of the four-cylinder motors is 617 pounds. In the motor boat the two engines were placed side by side. Very probably this arrangement will be preserved in the airship, the entire engine platform of the boat being transferred to the war balloon. One reason for fitting two independent engines is to prevent a repetition of the accident of the *Patrie*, where, owing to the breaking of a gear both ignition systems were disabled. It is estimated that a speed of 40 miles an hour will be attainable under ordinary conditions. The *Patrie*, which at the time of its evasion was the largest military airship in commission, was 203 feet in length and equipped with a 70-horsepower four-cylinder Panhard racing motor.

FIRST AERO SCHOOL IS ESTABLISHED.

Without doubt the latest field of knowledge to be entered by the correspondence school is that of aeronautics, which has its first academy in the International School of Aeronautics, recently founded by Albert C. Triaca, at 108 West Forty-ninth street, New York City. Three distinct courses are outlined in the prospectus, covering respectively spherical balloons, dirigibles, and aeroplanes. Recently returned from Europe, where he obtained the diploma of pilot from the Aero Club of France, Albert C. Triaca has gathered together an unusually complete series of models of balloons, aeroplanes, aeronautical engines and all accessories. Connected with the staff are many European experts.

MICHELIN OFFERS \$43,000 FOR AERO RACES.

PARIS, March 2.—A world's challenge cup valued at \$20,000, in addition to \$3,000 in cash, have been offered by M. Michelin for an annual aeroplane race. Though no distance has yet been announced for the first year, it is stated that each year the contest must be held over a distance double that of the preceding year. The trophy will be held by the aero club of the country of which the winner is a native.

In addition to the annual challenge, M. Michelin also offers a prize of \$20,000 to the aeronaut who first travels from Paris to the Puy-du-Dome, a distance of 250 miles, in a heavier-than-air machine. The challenge remains open until 1918. The Michelin factory is located at Clermont-Ferrand, at the foot of the Puy-du-Dome.

SPENT ON FOREIGN AUTOS.

Americans have spent \$31,728,981 on foreign automobiles during the past six years, \$10,576,327 of this amount representing import duty and freight. Excluding taxicabs, auto 'buses and one amphibious automobile which visited these shores, European makers sent 1,300 automobiles to America during the past twelve months, 225 being from one company, 214 from another, and 139 from a third, leaving 722 cars for 45 different makes, or an average of 16 cars apiece. A comparison with the amount done by American manufacturers for the last five years shows enormous strides. In 1903 the American output was \$16,000,000; 1904, \$24,500,000; 1905, \$42,000,000; 1906, \$59,000,000; 1907 (A. L. A. M. estimate), \$105,669,572. This shows that while foreign cars have increased in numbers yearly from 1902 to 1907, the increase is slight compared with the enormous growth of the home industry; even 1907, admittedly a poor year, having a large increase.

Last year there was a falling off in imported automobiles to the extent of 133, representing a value of \$2,569,141. The banner year for the foreigner was 1906, when 1,054 cars were imported at a value of \$3,972,298. Import figures from 1902 to 1907 are as follows:

Year.	No. of cars.	Value.
1902.....	265.....	\$3,581,990
1903.....	267.....	2,927,508
1904.....	605.....	2,240,000
1905.....	1,040.....	3,972,298
1906.....	1,433.....	5,500,000
1907.....	1,017.....	2,930,859

In addition 283 used and second-hand automobiles, on which no duty was paid, and 231 taxicabs and 10 'buses, on which duty was paid, were brought into the United States during 1907. The total of all foreign motor vehicles is therefore 1,541.

What the Cab Business is Coming To.

Scene outside a London restaurant. Hall porter emerges and blows his whistle vigorously. With the first and second blasts a "growler" and hansom dash up to the kerb, but the porter sounds the whistle a third time, the signal for a taxicab. Disgusted Cabby: "Try four, Old Sport, and p'raps you'll git a bloomin' alryplane."—"The Car."

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- Mar. 18-21.....—Rochester, N. Y., New Convention Hall, First Annual Show, Automobile Dealers' Association and Rochester Automobile Club. Bert Van Tuyl, manager.
- Mar. 18-24.....—New Haven, Conn., Muic Hall, Annual Show, New Haven Automobile Dealers' Association.
- Mar. 21-28.....—Toronto, Canada, St. Lawrence Arena, Automobile Show. R. M. Jaffray, manager.
- Mar. 23-28.....—Indianapolis, Ind., Annual Show, Automobile Dealers' Association.
- Apr. 4-11.....—Pittsburgh, Pa., Duquesne Garden, Annual Show, Automobile Clubs of Pittsburgh. Thomas I. Cochran, manager.
- Apr. 5-12.....—Montreal, Canada, Arena, Third Annual Automobile and Sportsman's Show. R. M. Jaffray, Mgr.
- April 6-8.....—Denver, Mammoth Rink, Annual Automobile Show. G. A. Wahlgreen, manager.

Race Meets, Hill Climbs, Etc.

- Mar. 18-19.....—Savannah, Ga., Savannah Automobile Club.
- April 6-10.....—New York City, Automobile Carnival, Illuminated Parade, Hill Climb, etc., New York Automobile Trade Association.
- April 24.....—Briarcliff Trophy Race, Westchester County, N. Y. Robert L. Morrell, chairman.
- May 4-5.....—Harrisburg-Philadelphia and Return, 150-mile Endurance Run, Motor Club of Harrisburg.
- May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
- May 16.....—Hartford, Conn., 200-mile Endurance Run, Automobile Club of Hartford.
- May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- July 6-8.....—Buffalo, National Convention of the A. A. A., and Start of Fifth Annual Tour.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- Mar. 21-28.....—London, Agricultural Hall, Cordingley's Show.
- Mar. 28-April 6.....—Paris, Alcazar d'Ete, Small Inventors' Exhibition.
- Mar. 26-April 4.....—London, Olympia Industrial Vehicle and Motor Boat Show.
- May 17-June 2.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
- December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- April 1-13.....—Monaco Motor Boat Races and Motor Boat Exhibition, International Sporting Club of Monaco.
- April 25-May 25.....—Industrial Vehicle Competition, Automobile Club of France.
- May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
- May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
- May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
- May 31.....—Russia, St. Petersburg to Moscow Race.
- June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
- June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club of Germany.
- July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France).
- July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
- July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
- July 20-30.....—Ardennes Circuit Races and Coupe de Liederde, Automobile Club of Belgium.
- Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.
- Sept. 1-8.....—French Voiturette Contest, auspices of "L'Auto."
- Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

WHAT EUROPE IS BUILDING FOR THE GRAND PRIX

PARIS, March 3.—From what can be learned around the factories, the racers now being built for the French Grand Prix will have a stroke varying from 6.6 inches to 7.08 inches, this latter being regarded as the practical limit for an engine with a bore of 6.1 inches. Panhard, whose three engines are now ready, has adopted the smaller bore of 6.6 inches, for the four-cylinder motors, the horsepower of which is given as 125. Separate steel cylinders with copper water jackets are employed, symmetric valves being on opposite sides. In other engine features the racers follow touring-car models, with Krebs carbureter having hydraulic regulator, centrifugal water pump, honeycomb radiator and disc clutch.

For the first time since 1904, Panhard racers will have chain drive. For the last three years Panhard has built all touring cars with side chains and all racers with shaft drive. This year racers and touring cars will be identical in this respect. The tendency to reduce both wheelbase and track is clearly shown in the Panhard racers, the former being but 104 inches and the latter 51 inches.

Germain, the only Belgian contestant, will, like Panhard, have a full team of four-cylinder cars, with separate steel cylinders copper jacketed. The bore is the maximum, and stroke is declared to be 175 millimeters. Bosch high-tension magneto has been fitted, and engine cooling is effected by means of a centrifugal pump and honeycomb radiator.

Weigel, the only Englishman who competed in last year's race, and received little for his pains beyond interviews with the police, has three interesting chassis under construction for the Dieppe race next July. The four cylinders are in one casting, with valves at an angle of 45 degrees at each side of the domed head. Cylinder bore has been fixed at 154.5 millimeters, half a millimeter being sacrificed in order that there may be no possibility of objection. The stroke is being kept secret, and will not be announced until a few days before the race. The valves, which have a face measurement of no less than 75 millimeters, are so inserted in the cylinders as to decrease pocket area to the uttermost. The exhaust valve is water-cooled round the guide and valve seating, both being part of the cylinder proper. The camshaft, with integral cams, runs in three ball bearings carried in standards cast on top of the cylinders. It is operated at the radiator end by a worm gear and vertical shaft. Wheelbase is 110 inches, transmission is through selective sliding gear, and final drive through rear live axle. The cars are exceptionally low.

Though Edge, of Napier interests, will not appear in the Grand Prix, his cars not being fast enough without forbidden detachable wheels, England will have a six-cylinder representative in the Austin firm. Four cars have been built, all with five-inch bore and stroke, two of them having side chains and two live axle drive. The faster pair will race.

ROYAL CLUB AND UNION STRIVE FOR POWER

LONDON, March 3.—Though the oblique branch is held out by a section of the British automobile clubs, prospects of an entente between the Royal Automobile Club and the Motor Union, principals in the fight for automobile supremacy in Britain, are not promising. The old-established, dignified and royal club is not likely to make any concessions in national control, and the youthful Motor Union, having realized its strength in the struggle, will not be satisfied until it has a real domination in the automobile affairs of the country.

The entire question revolves around the decisions of the provincial clubs, and the body which can secure the larger affiliation will be the one that will have to be reckoned with as master of British automobile organizations. The Royal Club claims that 12 clubs, with an aggregate membership of 3,113, have decided to remain true to them, while 14 clubs, uniting 1,580 members, will affiliate with the Motor Union. Those having decided to remain affiliated with both Royal Club and Union during 1908 comprise 21 provincial clubs, with a membership of 2,482.

This would appear to give the Royal Club a distinct ma-

majority. Closer examination of the two lists, however, fails to substantiate the first impression, the Scottish and Irish clubs, numerically the strongest in the United Kingdom, being the two which have least need of the Piccadilly club. The probabilities are strongly in favor of the Motor Union already having the larger following, and when the twenty-one clubs have got off the fence there is no doubt whatever as to which body will have a majority.

Could some understanding be arrived at immediately the best interests of the automobile clubs would have been served, for the Englishman, despite his inherent respect for established authority, has shown that he has little need for a mummified controlling body, though it may have the King at its head, the right to use the word "Royal," headquarters in Piccadilly, and a train of aristocratic connections. The struggle has quickened the flow of the royal blood and has made the august body more active, more efficient, than at any previous period. It has not diminished the ardor of the Youthful Motor Union, but it has given that organization a more redoubtable adversary. Unfortunately automobilic legislation is neglected as the result of the split.

INTERNATIONAL ROAD CONGRESS IN OCTOBER

PARIS, March 3.—October 11 and seven following days have been selected as the date of the international road conference to which the French government will invite representatives from all nations of the world. The program of the conference, which is due to the initiative of Minister of Public Works Barthou, is the improvement of roads to fit them for modern methods of locomotion. Two main sections have been formed, the first to deal with road construction and upkeep and the second with traffic regulation and road exploitation under the new era introduced by the auto-

During the week of the congress a public exhibition will be held at the Jeu de Paume in the Tuileries Garden, dealing with methods of road construction, tools and machinery for road building and the suppression of dust, models of vehicles and their influence on road surfaces, sign posts, danger indicators, etc. Models intended for the public exhibition should be addressed to the Secretary of the First International Road Congress, Ministry of Public Works, 24, Boulevard Saint-Germain, Paris. Donatory membership can be obtained on payment of \$20; subscribing members pay \$4.

THE WAY OF A POLITICIAN.

Something out of the usual was the visit of State Senator Frelinghuysen to the New Jersey Automobile and Motor Club for the purpose of "discussing" the proposed amendments to the law which hampers the enjoyment of automobiling in a commonwealth where legislators early recognized the value of good roads. One must admire the sagacity of the Senator in accepting the invitation to meet Jersey autoists last Friday night at Newark, but those present soon learned that all politicians are more or less alike in their methods. The man from Somerset County said that he had come to "learn the views" of the autoists, and, furthermore, he was in a "receptive mood." No, he was not prepared to state positively what action he might take upon certain proposals; he would take them "under consideration."

But one should not blame a man who has an eye out for a governorship because he takes inventory of what he has and then seeks information first hand as to the growing strength of those holding ideas contrary to opinions obstinately hugged by his assured constituency. And the Senator found that there is now an organized and determined opposition to further complacent acceptance of automobile legislation which is based on prejudice and with scant desire to grant fair treatment to the new users of the road.

It is among the possibilities that Senator Frelinghuysen may have accumulated more of a reputation as an anti-automobile autoist—for he is a car owner—than he

really intended, and, in looking after the main gubernatorial chance, he may desire to show that he himself is not inclined to be pronouncedly antagonistic to the law-abiding autoist—providing that same autoist is there with the votes. As a matter of fact there is ground for belief that the Senator is the victim of his Somerset supporters, and is really in a deuce of a fix as to how he can extricate himself gracefully and without loss of prestige. Truly, the position of the politician is such as to entitle him to sympathy rather than unlimited condemnation.

We are told by the Senator that conditions are so peculiar in New Jersey that reciprocal recognition of the licenses of other States is impracticable—for the outlanders wear out the roads, disregard the rights of other users of the highways, and commit other crimes. Elsewhere in this country it is possible to punish outlanders when they are guilty of infractions of the autoing law, even when they only carry the registration numbers of their home States; it is also computed that they frequently leave behind enough money to offset any wear of the roads resulting from their passage. But "conditions" in Jersey prevent similar procedure; therefore, the outlanders are remaining outside of the "Chinese wall" in greatly increasing numbers. Roads do not "wear out" in Jersey as in other States; automobiles "destroy" them; therefore, automobilists ought to pay liberally for the "damage" which they wilfully accomplish.

But there is a limit in suffering injustice because a sane law does not replace an obnoxious statute which exists apparently because the machinery of justice cannot be operated—in New Jersey—in such manner as to punish the guilty without hampering the innocent and making his pursuit of autoing subject to interruption and oppression.

The need of local, State, and National organization in automobiling is emphasized in the New Jersey situation. Its ultimate outcome is a certainty.

The visit of the worthy Senator will bear fruit when another crop of legislation is picked.

SHORTENING THE MOTOR'S LIFE.

There are two practices, more or less commonly followed by the average owner or driver of a car, that do more to shorten the period of an automobile motor's active life and cause more damage than would be occasioned by many times their equivalent of legitimate service. One of these is racing the motor idle, and the other is the habit of worrying it over grades on the direct drive. Both show a lack of common sense on the part of the drivers practicing them and are far too generally followed, from which it seems that a little technical knowledge bearing on this point would be an aid in keeping many a car out of the repair shop. Of the two, the first is much more common—in fact, it is almost universal, and is the more difficult to overcome, as it does not produce any apparent bad effect at the time, whereas forcing a motor on hills is apt to stall it and this is regarded as a sign of bungling. But both contribute to place the car in the shop far more often than would be the case with more reasonable handling.

LEWIS F. NIXON ON AUTOMOBILE'S GREAT FUTURE

ST. GEORGE, N. Y., March 7.—The annual dinner of the Richmond County Automobile Club, the most successful in the history of the organization, was held at Tilley's Hotel, with Lewis Nixon as the principal speaker of the occasion. His somewhat impromptu address was intensely interesting and listened to with closest attention. It will be remembered that Mr. Nixon was one of the pioneer designers of automobile engines, but the demands upon his time in other affairs took him out of an industry in the future of which, judging from his remarks, he has unlimited confidence.

President Charles A. Schultz presided as toastmaster, and besides Mr. Nixon, the speakers included John T. Burke, managing editor of the New York *Evening Telegram*; Coroner A. F. Schwannecke, who strongly advised automobilists not to run away from any accidents in which they might become involved; Thomas F. Moore, secretary of the Briarcliff race, who supplied the humor of the occasion; H. E. Buel, who talked upon the boulevard across Staten Island; and A. G. Batchelder, editor of *THE AUTOMOBILE*, who dwelt upon the needs of organization for the purpose of safeguarding the rights of automobilists.

At or near the head table sat Vice-President George H. Waters, J. J. Worrell, the indefatigable secretary, and the entertainment trio, consisting of E. H. Poehn, W. O. Sprigg, and Dr. W. J. Musgrove.

The speech of Mr. Nixon will be read with interest by automobilists in general, and it is herewith given nearly in full:

As to the future of the automobile, probably we can best speak of that by looking at what has been done in the last few years. Probably nothing has been done by mankind in the mechanical world which compares at all with the automobile. It is probably the modern miracle—certainly the one of the century. We now feel that we can travel an ordinary highway with the safety of the railroad train, and with even as much comfort. We feel that it is dependable; we feel that mankind has accomplished a thing in a way which it always does when the mind of man is put to it.

The automobile is, of course, new. In 1900 there were but 3,700 in the United States. In 1904, Americans built over 11,000, and last year over 52,000. There are to-day in this country 152,000 automobile owners. These machines cost to run not less than \$75,000,000 per year, and the actual value of them is \$270,000,000. All business in the country has been stimulated by this industry. Not only that, but the most encouraging thing is that while a few years ago we were obliged to go abroad for our cars, to-day we find ourselves in this country exporting large numbers of cars of every description to other countries.

We know that the American always will develop the very best when he has the opportunity. We all know that years ago the man who worked in the bottom of the ship or in the factory—the man in the overalls—was looked down upon. But to-day we find an entire change, and men who do not have to do that kind of work will go at their automobiles and get themselves well smeared with grease, and are proud of the fact that they have a mechanical knowledge sufficient to enable them to do their own repairing. And this fact is increasing a feeling of respect for the mechanic, and, perhaps, there is nothing that we can bring about in this country that will operate to the advantage of the country more than this feeling, joined with an appreciation of what the mechanic and the engineer are doing for the benefit of the world, and the improvement of all mankind's condition.

Now, it is very hard to forecast the development of an industry and of an art which is increasing by such leaps and bounds the way automobilism is. But we have yet to see the time when the car will be the accompaniment of every home, when people will see that they must have them the same as they have the horse and buggy. Of course, we must always have the horse and buggy. I was looking in an automobile paper to-day, and I saw a description of an automobile buggy, and I thought as I read it: "The world has come into its own; here we have a buggy which can with safety run 30 miles an hour, that will cost \$250, and that will probably compare very well with the old buggy, and with less expenditure for running than with a horse."

There has been a time in the last few years when the joke against the automobile on the stage would bring down the house. And we all laughed. But I tell you to-day that it is to be depended upon. We have accidents that occur through carelessness and ignorance and inefficiency in management, but as a matter of gen-

eral interest we can say that the automobile is now rapidly approaching a perfected state. Then, of course, we find those who are always looking for trouble, and they say that the automobile is affecting the farmer. I don't think so. Ten years ago there were about 14,000,000 horses in the United States of the average value of \$30 each, while to-day there are 20,000,000 horses in the United States of an average value of \$93 each; in other words, an increase in value in ten years of a little over \$30 to \$90 per horse; so I don't think the farmer has shared very badly in increasing a value of \$450,000,000 to \$1,800,000,000 in ten years. I won't say the automobile has done it, but it has driven people to buy the very best of horses.

The use of the automobile at the beginning was naturally more for pleasure, but its rapid increase for business purposes can plainly be seen. Colonel Waring, who was superintendent of the Street Cleaning Department of New York City, told me that there were each day 500 tons of horse droppings in the city of New York alone, and he said that he hoped to see the day when the automobile would supersede the horse in the streets of the city. That was a good many years ago, but it is rapidly approaching, and the trucking that is now being done by auto trucks is enormous. Undoubtedly before very long you will not see a horse in the city of New York. The increase in the health of the city when it comes about will be enormous, and I do not think it will affect the earning capacity of the men who are experienced in loading and handling the present trucks. The automobile's use by big department stores is enormous, as you know, and I think the ultimate result will be that they will have bodies which will be made separate from the chassis, and which, after being loaded, can be placed upon the chassis quickly, and when they come back the empty body will be replaced by another which has been loaded in the meantime, thus decreasing the cost of handling and keeping the apparatus always on the go, which is the aim of all business economy.

The luxurious car will always be in demand. Then again we have the car which will be built and sold at a cost to meet the pocket of the average man, and which will cost little to repair and to operate. In this respect our lawmakers do not seem to rise to the occasion, and realize that we are rapidly increasing the price of gasoline, which seems to be the only present commodity we can use for fuel.

In fuel we must face a scarcity in gasoline and a rapid advance in price. But there is one inexhaustible source uncontrolled by owners of mines or corporations. That is alcohol. Anything that will ferment will make alcohol. The grain, rotten apples, pumpkins, grapes and other products of the farm will go into tanks and the farmer will produce a fermented liquid that can be refined at central stations into high-grade alcohol. The law regulating the production of alcohol was not intended to make it commercially obtainable. In Cuba alcohol can be bought for 10 cents a gallon. The people will ultimately wake up and demand proper legislation, and it is not a far stretch of the imagination to see us light our houses, heat our dwellings, cook our food and run our cars and factories by alcohol produced by the American farmer.

Where we are tied down by rail you will find that the automobile car is coming into rapid use. They are building cars to-day about 65 feet long which will easily make sixty miles an hour and which are fitted up with all the various comforts that go with the steam car. They will come into use more and more. We expect it.

When we look into the future and stimulate our imagination, we can see that the needs of the people will bring about an aerial system of transportation. We know that the aeroplane will be used, and we shall then be able to get to Philadelphia at a rate of 160 or 170 miles an hour, traction being by some special method.

The development in war is another feature of the automobile. The flying machine which leaves the earth we can look forward to seeing. It is the necessity of modern civilization, and it will be used in the next war undoubtedly. But we have torpedoes that we use under the water, and we will also undoubtedly have land torpedoes. These will be in the shape of the original automobiles, and these will be filled with high explosives and controlled by paid-out wires or wireless.

All these things are only some of the little forecasts that are to be seen at the present time as the future of the automobile. The greatest good to the people comes by our getting all we can out of our lives, and that is naturally to our advantage. I have no doubt but that the men of the present day do more work than in the past; they get over a great deal more ground and accomplish a great deal more.

Many devices having to do with automobile construction are being radically improved or bettered. Carbureters and tires are receiving the attention of the inventive minds and appliances for lessening the danger of accidents of all kinds are of almost daily birth.

Then, again, as to the roads. We still have the bogs and miles

between small towns, but, I think, as our needs in this direction grow, we shall have all of these communities joined by very wide roads, which by means of short-time franchises will warrant those holding such franchises constructing substantial roadbeds, certain parts of which will be limited to automobile traffic. I think the people will take the initiative and give us the blessing that good roads will give us. I believe that the enterprise and the public devotions of the officers of this borough of Richmond have built up the highest state of roads I have ever seen. I do not believe you can ride over any other roads with more pleasure than you can on the roads of Staten Island. Take, for instance, the idea of a boulevard to Tottenville from the ferry. You will find that such a run would attract the automobiles from all over.

And that brings me to what I want to say particularly, and that

is, I want to ask every one to appreciate what has been done by this club, and by the president and secretary of it, Mr. Schultz and Mr. Worrell. They have been whole-hearted and devoted to the interests of the club and the safety of automobilists in general, and I believe that the time will come when we will see an automobile clubhouse on Staten Island. I am sure that the island will grow—it is growing—and as the automobile will become more and more part of our life we shall find the needs of a clubhouse with a garage. We shall see that the automobilists will awake to the occasion and realize that it is incumbent upon them to support the club in every way possible, and that its ambition will be realized, and we shall have on this beautiful Staten Island not only an automobile club, but an automobile clubhouse, with Mr. Schultz as permanent president of it.

NEW JERSEY'S LAW "DISCUSSED" WITH SEN. FRELINGHUYSEN

NEWARK N. J., March 9—The automobilists of New Jersey are still discussing the visit of Senator Frelinghuysen to the New Jersey Automobile and Motor Club on Friday night of last week. This wide-awake organization invited the Senator from Somerset county to attend an open session at its clubhouse, to which were also bidden delegates from other Jersey clubs. The club's quarters on Broad street were packed to suffocation and both the present law and the proposed amendments to it received vigorous attention all around. Ultimately those present took action as outlined in the resolutions herewith given:

Resolved, That this club is in favor of a law which will require that every vehicle using the highway shall carry a light at night, and pledge ourselves to support such a bill by endeavoring to secure the support of our Representatives and Senators to that end.

Resolved, That this club is in favor of the amendments as presented by Senator Frelinghuysen to the crimes act in reference to placing glass or other hard substances upon the highways, and refunds to the State of fines inflicted by local justices.

Resolved, That this club is in favor of a tourist privilege to be extended free to non-resident tourists, provided they are duly licensed in their home State and carry sufficient identification tags to insure compliance with the laws of the State of New Jersey.

Resolved, That this club is irrevocably opposed to the license fee proposed to be assessed against the automobilists and dealers of this State, and unless a fair and equitable schedule be substituted therefor, this club is authorized to contribute its proportion to the general fund for testing the constitutionality of a law which permits high and prohibitive double taxation under the cloak of license or registration fees.

Resolved, That it is the sense of this meeting that licenses being granted in perpetuity to manufacturers or dealers in automobiles, as provided for in Part IV., par. 16, sub-division 3 of the present automobile law, no other law can be enacted or tax levied for the purposes as outlined in said law, and any effort on the part of members of the Legislature to annul this provision will be vigorously opposed.

Resolved, That it is the sense of this meeting that the department of motor vehicle registration and regulation shall remain under the jurisdiction of the Assistant Secretary of State, as at present provided.

Resolved, That this club is in favor of a reasonable and safe speed limit consistent with the circumstances, and which will fix the maximum speed at not greater than thirty miles an hour, such provision to be drawn in such a way as will provide for the safe use of the highway by all, and which will command the respect of every user of the highway.

Resolved, That if the present amendment be not so amended as to secure to the automobilists of this State reasonable and fair treatment, the legislative committee of this club be authorized and empowered—in conjunction with the other clubs of this State—to prepare and present for passage a fair and reasonable automobile bill based on common sense and the lines as have been adopted in many of our sister States.

Resolved, That a vote of thanks be extended to Senator Frelinghuysen for his courtesy in attending this meeting and for the frankness with which he has expressed himself in reference to the subjects under discussion, and that the secretary be instructed to transmit to Senator Frelinghuysen copies of the resolutions adopted at this meeting, with a request that he endeavor to have the present automobile law amended so as to meet with the approval of the automobilists of this State.

It will be seen by the reading of the resolutions adopted that the automobilists and Senator Frelinghuysen are at a considerable distance from each other in reaching an agreement. The

discussion made plainly evident the fact that the Senator has political aspirations which may have a bearing upon his automobile law-making, though he took occasion to repeat several times that politics did not enter into the matter in the slightest degree.

There was some other plain speaking by George A. Post, of the North Jersey Automobile Club, who said that he intended to offer a reward for the arrest of Senator Frelinghuysen for violation of the speed limit of the present law. Dr. J. N. Faulkner, also of the Paterson club, asked the Senator if he had ever violated the 20-mile speed ordinance.

"I might ask the doctor the same question," responded the Senator.

"Answer mine first," retorted the physician.

"Never willfully, and not knowingly," was the answer from the Senator, which was greeted with laughter. Dr. Faulkner's only answer was that he had heard that the father of the automobile law traveled faster than twenty miles an hour every time he went out in his car. "He ought to know by this time," said the doctor, "that it would be impossible to keep within the limits."

The autoists argued that the speed law was openly violated, and they openly admitted that they all violated it repeatedly when they operated cars that could travel at a fair rate of speed. Joseph H. Wood, who introduced the resolution providing for an increase in the speed limit, admitted that he was a law-breaker, and produced a record of his runs through the city at an average speed of from ten to sixteen miles an hour and from eighteen to twenty-six miles in the country. Mr. Wood said that he has never been arrested, and although he had traveled as much as 35,000 miles, he had done no damage. He said that it was impossible to maintain an average speed of twenty miles, and every operator of an automobile, not even barring Senator Frelinghuysen himself, was a law-breaker. Mr. Wood said that the New Jersey automobilist has practically been crucified upon the cross of political ambition of a few legislators.

Richard C. Jenkinson stated that the Newark Board of Trade was interested in the question from an industrial standpoint, and said that the automobile industry was of vital importance to the city and State from the fact that every part of a motor car was manufactured here and that thousands of people were kept employed.

President Mason, of the Passaic Board of Trade, was another who struck the bull's eye many times, according to those present. A. G. Batchelder, who recently became a Jerseyman, illustrated the attitude of non-resident autoists toward the State on account of its unfair law.

Senator Frelinghuysen defended the present statute and its non-reciprocal license feature, and otherwise spoke favorably of it. He said he would take "under consideration" the various things suggested, and asked for a copy of the minutes of the discussion, so that he could "confer" with his associates in the legislature. The opinion of the automobilists generally is that the day for conferring is past, and it is among the probabilities that if necessary the war will be carried into Somerset county.

VIRGINIA AND CAROLINA AUTOISTS AFTER GOOD ROADS

BY F. S. SLY, TRAVELING CORRESPONDENT OF THE AUTOMOBILE.

NORFOLK, VA., March 4.—Considerable activity is being displayed by the Norfolk Automobile Club in the agitation for good roads, particular attention being paid at the present time to securing a good road between Richmond and Norfolk and between Norfolk and Virginia Beach. A bill is now before the State Legislature providing for the appropriation of \$250,000 for State aid in road building.

The Norfolk Club, with a membership of fifty, has opened a campaign for new members. The officers of the club are: President, Abbott Morriss; vice-presidents, F. O. Smith and D. P. Paul; secretary-treasurer, C. L. Young.

Most of the cars in the city of Norfolk are used for pleasure only and are laid up in Winter. There are two reasons for this: the roads around Norfolk are very bad, and public and private garages are thin, frame buildings, affording no protection against freezing. There are two public garages, Harmon's and the Rambler, both with good repair shops; in addition there is one shop undertaking repairs only. There appears to be a splendid opportunity for a good brick garage here. Places of interest within twenty miles of Norfolk are numerous, especially along the shore. The country has no hills at all and only a few ten-foot rises.

Practically all kinds of automobiles are used in Norfolk, the most prominent makes being White, Rambler, Ford, Mitchell, Franklin, Peerless, and Oldsmobile.

Virginia Beach at some seasons of the year supplies an excellent course for ocean "breezing." But for racing the beach did not answer satisfactorily.

GREENSBORO, N. C., March 9.—Though automobile conditions are far from ideal in North Carolina, roads still being in a very elementary stage, Greensboro has about forty-five cars in regular use. The city does not yet possess an automobile club, though two garages and three agencies are maintained. The Greensboro Motor Car Company, with agency for the Ford line, possesses the best garage; the Caroline Motor Company, with agency for the Buick, has also a garage. Reo cars are handled by H. L. Hopkins.

Road conditions are bad in this neighborhood, the surface being formed of heavy clay. Steps, however, have been taken for the construction of a large amount of macadam road, 170 miles of improved highway having already been built and 40 more being under construction. Much of the road building in this section of the country is done with convict labor.

WINSTON-SALEM, N. C., March 10.—About eighty automobiles are owned in Winston-Salem. The formation of a club has been discussed on numerous occasions, but no definite move has been made up to the present. The majority of the roads in the county are of the clay variety, and consequently have little that is inviting to automobilists. Considerable activity, however, is being displayed in the construction of improved highways, the county having already done a large amount of work in this direction.

Maxwell, Cadillac and Buick are represented in the city, their respective agents being Winston Automobile Company, Forsyth Sporting Goods Company, and P. Somers. The two former maintain garages.

INDIANAPOLIS NEARING THOUSAND MARK.

INDIANAPOLIS, IND., March 9.—From a complete examination of the registrations filed with the Secretary of State, a local authority finds that there are about 800 automobiles in the city of Indianapolis. It is not reasonable to suppose, however, that all automobiles in Indianapolis are registered, due to the fact that the police have never made an effort to enforce this phase of the law.

The Premier, manufactured by the Premier Motor Manufacturing Co. of this city, stands at the head of local registrations. Other Indianapolis manufacturers show up well, and touring cars predominate, the majority of runabouts being used by physicians, salesmen and people in moderate circumstances. More than 25 per cent. of automobiles used in the city were manufactured in local plants.

The comparison made was taken from 5,000 automobile registrations, showing that about 16 per cent. of the automobiles in Indiana are owned in Indianapolis. City officials who have sought to enforce the city license ordinance have usually estimated that there were 1,200 automobiles in Indianapolis, or that about 25 per cent. in Indiana were owned in the city.

The number of automobiles in the city have more than doubled during the last three years. Until the close of the 1904 season there were barely 300 cars in the city, and they are now increasing from 150 to 200 a year. Indications are that at the close of the 1908 season there will be at least 1,000 automobiles in Indianapolis.

Automobiles having the greatest representation in the city are: Premier, 83; Cadillac, 61; Pope Waverly, 51; National, 51; Ford, 48; Olds, 40; Maxwell, 37; Autocar, 32; Marmon, 31; Rambler, 28.

Roads improvement has been marked in Indiana during the last two years, and the farmers particularly are now favorable to the betterment of the highways.

PENNSYLVANIA AUTOISTS IN COUNTRY TOWNS.

PITTSBURGH, March 8.—A careful investigation of automobile conditions in Pennsylvania shows that a majority of the 8,717 cars now in use in the State are owned by people living in the so-called country towns. It is in these towns that the automobile has come into general use for real service, while in the larger cities it is still largely a luxury and kept for show. There is not a good-sized town in the Keystone State which has not now from one to a half-dozen flourishing automobile agencies, and this year promises to be a much better season for these dealers than for the agencies in the big cities of Pittsburgh and Philadelphia. Second-hand machines are already in great demand, and the moderate priced 1908 cars are selling much better than one year ago.

Under the direction of Thomas I. Cochran, preparations are going ahead rapidly for the second annual automobile show of the Automobile Club of Pittsburg, to be held in Duquesne Garden in April. The Old King Cole Papier Mache Company has the contract for a large part of the decorations, which promise to be the finest ever seen in the Garden. Large eagles, speed wings, paneled ornaments, massive shields, and eagles will be seen on the marble pillars, and there will be ornamental balustration around the first floor.

BAR HARBOR AGAIN AUTOMOBILELESS.

BAR HARBOR, ME., March 9.—By an overwhelming majority, Bar Harbor has voted to be an automobileless Eden during the coming season, as it has been during the past year. It is situated in the town of Eden, and at the annual meeting of the latter the vote stood 415 to 174 against permitting automobiles to run on what is known as Bay View drive, so that the atmosphere of Maine's chief summer resort will be free from the taint of half-baked gasoline and its roads unmarred by the track of pneumatics.

SAVANNAH'S MEET WILL HAVE SPEED IN ABUNDANCE

SAVANNAH, GA., March 9.—Record speed is anticipated in the two-day races on the Savannah course, March 18 and 19. During a recent practice spin one of the entrants for the 360-mile contest traveled at the rate of 86 miles an hour for a distance of five miles on the flat, speedy course, and has made the inhabitants of the district certain that the Ormond record of 77 miles an hour will be beaten. Edgar Apperson, entrant of one of the first cars, gives it as his opinion that the course is the fastest in America.

Among those now practicing on the course are the drivers of the Isotta-Fraschini cars, five Appersons, and a six-cylinder Thomas Flyer. Everything is now ready for the race, and so much has interest increased that a number of additional entries to the seventeen already received are expected.

A race within a race that is attracting considerable attention is the \$1,000 challenge between the American roadster and the Apperson Jackrabbit. Both machines are reputed to be very fast, and are so evenly matched in power as to assure a very keenly disputed race. Either George Robertson or Herbert Lytle will be at the wheel of the Apperson. The American will be piloted by its designer, Fred I. Tone.

As a last step preparatory to the races the Savannah Automobile Club has become an incorporated body. Among the incorporators of the club are Mayor Tiedeman, Chairman of Council Richard J. Davant, who is chairman of the executive committee having the races next week in charge; President W. W. Williamson, of the Chamber of

Commerce; President Wright Hupnter, of the Board of Trade; Alderman Frank C. Battey, president of the club, and other well-known Savannahians. At the organization meeting of the club Mr. Battey was re-elected president and Arthur W. Solomon, secretary and treasurer.

Pullman vs. Studebaker: Philadelphia to Savannah.

PHILADELPHIA, March 9.—Somewhere between this city and the Virginia-North Carolina line two local cars are floundering through the mud at a two-miles-an-hour clip in an endeavor to be the first to reach Savannah. The New Year's endurance run clean score Studebaker, whose owner has been carrying a big chip on his shoulder ever since that event, found an opponent almost at the last minute in the Pullman "Forty," after having made all preparations to start alone. The new conditions required some hustling, but after a slight squabble over the number of drivers to be carried and the fact that the Studebaker was a 30-horsepower touring car and the Pullman a 40-horsepower roadster, and a little delay in securing official observers, the two cars were sent away from the Hotel Walton at 8:30 A. M. Wednesday last. Heard from last Saturday, the Pullman was about 20 miles in the lead, between Fredericksburg and Richmond, the Studebaker having just arrived at the former place. It took 40 hours, six horses and two negro drivers to get the Pullman over the 50 miles between Centerville and Fredericksburg—about a mile per gallon of gasoline.

A. L. A. M. MECHANICAL BRANCH ADOPTS STANDARDS

AFTER an interval of three months, during which a special committee had been experimenting and investigating, an unusually important meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers was held Tuesday at the Transit Building, New York City, the results of which are given out in the following official report of the meeting:

The special committee appointed to work with the Test Committee toward the standardization of rod and yoke ends, made an elaborate report on what it considered the proper sizes for the standardization of these important parts of construction. Standards for 3-8, 5-16, 1-2 and 7-16 rods were adopted and will be known as the A. L. A. M. standard adjustable rod and yoke ends. With the adoption of this standard, the manufacturers of rods and yoke ends will carry in stock a full line of the standards adopted so that users of the sizes which have been adopted may be able to buy in the open market such sizes necessary. This is of particular benefit to the user as the parts will be interchangeable, and the rods of one car will do for another.

Another important standardization was that of levers. Various weights and sizes of levers have been used with a considerable expense to those automobile manufacturers who do not have drop forging plants. Owing to their inability to buy stock levers, they must necessarily buy the dies from which these forgings were made and with the changing of the type or weight of the lever, new dies, at an increased expense, are necessary. After careful consideration, the Branch adopted a uniform modified I beam lever, which the drop forge makers will carry in stock.

The committee appointed to report on the standardization of rims felt that the time was not ripe for a universal adoption of the standard rim, owing to the fact that it was impossible to tell whether the clincher or demountable rim would be in vogue. The use of spare wheels instead of demountable rims was given consideration and the Rim Committee empowered to make a further investigation on this matter.

At the afternoon session, Dr. Charles Edward Lucke, of Columbia University, who has been making some very exhaustive tests with alcohol as a fuel for internal combustion engines, delivered an address to the Branch. Dr. Lucke's remarks were principally in making comparisons in the tests he had made with the use of alcohol or gas engines for locomotion as compared to those for stationary

use. He pointed out clearly to the Branch that with certain types of engines he could start with alcohol as easily as gasoline, by the use of a spray carburetor with the ordinary needle valve. He said that he did not feel that the time was opportune for a universal adoption of alcohol for practical use, especially in automobile engines, owing to the absolute necessity for a minute adjustment of carburetor and ignition which could not be had in automobiles, owing to the inexperience of many drivers and owners.

E. R. Hewitt, who has been experimenting with alcohol for commercial purposes, gave some interesting data on the results of his work. Mr. Hewitt adapted an engine to the use of alcohol for a five-ton truck. On gasoline with a full load 41-2 miles on a gallon of gasoline could be had. On using the motor without readjustment, only over two miles per gallon of alcohol could be gotten, but on raising the compression from 75 to 120 pounds, he was able to get over five miles to the gallon of alcohol. He pointed out that it was necessary in this case to place the carburetor as near the engine as possible in order that the mixture would be sent into the cylinder not less than 72 degrees. In cold weather he was able to overcome the loss in the vaporization by surrounding the in-take pipes with the water jackets which kept an even temperature for the vapor until discharged into the cylinder. It was the consensus of opinion that for commercial work alcohol, in the near future, would be the most economical fuel to be used. An interesting lecture on the use of pyrometers for indicating and recording the heat temperature in treating steel, was delivered by W. H. Bristol and Charles Engelhard.

The session closed with the annual election of officers. This resulted in a unanimous re-election of the present incumbents, which were: A. L. Riker, Locomobile Company, chairman; Coker F. Clarkson, secretary; Henry Souther, metallurgist with H. E. Coffin, Thomas Detroit Company, chairman of the test committee. Those present were:

John A. Baumgardner, Autocar; A. N. Manross, Corbin; H. P. Maxim, Electric Vehicle; J. H. Becker, Elmore; John Wilkinson, Franklin; Charles Lohr, Haynes; E. R. Hewitt, Hewitt; H. G. Farr, Knox; E. F. Russell, Locomobile; Charles R. Greuter; V. N. Gunderson, Northern; Geo. B. Dunham, Olds; Allen Loomis, Packard; L. H. Kittredge, Peeries; David Ferguson; Robt. Jardine, Royal; Alden Sampson, 2d. Sampson; E. T. Birdsall, Selden; Henry Hess, Stearns; John G. Utz, F. P. Nehrbas, Thomas; F. D. Howe, Waltham; C. D. Smith, Winton; Henry Souther, metallurgist; A. L. Riker, chairman; Coker F. Clarkson, secretary.

Captain Hans Hansen, ex-De Dion Pilot, Meets Roberts and the Thomas Car on Which He Will Continue to Paris.

AMERICAN INCREASES LEAD IN PARIS RUN.

Rapid progress has been made through Nebraska and Wyoming by the American contestant in the New York-Paris run, the Thomas at the end of the twenty-seventh day being more than 300 miles ahead of its nearest competitor. Montague Roberts made a fast sprint of 105 miles into Cheyenne, there turned the car over to E. Linn Mathewson, and returned east to fulfill his racing engagements. It is now certain that the leaders will push ahead under their own power to San Francisco, instead of being shipped from Ogden to Seattle, as originally announced. Captain Hansen, who started as pilot of the De Dion, and was unable to work in harmony with Saint-Chaffray, has joined the Thomas car and will continue with it to Paris.

The French De Dion has had a vein of ill-luck since its Norwegian pilot threw up the command. After five days lost at Cedar Rapids making repairs, the car set out only to break down again at Omaha, where it will be held at least three days more. The driving shaft was broken in the run through Iowa; repairs made in local shops proved unsatisfactory, and it will be necessary now to wait for spare parts shipped from France and already received in New York.

The Italian Zusta, after repairs in the Union Pacific shops at Omaha, Neb., is pushing ahead rapidly, has now left the De Dion 360 miles behind, and with promise of better roads ahead may diminish the distance separating it from the American car.

Changes have taken place in the composition of the Protos crew, Engineers Hans Knappe and Ernest Maass having abandoned and returned to Europe, after a disagreement with Lieutenant Koeppen. The two army officers put forth as their grievance that Lieut. Koeppen, a passenger and newspaper correspondent unacquainted with automobiles has been receiving all the glory and monopolizing all attention.

Charles Godard, who has been awarded the title of "Baron" since going west, is playing a trailing game, being now about one thousand miles behind the leader. He has met with frequent mishaps, complains of excessive charges, the bad roads, and has asked and been refused permission to ship his Motobloc on the railroad. Mileage for the last seven days is as follows:

Car.	Country.	day. 22d	day. 23d	day. 24th	day. 25th	day. 26th	day. 27th	day. 28th
Thomas (America)	1,536	1,627	1,767	1,908	2,052	2,109	2,206
Zusta (Italy)	1,458	1,467	1,488	1,536	1,536	1,690	1,878
De Dion (France)	1,262	1,262	1,262	1,262	1,313	1,331	1,331
Protos (Germany)	1,043	1,043	1,043	1,078	1,118	1,181	1,262
Motobloc (France)	1,043	1,043	1,043	1,093	1,101	1,101	1,101

BLAZING THE WAY FOR THE ZUST CAR.

By JOHN W. BREYFOGLE.

"Everybody out, please. Now, gentlemen."
 "Ze oil? Oui." Purr-r-r, bang. "C'est très mauvais."
 "This the German car?"
 "Naw. Can't you see it's built in R——."
 "What you mean by Gearless?"
 "Go to"—wrrir-r-r, bang, bang, pop, s-s-s.

Silence for a moment, then from aloft, a fierce-eyed figure in Turkish veil and nightgown roared, "Get out." More silence, then an awed whisper:

"That's Hansen; he's the fellow that went to the North Pole."
 "'Taint Hansen; he's with the Ger——" Bang, bang, bang.
 "What time you lave?" "How much horse,—frict—drive,—how," pop, spt, whirr, r-r-r bang. Then somebody thought of the hose and we had peace.

They did not exactly leave the dinner table of the Geneva Club. They faded away, each with the be-back-in-a-minute air, but straight to the garage they went and tuned, tuned, tuned; each with one ear on the other fellow's motor and smiling like a dozen women after the same hat.

Something was going to be doing on the morrow. "Let us continue together," said Saint-Chaffray. "Let us follow the beautiful pilot car; we shall enter Rochester together like brothers; the flags shall entwine, it shall be a glorious." "Sure," said Ruland, as Sirtori grinned. Roberts merely tuned. It was nearing Buffalo and entwining was bad business.

Gearless Pilot Car Which Broke the Way for the Zusta.

When we hauled up at the roadside to await Züst, no one knew it for the beginning of a long winter trip. Like the Great Harry she came—the Züst—high of poop and low of stem, thundering broadsides across the snow waves, and the Gearless dived for its place and the trip was on. Soon we made up the two miles the tardy one had lagged behind and caught the leaders only to see the Thomas disappear in the distance, while De Dion blocked the road in a drift. Then came the grinding of a chain guard in a sprocket, a broken radius rod, and the "Great Harry" limped into Rochester to the home of its pilot for repairs.

Midnight Adieux, then a Plunge into Snow.

It was the following midnight as Züst said her goodbye to the crowd of Italians who had hung for days around the Four Corners and Powers Hotel, and started over the crackling snow in the pilot car's wake. It was cold. At least we thought it was cold then. We were to acquire knowledge later. Following the frozen Genesee on through Scottsville and LeRoy, the old, old way, but oh! so different in the frosty moonlight, we arrived at Batavia and found—nothing. The Buffalo pilot car was not. Doubtless they were waiting at the city line with the city keys and glad hand, but at that point there was naught but an Owl car, and the attendants of the garage whom we aroused merely replied to our queries about Thomas and De Dion with the one word, "went." So we went likewise, and at once, to discover at Silver Creek that there was much pother in the Sleeping City, hasty repairs, curses and mighty preparations for pursuit. Finding ourselves in the lead, we cut the pace to decercy, with visions of Ashtabula as the night's stop. But Ashtabula turned Ripley and more radius rod repairs when, after another all-night job, we again took the road. De Dion and Thomas were seventy miles ahead, and crippled Züst lost steadily to Cleveland, one hundred and twenty-seven miles behind.

To Cleveland the way had been normal and lacking in any special characteristic, but beyond in the storm lay a land of romance. At midnight when the long dark rows of houses seemed a continuous prison wall, when the snow drifted over the deserted streets, covering the car tracks like a ragged garment, when the lights burned dimly like tapers upon ancient graves, when no living thing stirs, when the snow mounds seem to cover the debris of a long ruined city and all is deserted and cold—in such a night to start for nowhere is dismal. Once the lights of Rockey River were behind, there were no others, nor was there a road. Mile after mile the cars ploughed a trackless, rolling plain, undistinguishable from the fields which skirted it. Houses fell to ruins. Twice only we paused, once as the pilot car fell into an unseen hole beneath the snow, and once again to tighten a clutch, upon which we worked by dim lamp-light like ghouls, while the snow muffled all sound; then on again.

Noon brought Toledo and breakfast, and a counsel, as we took stock of our forces; things were beginning to be a bit lazy by now. Ruland had had no sleep, save in the car, since Rochester; Wilcox was down with the grippe and the rest of us wobbled a trifle in our walk, but Thomas and De Dion were still ahead, so we decided to continue.

Before, the snow had merely been a discomfort, but now it began to be a hindrance, and the further we went the more hindrance it became. Thirty miles out, at Wauseon, after six hard hours, the good innkeeper brought forth hot coffee and hot "dogs," and a storekeeper opened his store, and such a buying—overcoats, shirts, gloves, boots and socks.

It was some four hours later that we encountered that strange hill in the road. It began just under the radiator and went up and up, but the most peculiar part of it seemed to be that we could not catch it. How far we chased it no one can tell, but finally we got our front wheels on it. Just then the lights went out. When they came on again, the writer was draped over the back of a seat and Shannon was at the wheel. I know perfectly well what brought me to—it was the absence of Züst's strange popping exhaust, and upon looking back all was darkness. Five miles behind; when we got there the matter stood explained.

Sirtori had met that strange hill, too, and Züst was in as nasty a snow ditch as was ever seen, and careened until her gasoline would not flow to the carbureter. For two immortal hours the Gearless tugged at that seventy-five hundred pounds of ditched dead weight and inch by inch drew it into the road; then, without stopping for breath, we tumbled in and arrived in due time at Bryan. That was a fine town, that Bryan, and it sported two hotels, but one was too fatigued to furnish breakfast and no one could find the other, so we untangled the local whiskers from out our machinery and moved on.

Strenuous Driving Brings Its Reward.

Night, our third of continuous driving, overtook up in the wilds. We were in Indiana, and knew it, too, by now. It was here that Ruland produced those famous frozen eggs, which we thawed out and ate in great gulps. We had now, at 8:00 P. M., been driving sixty hours continuously, save the two hours Sirtori and the writer napped it at Cleveland, but sleep was far from us, for we were nearing Kendallville and there were Thomas and De Dion. Averaging three miles per hour, we continued, ramming snowdrifts and digging ourselves out. At midnight we met our worst drift and here things became serious, for after being in it for two hours, we began to have trouble keeping each other awake; then, too, the drift made faster than we could dig it away. Finally we ahead grew desperate, and jumped and plunged with the Gearless until the drift opened and we passed on our way, arriving and basking in Saint-Chaffray's smile at 3 A. M., after sixty-seven hours on the road, and after reducing the one hundred and twenty-seven miles to a bare eleven; for the Thomas, at our approach, had left in the night and moved to a little town ahead. The remainder of the trip was uneventful, snows were deeper, going was harder, but we slept and ate, joined mostly with De Dion and content to travel with our friends. Züst lost a full day at Kendallville, due to no other cause than that at New York in the custom house, the car stood with full radiator and, in spite of repeated protests, none were allowed to touch it. The result was a frozen radiator, which split across the top.

Without sleep, without food, fierce looking, wild-eyed men. Ahead a long red demon and behind the "Great Harry," filled with untamed Cossacks, and barking defiance across the land. And these men and this great ship on wheels, this seventy-five hundred pounds of car, clothing, rifles, provisions, parts and even tallow candles, twenty pounds of them, are to cross the world and tackle the Polar. Oh! the wonder of it, the wonder of it.

FOREIGN TOURING LITERATURE BY MAJA CO.

Foreign touring becoming more and more popular among automobilists, the American branch of the Maja Company, Limited, has added a publication department to its touring bureau, and will shortly publish a very complete "Guide Book to European Touring," by E. B. Gallaher. The work outlines a large number of touring routes throughout Europe, in conjunction with a series of modern maps, gives a full list of agencies, garages, hotels, official stopping places, information regarding shipment of cars, custom details, police regulations, and local and governmental laws throughout Europe. Reproductions of the forms which must be filled out for all licenses and other applications are included.

PARIS POLICE WAITING FOR FRENCH DRIVER.

PARIS, March 2.—Interest in the New York-Paris "race" in the French capital is confined almost entirely to the columns of the *Matin*. All other journals, technical and otherwise, criticise and ridicule the event. Several papers state with sarcasm that Godard's reason for remaining in the rear is that he has been condemned since his departure to eight months' imprisonment and the repayment of 5,000 francs obtained under false pretenses during the Pekin-Paris run.

BUFFALO'S SHOW VERY ATTRACTIVE AND SUCCESSFUL

BUFFALO, March 9.—Broader in scope, better in exhibits, and more beautiful from the artistic viewpoint, the sixth annual automobile exhibition of the Automobile Club of Buffalo and the Automobile Trade Association opened in Convention Hall to-night under most auspicious circumstances. If the tremendous crowd which attended to-night is to be accepted as a criterion of the week, the automobile show of 1908 will go down in history as a success from the commercial, financial and social viewpoint. President Frank B. Hower of the Automobile Club, President John A. Cramer of the Automobile Trade Association, and Secretary D. H. Lewis of both organizations, were unanimous in their expressions of satisfaction over the arrangements and the prospects for the show during the balance of the week. Previous automobile shows held in Convention Hall have opened in the morning of the first day of the exhibition, but owing to the inability of the management to obtain possession of the auditorium until Sunday afternoon, it was impossible to finish the decorative work before this afternoon.

In brilliancy and artistic effect, the decorations surpass any previous exhibition ever attempted locally. The designer was Albert Hutter, and he reached the acme of decorative perfection. The decorations are simply magnificent, and the crowds, upon entering the hall, expressed admiration audibly. Band concerts will be held every afternoon and evening by the 65th Regiment Band.

Automobiles of every make and description are on exhibition. Trim roadsters, big touring cars, neat runabouts, stately landaulets and limousines and commercial wagons and trucks are shown. One of the first exhibits that greet the eyes of the admiring throngs is that of the George N. Pierce Company, which faces the main entrance. The Great Arrow is to be seen here, fresh from the factory and complete. There are big sixes and little sixes, Great Arrow 60-horsepower and Great Arrow 40-horsepower, and others.

Close by is the E. R. Thomas exhibit, continuously surrounded by an admiring crowd. Cars ranging from the little 16-20-horsepower town-car to the big six-cylinder flyer, which is the largest and most powerful automobile made in America, are displayed. The Thomas Company has nine different styles of cars on four styles of chassis. There are three Thomas Detroit cars at the show.

Three finished vehicles and a chassis composed the exhibit of the Babcock Electric Carriage Company. The concern also manufactures three other styles of vehicle. The chassis shown is the same as that on which the victoria and the coupe bodies are placed.

Diamond tires are exhibited by the Diamond Rubber Company. There are thirty-five exhibitors at the show.

Boulevard Day to Be a Notable Local Event.

Thursday will be Boulevard day, when the admission price will be one dollar, and all receipts turned into a fund for the Niagara Falls boulevard. All the automobile manufacturers and agencies are booming Boulevard day, as everybody owning an automobile wants to see the much needed Niagara Falls boulevard completed.

The New York State Automobile Association will meet at the Automobile Club rooms on Thursday, and, after a dinner at the Buffalo Club, the directors will attend the automobile show and will thus contribute to the boulevard fund.

The list of exhibitors includes the following:

Maxwell-Briscoe Buffalo Co., Co-operative Auto Co., E. R. Thomas Motor Co., Poppenberg Auto. Co., Lewis & Linn, Brunn Carriage Mfg. Co., J. A. Cramer, Babcock Electric Carriage Co., Geo. N. Pierce Co., Imperial Motor Co., Buffalo Automobile Exch., Centaur Motor Co., E. E. Denniston, United Spring Co., American Leatherette Co., Jaynes Auto. Supply Co., Empire State Tire Co., Chief Mfg. Co., Meyer Carriage Co., Jas. G. Barclay, Iroquois Rubber Co., Walter Hayes, John W. Frey, Buffalo Motor Car Co., D. H. Lewis, Knoll & Turgeon, Neal, Clark & Neal Co., C. E. Miller, W. F. Kendt, Harry Brainard, Harris E. Newton, Louis Engel, Jr., Model Auto. Co., W. F. Poison, International Acheson Graphite Co.

'FRISCO'S SHOW NOTABLY CONDUCTED BY WOMAN'S CLUB

SAN FRANCISCO, March 4.—On the morning of March 2, San Francisco witnessed its first decorated automobile parade. It was the occasion of the opening of the second automobile show, to be held in this city, which is under the auspices of the California Woman's Automobile Club. Shortly before 9 o'clock, one of the heaviest showers of the rainy season fell, and much trepidation was felt for the success of the opening event, but about 10 o'clock the clouds broke away and the sunshine smiled on the assembling cars.

It was a few minutes after eleven, however, when the marshal, Mrs. L. E. Morrill, in her beautifully decorated Franklin touring car, led the long line from the rendezvous at the head of Van Ness avenue. Preceding the car of the marshal were two large Thomas cars, filled with members of Bennett's band. Following the Franklin came the artistically decorated Maxwell runabout of the president of the California Woman's Automobile Club. The car was a mass of big yellow chrysanthemums and blue cornflowers, these being the colors of the organization. With Mrs. Frederick J. Linz, the president, was Mrs. Abbie Krebs, the vice-president. Mrs. Robert Christy, secretary of the club, followed next in a beautifully decorated Elmore touring car. Mrs. Christy was accompanied by a party of friends, composed mainly of members of the club. A big Thomas flyer was seen in the line of march, heavily draped in "Old Glory,"

which sent a thrill of patriotism through the hearts of the spectators as it proudly swept up the street. Another car which brought a cheer from the crowds on the sidewalk was a Maxwell touring car, so decorated as to represent a man-of-war, at the wheel of which sat a sailor, and in the tonneau Goddess of Liberty rode. This was awarded the second prize, as being the most novel and cleverly carried out design.

The winner of the first prize, Mrs. J. M. Etienne's White steamer, was completely covered in pink and white carnations, and gold butterflies and fleur-des-lis were sprinkled over the canopy of color, and a huge gilt sphere hung in the center. Mrs. Etienne had as her guests a party of women friends, all of whom were gowned in pink and white. This clever motorist drove her car and excited many admiring remarks. At the Coliseum, the judges awarded the prizes: the first, \$75, to Mrs. J. M. Etienne, and the second prize, \$25, to the Maxwell "man-of-war."

In the evening at 8 o'clock the doors of the Coliseum were thrown open to receive those who had been in the evening parade, which was even larger than the morning, and to the hundreds who had come out on the cars to witness the event. Mrs. Fred J. Linz introduced W. Parker Lyons, mayor of Fresno, who formally opened the exhibition, and after a few words of congratulation to the members of the California Woman's Automobile Club, introduced the speaker

of the evening, Wu Ting Fang, Chinese Ambassador to the United States, who was en route to Washington. His Excellency was very happy in his remarks, stating that he was glad the fair sex had achieved what the men in the trade had failed to do, and showed great interest in the exhibits.

Results of the Hill-climbing.

Tuesday afternoon was devoted to the first of the hill-climbs, the course lying from the front of the Coliseum to the summit of Buena Vista Heights, which is one of the finest courses for such an event for some miles around, having a number of quite perceptible grades and sharp turns, on a gradual rise.

The first event, for runabouts, was won by a Maxwell driven by Clarence King, a mile and one-eighth, in 2:55.

Second event, for runabouts, value \$1,500 and under—Won by Tourist, driven by Edgar Mason, time, 2:09; second, Auburn, 2:29 4-5, driven by Frank Bryant.

Third event—free-for-all roadsters and runabouts—Won by Stearns, driven by D. A. Bonney, in 1:42; second, Winton, 2:20 2-5, driven by H. L. Owsney.

Tuesday night was under the patronage of the Automobile Club of California, and a large sprinkling of the smart set were in attendance at the show. Mrs. Fred J. Linz presented the winners of the afternoon events with handsome silver and copper cups, appropriately engraved.

The hill-climb for touring cars which was to have taken place on Wednesday had to be postponed on account of the wet weather, and will take place next Saturday.

White Wins in Three Touring Class Events.

SAN FRANCISCO, March 7.—In the hill-climbing contest postponed from last Wednesday owing to rain, a White steamer model L won in the \$2,500 class; a White model K captured first place in the \$3,500 class, and the same car made fastest time in the free-for-all race.

NEWARK'S SUCCESSFUL SHOW WILL REPEAT.

NEWARK, N. J., March 10.—So great was the success of the recent automobile show in Electric Park that it has already been decided to hold a second exhibition in the early months of 1909. W. H. Ellis, secretary of the New Jersey Automobile Trade Association, has applied to the Essex Troop for the use of its new armory, under construction on Roseville avenue. In both size and location, the Essex Troop Armory is superior to Electric Park auditorium, being near the Orange street car line, only a few blocks from the Warren street line and adjacent to the station of the Lackawanna Railroad.

The auditors' accounts show that the profits on the recent show will allow a rebate of nearly 10 per cent. on exhibition rental to all exhibitors. The members of the New Jersey Automobile Trade Association, who cooperate with the New Jersey Automobile and Motor Club in the holding of the show, will receive a larger return. There is a desire on the part of the officials of the automobile club to use the money for the purpose of erecting road and danger signs where the Department of Motor Vehicle Registration and Regulation has neglected to do so.

Prominent among the removals in "automobile row" next month will be the change of J. W. Mason to Halsey street, near Marshall street. The F. L. Boland Company will occupy a new one-story building at Halsey street and Branford place about May 1. With its removal, the company will change its name, F. E. Boland having withdrawn his interest in the concern. The Linkroum Automobile Company, agents in Northern New Jersey for the Lozier car, will remove from Bank street to Halsey street.

HARRISBURG ENTHUSIASTIC FOR SHOW.

HARRISBURG, PA., March 10.—Providing a suitable building can be obtained, an automobile show will be held here next April, under the auspices of the Motor Club of Harrisburg. Members of the club are strongly in favor of the exhibition, and, if suitable accommodations can be secured, it will certainly be held. The club has recently appointed the various working committees for the ensuing year.

PERFECT SCORERS IN MID-PACIFIC CONTEST.

HONOLULU, T. H., Feb. 24.—Nine American automobiles lined up in the second annual competition of the Automobile Club of Hawaii for the Von Hamm-Young Company challenge cup. E. L. King's White steamer, Frank Dillon's Buick, Sidney Jordan's Maxwell, E. Quinn's Buick, and J. Lewis' Franklin were the five to finish the round-the-island run with perfect scores.

TOLEDO OPTIMISTICALLY PREPARES FOR SHOW.

TOLEDO, O., March 9.—Toledo's second annual automobile show will probably be held some time during the latter part of March, very likely in the Coliseum. The show last year was the biggest advertising stunt the local dealers ever participated in, and almost every exhibitor was well repaid for the time and money expended. This year the entire north-western part of Ohio is to be covered with advertising matter, special rates are to be secured on the electric lines and on the steam roads if possible, and the Chamber of Commerce is figuring on joining and making the affair a general boost for the city as well.

Local automobile agents are expecting the best season they have yet had, despite the financial trouble of a short time ago. Prospective purchasers are plenty, and selling agents are now coming forward with advice to prospective purchasers to place orders early, as there is almost sure to be a shortage of cars before the season is ended. This shortage, they say, is due directly to the financial flurry, which caused many manufacturers to curb their operations.

Toledo is in the best possible condition to look after the automobile needs of this section of Ohio. A number of new garages have been equipped since last year, some new agencies have been established, and the stock of cars on exhibition at present is larger than ever before.

A CANADIAN TOWN'S ANSWER TO PROGRESS.

MONTREAL, March 7.—Charlottetown, P. E. I., is the name of the town which must be given the award for excelling in grandmotherly care for the automobile. Recently the Board of Trade of the township passed a resolution calling upon the government to cause all automobiles to be kept at home Sundays, Tuesdays and Fridays. Other regulations fenced in the automobile in such a stringent manner that there was no possibility of it ever overworking itself. A delegation from the Presbyterian church submitted complaints of their congregation that automobiles deterred many people from going to church.

ARRANGEMENTS COMPLETE FOR HOOSIER SHOW.

INDIANAPOLIS, IND., March 10.—All arrangements have been completed for the second annual automobile show, which will be held here March 23-28.

There are now thirty entries in the hill-climbing contest, and almost as many for the obstacle race. Permission has been granted to hold the latter on the North Capitol Avenue boulevard. It has been decided not to hold a formal banquet, but to substitute a smoker and lunch.

NEW THINGS UNCOVERED AT BOSTON SHOW.

(Continued from page 346.)

the car was driven at a speed of 25 miles an hour over this combination of tire-destroyers without any damage resulting. The car was subsequently driven over the nail-studded boards at the slowest possible speed, but the result was equally favorable. The usual type of inner tube is employed in the Zeglen tire, and it does not differ from others in appearance.

Suthergreen Tireholder.—One of the novelties that has to do with the manner of carrying spares, rather than with the tires as such, is the Suthergreen swinging tireholder, made by F. S. Suthergreen, Manchester, Mass. Obstructing the driver's seat with the spare tire has long been one of the objectionable features of the usual method of carrying this indispensable replacement on the car, making it necessary to enter the car from the off side. This new tire holder swings out of the way in exactly the same manner as side entrance, and in addition to facilitating entrance to the driver's seat, it also makes that side of the car readily accessible for cleaning and oiling. The holder is not only made to swing out of the way, but by the removal of a single screw and pin, the holder and its tires may be lifted off completely.

Sterling Spark Plug.—Though its name is similar, the Sterling spark plug for heavy duty, shown for the first time, is not another product of the firm in question, but is made by the Windsor Manufacturing Company, Worcester, Mass. Its chief feature is the employment of a vibrating electrode, which makes it impossible for oil or soot to collect on it, as the motion of the car and the motor cause it to vibrate rapidly. Its design is such that the readjustment of the sparking points is never necessary, as the distance between the surfaces remains unchanged, even though considerable of one of the electrodes happens to burn away. A special core of porcelain reduces the danger of cracking to a minimum.

"Oilzum" and "Cleanzum."—White & Bagley, Worcester, Mass., makers of the euphoniously christened "Oilzum" gas-engine oil, provided a novel treat in the shape of a huge glass-spoked wheel, the spokes being filled with translucent and transparent samples of lubricating oils, which showed to good effect, owing to the illumination placed behind them. Lubricating oils do not lend themselves readily to display purposes, on which account this novel and ingenious method of calling attention to them provoked more than the usual amount of interest. The same firm also showed the cleaning compound, which they have christened "Cleanzum," in an attractive manner.

"Boston" Acetylene Gas Tanks.—These tanks are newcomers, though they are the production of men of long experience in the business, George S. Atwater, who has been making bicycle and auto lamps and generators for a decade past, being the manager of the company, which is known as the Boston Autolight Company, with headquarters at 751 Boylston street. The tanks measure 6 by 24 inches, and are highly finished in copper or nickel, with bands to correspond. Their capacity is 60 cubic feet of gas, and they list at \$35, the price of recharging being \$2.

Anderson Glass Spark Plug.—An ignition novelty that is otherwise well known but which made its first appearance at a show in Boston this week, is the Anderson glass spark plug, or, as the makers call it, a "window" to the engine. It consists of glass pyro-electric welded directly to steel, and when in place in the cylinder the character of the spark may be noted by merely looking down on the top of the plug. It is made in a number of sizes and special styles in both metric and iron pipe threads. These plugs are made by the Anderson Spark Plug Company, Washington, D. C.

"Valgrinok."—An entirely newcomer is the National Valgrinok Company, 116 Bedford street, Boston, Mass., a firm that is placing on the market a special abrasive compound

This Big New England Factory Was Well Represented.

A Representative Trio that Was Capably Staged.

The Packard and Cadillac Showed Complete Lines.

Atlas, Baker Electric, Springfield—Renault, Next Stand.

Truffault-Hartford Showed an Imposing List of Users.

under the title of "Valgrinok." It is ready mixed, in the shape of a paste, and three grades, coarse, medium and fine, and is packed in a box. It is guaranteed not to dry up or shrink, and is designed to be applied with gasoline, oil or kerosene.

Kenney's Non-carbon Oil and Olivine Compound.—These new articles are made by the F. Kenney Manufacturing Company, 360-368 Dorchester avenue, Boston, and were shown at the stand of the Gordon Automobile Supply Company. Harry Eisner, who is manager of the Gordon Company, has control of the marketing of these lines, which includes, in addition to those mentioned above, Kenney's non-fluid grease, liquid metal polish, and a new hand soap. The Olivine is a non-alkaline compound for washing automobiles.

Atlantic Brand of Oils and Greases.—One of the new entrants into the field of automobile lubricants is the Atlantic brand of oils and greases, which are made by the Atlantic Refining Company, Cleveland, O., who are showing in the New England territory for the first time. They make a number of different grades for the various special uses about an automobile.

Smith "One-lock" Adjustable Reamers.—Smith "one-lock" adjustable reamers, the blades of which are ground with a radial clearance from the cutting edges. These reamers are made from 3-4 inch to 6 3-4 inches in diameter, and are supplied with either carbon or high steel blades.

Ball-bearing Tire.—Another novelty in this field is the Ball-bearing tire, made by the Ball-bearing Tire Company, 159 Avon street, Providence, R. I. As will be apparent from the accompanying longitudinal and cross sectional views shown

herewith, the construction of this tire is, in some respects, along the same lines as the familiar standard types. The shoe is composed of various layers of rubber and fabric vulcanized together, and an inner tube is employed. But between this inner tube and the shoe are placed two continuous strips of sectional molded rubber with a series of circular openings, as shown by the longitudinal view. These holes are filled with permanently inflated rubber balls, similar in construction to the inner tube, and from which the tire takes its name. As these balls and their holder are placed between the shoe and the inner tube, anything penetrating the former must pass through them before reaching it, thus making the tire practically puncture proof. A nail or other sharp object going through the shoe of the tire could not deflate more than one of the balls, and the loss of resiliency

Sectional Views Showing New Ball Bearing Tire.

caused by this would be so small as to be unnoticeable. In fact, several of the balls at different parts of the tire could be punctured before the effect would be noticed, and a little extra air pressure on the inner tube proper would compensate for this, until the balls could be removed and repaired, an operation practically similar in every respect to taking out a tube for the same purpose.

Standard Speedometer.—Among the 1908 newcomers is a speedometer, known as the "Standard," which is being manufactured and marketed by the Parker Manufacturing Company, Boston, a firm that has made a specialty of high-class instruments for many years past. As will be apparent from the accompanying illustration, the mechanism of the new speed recorder is of the centrifugal type, but is extremely simple and compact, having but a minimum number of parts. It is operated by a train of gearing direct from the governor weights to the indicating hand, without the intervention of cams or levers, which are lacking in its construction. The governor weights are attached to two pivoted gears which revolve together with the main spindle and mesh with a circular rack which is moved lengthwise on a central spindle. This comprises the entire revolving mechanism, and is mounted on a hardened ball bearing. The remainder of the mechanism is stationary, with the gear always in mesh with the revolving circular rack, but is not subjected to any spring pressure. The gears are very accurately made of hardened steel and mesh with bronze, which insures long life. The pointer itself is attached to the upper end of a spindle with a very long bearing, and is operated by the upper train of stationary gears. This construction gives a speedometer of the centrifugal type, with a uniformly spaced dial, without the necessity of employing cams and levers to bring about this result. In other words, the governor weights

Inside View Standard Speedometer.

New Blomstrom Motor with Crankshaft Arranged Vertically.

In the East Gallery of the Main Exhibition Hall Many Houses Well Known in the Trade Made Effective Displays.

move exactly in proportion to the movement of the hand at all speeds. The only springs are those employed on each side of the governor, one of which shows in the illustration. The governor weights are designed to exactly counteract each other, so that vibration has been reduced to a minimum. Another feature of the Standard is that both the speed recording part of the instrument and the odometer operate whether the car is running forward or backward, the latter adding to the mileage just as if going forward. The calibrating of the dials is done with the aid of a special calibrating machine, the process of adjustment being so simple as to practically eliminate any possibility of error. The Standard is made in a number of types, ranging from zero to 40 miles, zero to 60 miles, and zero to 80 miles an hour, including a model with a maximum speed hand.

Accessories of Various Kinds.—In the field of windshields, the Nonpariel Brass Company, Providence, R. I., are newcomers, who show a line of brass and mahogany framed windshields of attractive design and finish, as well as ingenious types of tireholders, robe racks and other brass specialties.

A novelty that attracted no end of attention from the nature of its radical departure from previous standards in this field is the Half-Nelson emergency tire, shown by the Wood Carving Machine Company, Minneapolis, Minn. It is designed to stow away readily in the tool box and yet be ready at any time for an emergency blow-out or puncture placing one of the pneumatics out of commission, and con-

sists of a number of sections of what is practically a solid rubber tire of the same size as the pneumatic it replaces. These sections are put on the rim one after the other and hooked together, the whole being tightened up by a turnbuckle arrangement.

The Draper Auto Robe Company, Canton, Mass., shows a complete assortment of all kinds of robes specially designed for automobile use, including a wide range of patterns in attractive styles.

Shove & Gage Company, Inc., Providence, R. I., is on the market with a new brand of polishes, namely, the U-Auto polish and the Shine Bright. An effective display of the same is made in the accessories department.

Two New Motors.—There has seldom, if ever, been a Boston show that did not bring to light one or more radically different novelties in the shape of motor design, and the appearance of the Blomstrom motor, shown in the cut on the opposite page, is sufficient evidence that the present function has maintained traditions. This motor is of the two-cylinder horizontal opposed, four-cycle type, but instead of being placed either transversely or longitudinally under the body, it is arranged lengthwise under the bonnet with its crankshaft vertical, in which respect it differs entirely from any arrangement of the power-plant of an automobile ever attempted. Upon a little consideration, it will be seen that this placing holds numerous advantages, particularly where the flywheel is utilized as one of the members of a friction transmission, as is the case here. As will be evident from the

How the Main Floor and West Gallery Looked to the Observer from the Southeast Corner of the Main Building.

photo, this placing not only permits of a long stroke motor of this type being employed under the bonnet, but renders every one of the small parts particularly accessible, the timer, force-feed oiler and carbureter all being in plain view and easy reach. In addition to its other advantages, this arrangement also solves the problem of overcoming the detrimental effects of gyroscopic forces set up by the heavy flywheel revolving at high speed.

The show is also responsible for the appearance of a rotary internal combustion motor, known as the "American." The rotor is elliptical in shape and is water-cooled, as is also every other part of the motor coming in contact with the hot gases. The explosion chamber is so designed that an explosion takes place on different sides of the rotor alternately, two exhaust outlets being provided.

TRYING TO ARRANGE MAXWELL STANLEY RACE.

Boston, March 10.—At a meeting to-day at the clubhouse of the Bay State Automobile Association arrangements were partially made for the Maxwell-Stanley challenge race for the Sir Thomas Dewar trophy. Present at the session were Benjamin Briscoe and J. D. Maxwell, and F. E. Stanley and F. O. Stanley, with Alfred Reeves, H. L. Bowden, J. C. Kerrison and Howard Reynolds as disinterested parties. It is proposed to change the conditions of the trophy so as to permit time trials instead of a race, owing to the great danger at the very high rate of speed assured. The event may be made open and Louis Ross may enter a car. As to where the event will take place, there seems to be considerable doubt. It is proposed that a 3-mile special cement course, 80 feet wide, be built by the manufacturers. Mr. Briscoe will learn if the Long Island Motor Parkway will be available for the purpose. Many consider that the parkway would be an ideal course for the contest, and it is quite likely that satisfactory arrangements can be made with the management for its use.

Henry B. Joy, president of the Packard Motor Car Company, and M. J. Budlong, recently appointed assistant manager, were at the show yesterday and to-day they are at Hartford, Conn. Their presence there has revived the rumor that the Packard company may secure the old plant of the Electric Vehicle Company.

AUTOISTS ASSEMBLED TO-DAY AT WASHINGTON.

WASHINGTON, D. C., March 12.—Delegates from the various State associations of the American Automobile Association to-day are in Washington, under the leadership of President William H. Hotchkiss and Chairman Charles T. Terry, of the Legislative Board, for the purpose of appearing at the hearing before a sub-committee of the Judiciary Committee of the House of Representatives, to present arguments in favor of the Federal Registration bill, fathered by the national automobile organization. A conference of delegates took place last night at the New Willard Hotel.

NEW YORK ASSOCIATION MEETS AT BUFFALO.

BUFFALO, N. Y., March 12.—The New York State Automobile Association of the American Automobile Association is to-day holding its annual meeting in Buffalo, with President Oliver A. Quayle presiding. To-night the delegates will be entertained at dinner at the Buffalo Club by the Automobile Club of Buffalo, and afterwards will visit the automobile show. To-night is society night. There is talk of re-electing President Quayle, whose work as chairman of the legislative committee has been exceptionally successful.

FORTIETH CLUB FOR N. Y. STATE ASS'N.

MOUNT VERNON, N. Y., March 10.—The Automobile Club of Mount Vernon, recently formed with a charter membership of fifty, has decided to become affiliated with the State Association of the A. A. A., making the fortieth club in the State of New York connected with the national body. Membership in the club is limited to automobilists in Mount Vernon and vicinity. It is anticipated that the century mark will be reached before June.

QUAKERS WANT REASONABLE USE OF GRIPS.

PHILADELPHIA, March 10.—Thursday of last week representatives of the local automobile clubs appeared before the Fairmount Park Commission to protest against the proposed ordinance restricting use of tire chain grips on the park roads. The autoists desire to use grips when the roads are muddy or slippery. The committee reserved its decision.

A Corner of the Second Floor, Where the Display of Accessories Was the Magnet That Attracted Many Visitors.

THE PERFECTION OF AUTOMOBILE IGNITION.

(Continued from page 353.)

whether the engine is running 100 or 2,000 revolutions, and it should respond more rapidly at high speeds than at low, but it is apparently impossible to make such a magnetically operated make-and-break in the form of a vibrator. The instrument for demonstrating this advance spark theory consists of a model of a gas engine with its cylinder and piston, connecting rod and crank, but secured to the crank pin is a small pointer *K*, which rotates within a metal ring *L*, clearing it about 1-4 inch. The wires from the secondary of the spark coil are connected to the insulated metal ring *L*, and to the crank and pointer *K*, so that the spark will jump from the pointer *K* to the ring *L* while the engine is in operation. We now set the timer in such a position that in turning over the engine slowly by hand in the direction shown by the dotted-lined crank, we will get a spark when the crank is at the point of maximum compression, as shown in the diagram. If the engine is now speeded to 1,000 r.p.m., without moving the timer, we would find the spark jumping across at *B*, or, in other words, it would be 90 degrees late. This lateness of the spark is entirely due to the lag of the vibrator and the magnetic lag of the iron core, and we must advance the timer an equivalent amount to balance up the two. By varying the speed of the engine, the spark moves from the position *A*¹ to *B*¹. My object in designing this instrument was to prove that the ignition in a gas engine should take place at the highest point of compression, and it approximately does so when the engine develops greatest power, also that time required to ignite charge is small and requires little advance.

THE NEW SCHEBLER GASOLINE FILTER.

Every autoist who has had the slightest experience soon realizes the importance of preventing water, dirt or other foreign matter of whatever nature from reaching the nozzle of the carbureter, and he also realizes, sooner or later, that even the most painstaking precautions are not always sufficient to accomplish this. There must be a last line of defense, and this is to be found at or near the carbureter itself. The method of doing this is clearly illustrated by the

Cross Section of the New Schebler Gasoline Filter.

accompanying line sketch showing the Schebler strainer in cross section. Its arrangement is such that the gasoline cannot reach the carbureter without first passing through the fine mesh screen and gauze.

The bowl is so designed that the heavier particles of dirt and all water will collect there, the drain cock at the bottom permitting their escape. To facilitate the removal of matter that cannot escape through the cock, the bowl is made removable. When the gauze becomes dirty, the bowl and lower half of the entrance chamber may be instantly removed, rendering the screen perfectly accessible. The Schebler strainer is fitted with a bracket for attaching to a support, and should be connected so that the gasoline flows in the direction indicated by the arrows.

ALLEN-KINGSTON NOT INVOLVED IN FAILURE.

The New York Car and Trucking Company, of which Orlando F. Thomas was president, is now in the hands of an official receiver. The company was incorporated under the laws of New Jersey, May 5, 1906, with a capital stock of \$2,500,000, its works being at Kingston, N. Y. It succeeded the bankrupt Peckham Company as manufacturers of car trucks and automobiles. Though a portion of the works was devoted to the construction of the Allen-Kingston car, the Allen-Kingston Motor Car Company is financially independent of the bankrupt concern, and, according to the statement of Walter C. Allen, its president, will be in no way affected by the reverse. That portion of the works devoted to automobile construction will be bought from the receivers or a separate factory will be secured.

The assets of the New York Car and Truck Company are declared to be about \$75,000. Among the creditors are: Harry J. Schnell, \$61,500, for loans; Carl Coonley, \$5,000, loans, and Colby M. Chester, \$1,768, for merchandise. Judge Holt has authorized the receiver to continue business twenty days.

PLAN TO REORGANIZE RELIANCE COMPANY.

LANSING, MICH., March 2.—It is expected that the plant of the Reliance Motor Car Company of this city, which has now been shut down for some time, will shortly resume operations, as capitalists interested in the Reo and Olds plants have advanced \$100,000 to put the company on its feet again. Victor N. Gurney, of Detroit, has been appointed receiver, pending the reorganization which is now under way. It is reported that all creditors will be paid in full. The company was incorporated in 1904 with a capital of \$400,000. Its officers are: President, Fred. O. Paige; vice-president, J. M. Ulkey; secretary, J. B. Corliss; treasurer and general manager, E. W. Gans; sales-manager, F. L. Loomis; engineer and superintendent, H. A. Wilcox. The company was authorized to issue \$150,000 in bonds, of which \$130,000 were sold. The Union Trust Company was a trustee under the mortgage to secure the bonds and the receiver has been appointed on its petition.

DARRACQ AUTO COMPANY IN RECEIVER'S HANDS.

A petition in bankruptcy has been filed against the Darracq Motor Car Company, of 1989 Broadway, incorporated January 12, 1906, with a capital stock of \$100,000, reduced to \$50,000 on April 6, 1906. A few days ago, E. Lamberjack & Co. obtained a judgment against the company for \$2,088 for tires, execution of which was issued by the Sheriff. Judge Holt, of the United States District Court, appointed Lindsay Russell receiver, with a bond of \$50,000. The company has automobiles valued at \$75,000, separate parts and accessories, \$18,000, and machinery and tools valued at several thousand dollars. Liabilities are declared to be \$100,000. G. W. McWilliams was president; C. D. Wilder, treasurer, and Ben Wood, secretary.

CONCERNING POPE INDIANAPOLIS PLANT.

INDIANAPOLIS, IND., March 10.—Although it cannot be confirmed, there is a strong rumor that local capitalists are organizing a stock company to take over the Waverly plant of the Pope Motor Car Company.

The rumor connects two men who have been with the local automobile industry since its incipiency, as the promoters of the company. However, neither are willing to make a definite statement at this time, until the matter has developed further.

Electric automobiles are manufactured in the local Pope plant exclusively, and it is understood that the new company would push the commercial vehicle end of the business especially.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

An accidental use of the emergency brake put an end to the Franklin non-stop run after the 28-horsepower car had run for 18 days 8 hours 50 minutes. The end of the test came at Cincinnati, after journeys in the States of New York, Ohio, Indiana and Kentucky.

Owing to an error in transcription, the fuel consumption of the 45-horsepower, 7-passenger Lozier in the Long Island economy test was stated as 27.75 gallons of gasoline, instead of 25.75 gallons. Total distance, according to the indicators of a majority of the cars, was 234 miles, which gives an average for the Lozier of over nine miles to the gallon with seven passengers, hood, full touring equipment and spare tires.

An excellent record was made by Continental tires in the recent Ormond-Daytona races. The 100-mile race for the Minneapolis International Championship trophy, the 160-mile event for stock cars, and the 288-mile event for the Automobile Club of America Cup, were all won on Continentals. In this latter event a world's record of 300 miles in 233 minutes 44 seconds was made; the makers feel justly proud of the performance. Many important racing events in Europe for the past year or two have been won on Continentals and a large number of racing cars to be used in America this year are also fitted with them.

Following up its aggressive campaign against manufacturers who have been making and marketing lamps that are colorable imitations of the Rushmore flare front headlights and searchlights, the Rushmore Dynamo Works, Plainfield, N. J., have recently extended their efforts to take in the jobbers and have obtained injunctions against several dealers in New York City within the past week or two. This is in addition to the injunction issued against the Manhattan Lamp Works, the latter having been the defendant in the test case brought to establish the claim in the United States Circuit Court. This injunction has been made permanent.

The announcement of the classes in the hill-climbing competitions to be held in connection with the New York City automobile carnival during the first week in April does not meet with the approval of George W. Bennett, manager of the metropolitan branch of the White Company. There are six events restricted to gasoline cars of various prices, one for steam cars, one for electric, and one free-for-all, thus limiting the White cars to two events, that for steam cars only, and the free-for-all. Mr. Bennett claims that such a distinction is unfair, and that his cars should be admitted in the price classification, stating that the White cars are in direct competition with gasoline cars of equal price, and that to bar them from the competition is unsportsmanlike.

RECENT TRADE CHANGES.

The Diamond Rubber Company's branch at Pittsburg, Pa., has been moved to a fine new store specially fitted up for its occupancy at 6122 Center street, East End, that city.

The Morse garage at Lenox, Mass., has been leased to Oscar R. Hutchinson, who will carry on the business of the late

Thomas S. Morse, who established the business. Mr. Hutchinson will handle the Pope line of cars and carry a large line of sundries. Several improvements will be made in the garage and repair shop to handle the steadily increasing business.

NEW AGENCIES ESTABLISHED.

The Simplex Motor Company, of New York, has opened a Boston salesroom at 173 Huntington avenue, that city.

The Blue Ribbon Auto and Garage Company, Bridgeport, Conn., has been appointed Lozier agent for the section of Fairfield county east of Green's Farms and North Wilton.

The Northern Motor Car Company during the past ten days has placed the following agencies: H. M. Jarboe, Carrollton, Mo.; Bert Nelson, Bennington, Kan.; W. H. Thompson, Junction City, Kan.; Colonial Motor Car Company, Springfield, Mo.; White Garage, Oakland, Cal.

The Hamilton-Kull Company has been formed and begun operations at 1677 Broadway, New York City, as the Eastern distributors for the Aerocar Motor Company of Detroit. Of this company, Douglas Hamilton is treasurer and A. L. Kull is manager. The company is thoroughly equipped to handle the Aerocar throughout the Eastern territory.

PERSONAL TRADE MENTION.

H. W. Doherty, formerly of the Corbin Motor Vehicle Corporation, has been appointed sales manager of the Cameron Car Company, of Beverly, Mass., and will handle the output of the company's Brockton and Beverly factories.

NEW YORK SANCTIONS PARADE.

By the granting of permission from the city authorities to use the streets of New York on the evening of April 7 for a monster parade and street exhibition, the organization of the New York Automobile Trade Association's carnival week has taken a step forward. The parade, which is to be one of the main features of a unique carnival, will counter-march on Broadway, above Fifty-ninth street, the judges' stand being located at some point on upper Broadway, in the park strip between east and west divisions of the street. It is at this point also that the press stand will be erected. Full liberty for individual fancy will be given in the decorated section of the parade, and competition will be stimulated by three prizes to the owners of the three best decorated cars in the procession. In addition, a special prize will be awarded to the owner of the most grotesquely decorated car. In this section no marks of identification will be allowed other than prominently displayed uniform numbers. In the dealers' section, decorations will not be allowed, and advertising will only be permitted to a moderate extent. Racing models and commercial vehicles lent by firms employing them in daily service will add to the completeness of the exhibition.

A price classification will be adopted for the hill climb on Thursday, April 9, the prices starting at \$1,000 and less, and running up through six divisions of one thousand dollars to the highest class, selling at more than \$5,000. One class is provided

for steamers at any price, and another for electric automobiles. A free-for-all, racing or stock class, will also be unfettered by any price limit. An early announcement is expected regarding the place of the hill climb, and will be followed by the sending out of entry blanks to possible contestants.

The board of governors of the Automobile Club of America has voted to postpone the regular Tuesday evening club night of carnival week to Saturday evening, April 11, on which occasion a smoker will be given in the new clubhouse on Fifty-fourth street, west of Broadway, to members of the club and the automobile trade, who will participate in the carnival. The carnival committee will make presentations on this evening of the cups, prizes and trophies won during carnival week. This will include the prizes for the best decorated cars in the parade, which will take place Tuesday evening, and the prizes won in the hill climbing contest, which will be held on Thursday.

SIGNPOSTING OF THE ROAD.

ROCHESTER, N. Y., March 9.—On every public highway entering Rochester, particularly the arteries of automobile travel, there have just been placed a series of signposts similar to the one illustrated. These posts are accurately located, for a distance of twenty-five miles outside of the city, being a mile apart,

and serve not only to test the distance covered, but as a guide to the best roads entering Rochester and how to follow them.

They were placed by the Duffy-McInnerney Company, both Mr. McInnerney, the general manager, and Mr. Campbell, the advertising manager, being enthusiastic motorists. If some store in each large city would "go and do likewise" there would soon be a continuous chain of mile posts all the way across the country.

NEW TRADE PUBLICATIONS.

Catalogue D from the Rapid Motor Vehicle Company, Pontiac, Mich., describes the different types of model D rapid delivery vehicle. The catalogue, which is an excellent piece of typographical work, contains illustrations in black and in colors of mechanical features of the "Rapid" and examples of types of bodies generally used for commercial work.

INFORMATION FOR AUTO USERS

Motor Cycle Lamps and Generators.—The Motor Car Equipment Company, 55 Warren street, New York, among its numerous specialties are making an unusual showing of imported motorcycle

MOTOR CAR EQUIPMENT CO. HEADLIGHTS.

headlights and generators. They are designed particularly for use on bicycles and motorcycles and are very light and compact so as to be conveniently carried on the machine. The lamps are of the flare front type, finished in nickel and have nickel trimmings, so that they make a very attractive appearance. The generators are very simple and compact and are designed to have a capacity of 8 to 10 hours burning with the 1-4-inch burner used in the lamps. Three sizes of lamps and generators are made, two of the flare-front type and one an attractive oval headlight model, the generators holding 1-2, 3-4 and 1 1-3 pounds of carbide respectively.

M. C. E. CO. GENERATOR.

Standard Automatic Lubricator.—The Standard Automatic Lubricator Company, 367-369 Ellicott street, Buffalo, N. Y., manufacture a very extensive line

SECTIONAL VIEW STANDARD LUBRICATOR.

of mechanical oilers particularly designed for automobile and motor boat use. They are made with six different sizes of oil reservoirs, ranging from 2 to 12

pints capacity, and from one to 18 individual feeds. These oilers are designed to be placed either on the dash or under the hood of the car and are so made that they can be driven from the right or left-hand side, either end, the bottom or front of tank, thus making them universally applicable, which is a great advantage where room is limited as under the bonnet of an automobile. The sight feed and adjustments are placed on the front wall of the reservoir, thus permitting the removal of the cover without disturbing any of the pumping mechanism. The oil is drawn into a double-acting pump by the backward stroke of the intake plunger through a small port which is incased in a strainer to prevent the entrance of any foreign matter. On the forward stroke, the plunger closes the port and imprisons the oil in the cylinder, forcing the regulating piston back until it rests against the adjustment stop in regulator screw, then the pressure raises the double ball checks and the amount regulated flows from the drip nozzle.

“The Little Steersman.”—This is a little device that is being manufactured and placed on the market by the Abrams-Mason Company, Chatham, New York, and it is one of those things that hundreds of drivers have been on the lookout for. It consists of a double helical spring designed to be attached to the connecting link of the steering gear and to the forward spring clips at the axle and is intended to relieve the driver of

STEERSMAN DEVICE APPLIED TO CAR.

all physical strain in keeping the wheels in the straight ahead position when traveling over rough and uncertain roads. The tension is so regulated that no extra exertion is required to turn corners, and yet is sufficient to keep the car straight even under extremely adverse conditions, such as the bursting of a front tire when running at speed.

Decarbonizer.—This is an oily substance mixed with chemicals designed to combine with the carbon, and with the aid of the combustion taking place in the cylinder, to volatilize it, in which it readily passes out the exhaust as dense smoke, leaving the cylinder, piston and rings in a perfectly lubricated condition, free from carbon and resinous substances. The process requires about 15 minutes for its completion and the cost is merely nominal. It is guaranteed by the makers to be absolutely harmless when used in connection with gas or gasoline engines. The engine should be hot before using the Decarbonizer, and it is preferable to run it comparatively dry for a few minutes just prior to using it. The General Accumulator & Battery Co., Milwaukee, Wis., are the makers.

Two-Spot Spark Plug.—“Two-Spot by name, two-spot by nature and each spot a concentration of electrical intensity, assuring complete, positive and rapid ignition,” say the makers of this new plug in describing it. As will be evident from the accompanying illustration showing one of these plugs complete, its chief feature consists of the exclusive design of the electrodes which permits the plug to produce two distinct sparks every time the current passes and which increases its factor of reliability by 100 per cent, as but one of the sparks is necessary to ignite the charge, and it is an extremely rare probability for both of the gaps to become short-circuited or sooted up at the same time—this also being prevented by their special construction, which tends to keep them clean and free from oil and soot. This new plug is being made and marketed by the Two-Spot Manufacturing Company, Canastota, N. Y., and is already meeting with considerable favor, especially for marine use.

TWO-SPOT SPARK PLUG.

Mossberg Display Stand.—How to attractively display small tools is a problem with the dealer, and to overcome this the Frank Mossberg Company, Attleboro, Mass., have come to the dealer's aid by bringing out a special display

MOSSBERG'S WRENCH DISPLAY STAND.

stand for effectively showing samples of their extensive line of wrenches, as will be seen by the accompanying illustration. The stand is capable of holding 20 different types and sizes of wrenches. It stands 17 inches in height and has a base 7 inches in diameter. It is finished in bright nickel plate and when mounted full of wrenches makes an attractive counter or window display.

THE AUTOMOBILE

PREPARING FOR SAVANNAH'S GREAT MEET

SAVANNAH, GA., March 17.—Savannah is on the eve of its great auto races, which bid fair to inaugurate in the South a new era in the vogue of the motor-driven vehicle. The automobilists of the North and West are lending their brethren of the South a helping hand in the conduct of what promises to be a series of memorable contests—in fact, the inaugural of a form of motor-car speed competition that will give to a manufacturer his best chance for the demonstration of the speed qualities of his normal product, and to the public a most convincing exploitation of the various makes of stock cars entered.

For the promotion of the races and the truly masterly attention to the details of preparation, and the unstinted liberality in providing an unequaled course for racing, as well as everything for the convenience and safety of both contestants and spectators, practically undivided credit is due the members of the Savannah Automobile Club and of the citizens' committee of the semi-tropical Georgia city. What the experience of the A. A. A. racing and technical boards members and their chosen officials will add to the success of the meet will be demonstrated by the results at the conclusion of the program.

The tom-tomming scribes of the press have not let the general and motoring public forget that there was no Vanderbilt Cup

race last year, nor that the rules for stock car competition roughly outlined by the committee of makers last summer still lay upon the shelf.

The motoring Savannahans believed that they had a fit course, were willing to spend the money to promote the races and, best of all, were able to guarantee the military and police protection demanded by the Racing Board as the *sine qua non* of their cooperation in their promotion of a really national competition. The A. A. A. and the S. A. C. wanted a race, and they got together, and that was all there was to it. The result is that the perfection of the preliminaries promises the best course and the best run races in the history of motoring in this country.

Again, let the credit be given to the Savannahans. They have proven themselves true sportsmen. They have not been out for the almighty dollar. Their first thought has been the success of the race. They have spent their money like true Southern thoroughbreds, and "D——n the expense, Sah!"

These Georgians have higher ambitions, though, in race promotion. Their aim is to demonstrate to the American Automobile Association that they have a more than merely available course for the Vanderbilt Cup race, and that they are capable of affording adequate facilities and preparations for it. They

Pooler in Isotta-Fraschini Returns from Practice Run and Tells Officials of Fine Condition of Course.

Bridge for Trolley Passengers Over the Course.

will surely have to be considered in the award of the course when it comes up for official consideration.

It can be truly said that never have the racing autoists of either continent had supplied them the equal of this 18-mile circuit as a long-distance race course. It is level. It is smooth. It has room for two cars to pass at its narrowest, and for several to drive abreast at its broadest, point. In the run through Thunderbolt and the Isle of Hope, it presents a corkscrew of turns that will well test the skill of the best drivers. It lacks hills utterly. On its stretches, it admits of the ultimate of speed and a pace of almost a mile a minute around its turns. Sustained maximum speed will go far to test engine endurance by way of atoning for the lack of strain hill-climbing would afford. The Savannahans have practically built a race course. They have made sharp turns easy by gradually rounding and elaborately banking them at places even with cement. In easing the corners, they have cut ruthlessly through private property and even front yards, but with the ready acquiescence of the hospitable and sportsmanlike owners. They have rebuilt bridges, so that the planks shall run longitudinally. They have leveled the railroad crossings. They have built bridges across the course for the transfer of trolley passengers. They have refined the entire surface of the circuit. They have established fifteen telephone stations. They have erected a grandstand with 5,000 seats and 65 boxes; provided 50 parking spaces for motor cars; have erected separate judges' and press stands; have shut off the homestretch with an impenetrable wire barrier, and their steamship companies have given autoists such cheap rates for transportation of their cars that a New Yorker may take his machine to Savannah and back for \$15. They have not sought to make a gold mine of their grandstand. Boxes, seating six, are sold for the two days for \$35; seats, with backs, for the two days, for \$2.50, and bench seats at \$1 per day.

One of the Signs that Indicates a Turn Coming.

N. H. Van Sicklen, of Chicago, chairman of the A. A. A. Technical Board, has been here for three weeks, assisting the local committee in its preparations for the race. The vice-chairman of the Technical Board reached here Sunday morning. These two began at once their task of examining the cars as to their compliance with the stock car rules. Fred J. Wagner, official A. A. A. starter, arrived here on Thursday to familiarize himself with the course and the details of the conduct of the race.

On Sunday afternoon, there came from New York, Chairman Jefferson deMont Thompson, Vice-Chairman Frank C. Webb, Lewis R. Speare, Stanford L. Haynes and A. G. Batchelder of the Racing Board, and National Secretary F. H. Elliott. They immediately got in touch with the local committee, going over the course in the afternoon and holding a joint meeting that evening. A considerable contingent of newspaper men from New York and Philadelphia was already on hand.

Dangerous Turn on Isle of Hope that is Banked.

Chairman N. H. VanSicklen, A. A. A. Technical Board, and President Battey, Savannah Automobile Club.

The 180-mile race for cars under 375 cubic inches piston displacement will be started at 10 o'clock Wednesday morning. The candidates on hand are the Automotor Company's 50-horsepower Pennsylvania, L. J. Zendell, driver; the E. R. Thomas 40-horsepower Thomas-Detroit, B. J. May, driver; Apperson 24-horsepower, Herbert Lytle, driver, and a second 40-horsepower Thomas-Detroit, S. B. Lorrimer, driver.

The same day, at two in the afternoon, the 180-mile race for cars over 575 cubic inches piston displacement will be run. But two of the five entrants are here. George Salzman will drive a six-cylinder Thomas Flyer of 70 horsepower, entered by J. F. Kiser, an Atlanta amateur, and Frank Leland, the 45-90-horsepower six-cylinder Stearns, nominated by E. H. Inman, of Atlanta. It is expected that the 60-horsepower Matheson, entered by its maker, which J. B. Ryall will drive, will get here,

but small hope is entertained of the appearance of either the 50-horsepower Gearless, entered by the Gearless Transmission Company, of Rochester, or the 50-horsepower Austin.

The big 360-mile race for the Savannah challenge cup will be started at 10 o'clock Thursday morning. All eight candidates are here. They and their numbers are:

1. Apperson Jackrabbitt, 50-h.p.; Herbert Lytle; Apperson Bros.
2. Isotta Fraschini, 50-h.p.; Louis Strang; J. H. Tyson.
3. American, 50-h.p.; Fred Tone; American Motor Car Co.
4. Lozier, 45-h.p.; Harry Michener; H. A. Lozier.
5. Apperson Jackrabbitt, 50-h.p.; W. R. McCulla, Apperson Bros.
6. Isotta Fraschini, 50-h.p.; Al. Poole; Isotta Fraschini Import Co.
7. Stearns 4-cylinder, 30-60-h.p.; Frank Leland; Ross Guerrard.
8. Acme 6-cylinder, 45-h.p.; M. A. Neusteter; Acme Motor Car Co.

Anent the drawing for numbers for this race, there hangs a tale. Edgar Apperson claimed that he had made his entries, and that they were accepted with the understanding that they should be started, respectively, first and last. Though this was clearly against all precedent and contrary to the conditions named on the entry blanks, the other entrants consented, in view of the Apperson's having made the initial entries to the meet to one of their cars starting first, but refused flatly to permit the other to wind up the procession.

In the light runabout class, those with piston displacement of less than 375 cubic inches, excellent sport is looked for. In this are two Thomas-Detroit roadsters, colored blue and designated the "Blue Birds"; a Pennsylvania, an Apperson, a Premier and a Cleveland. Of this group, the Pennsylvania is very fast, having been credited with being timed at as high as a 72-mile gait on the grand stretch.

In the 360-mile race, the eight starters are all on hand, and are doing daily work on the course. In checking over all of these cars, the Technical Board took the measure of the wheelbase, wheels, tires, cylinders, radiators, brakes, frame and springs, and inspected the carburetion, ignition, lubrication, cooling and other parts. Calipers and straight edges were in constant use.

Chairman N. H. Van Sicklen and Vice-Chairman David Beecroft were busy all day Monday inspecting the many competing cars and checking over the various measurements of them, to insure that nothing but stock constructions were allowed. In this little trouble was met with, the majority of the cars carrying every ear mark of the stock machine. Not a little care was taken on the two Isotta Fraschini machines, that have every line of a racing machine. However, the catalogues from Italy show them to be of stock lines, the company having brought out a special line of fast roadster cars.

The six-cylinder Thomas was compelled to take off a 29-gallon cylindrical gasoline tank that was mounted crosswise behind the seat, and to use instead the regulation tank under the seat. The Lozier was ordered to use but one of its 5-gallon oil tanks carried lengthwise on the chassis; one of the Thomas Forty machines had its spring wrapped, which wrapping was removed, but otherwise nothing out of the regular was met with. It is most commendable to think that the makers have taken stock jobs off the shipping room floor and have not tried to win a victory by unfair means.

In the race for cars with a piston displacement of over 575 cubic inches, the probable starters are Thomas and Stearns, the Austin, Matheson, and Gearless not having arrived. The Thomas will start first, and Leland with the Stearns will follow a minute later. Both of these cars are speedy and the result of their meeting is awaited with great interest.

Apperson and Thomas Win First Day's Events.

SAVANNAH, GA., March 18.—Herbert Lytle, driving the 24-horsepower Apperson stock runabout, crossed the line a winner in the 180-mile race for four-cylinder stock runabouts having a maximum piston displacement of 375 cubic inches, which was the opening event of the meet. His time was 3:35:41, the last lap being made in 21:19, while his average speed was about 53 miles an hour. S. B. Lorrimer, in the Thomas Detroit 40-horsepower *Bluebird*, was called off at the end of the ninth lap, having covered 162 miles in 3:36:58, a combination of tire and carbureter

Two Six-cylinder Candidates—Stearns and Thomas.

trouble having caused the delay and the heavy loss of time.

Beautiful weather was vouchsafed for the curtain-raiser and fully 2,000 spectators occupied the grandstand, which was draped with the national colors and the Three A's banner. The race for runabouts, which was first on the program, originally had four entries, but just before the start word came that the Thomas Detroit, which R. J. May was to drive, had blown out

The American Entry, with Driver Tone at Wheel.

a cylinder head. The trio that started was composed of the 50-horsepower Pennsylvania, driven by L. J. Zengell, which was sent away promptly at 10 o'clock; the Apperson Brothers' 24-horsepower Apperson, driven by Herbert Lytle, which got away at 10:06, and the E. R. Thomas Detroit Company's 40-horsepower Thomas, driven by S. D. Lorrimer, that crossed the line at 10:10. All of the cars got away without hindrance.

Pilot Michener at the Wheel of the Lozier.

Mr. Apperson and Secretary Solomon, Savannah A. C.

The Pennsylvania Entry, with Driver Tenck in Command.

The Pennsylvania was looked upon as a general favorite and its performance on the first round verified this opinion, as it completed the lap in 18:54, the Apperson following in 20:29, and the Thomas Detroit in 23:45, actual time. These figures had scarcely been posted when it was announced that the Pennsylvania was out of the race with a broken axle. It was learned later that the trouble lay in the clutch. Carbureter troubles soon began to delay the Thomas, and the Apperson gained steadily, passing Lorrimer in the fifth lap, then stopping for gasoline. A stop was made later to change the spark plugs, these being the only delays, as the Apperson was fortunate enough to encounter no tire trouble whatever.

In the third lap the Thomas lost a tire, so that when the Apperson again entered the running the cars were soon close together and made an exciting race of it, being less than two furlongs apart until the end of the eighth lap, when Lorrimer stopped in front of the grandstand to make carbureter adjustments, losing four minutes. From this point on it was a run-away for the Apperson. Lytle was wildly cheered as he entered the ninth lap, and was given an ovation at the finish, just a few minutes before the Thomas ended its ninth round, and the race was officially declared ended. The progress of the race was as follows:

Laps.	Miles.	Lytle's Time.	Lorrimer's Time.
1	18	20:29	23:45
2	36	40:56	48:06
3	54	1:01:16	1:14:11
4	72	1:21:48	1:41:06
5	90	1:48:30	2:05:03
6	108	2:09:02	2:25:05
7	126	2:29:22	2:49:38
8	144	2:53:26	3:14:47
9	162	3:14:22	3:36:58
10	180	3:35:41	

The running of the Apperson was most consistent, varying between 20 and 21 minutes per round, except on the two rounds in which its stops were made.

Two six-cylinder cars faced the starter in the 180-mile race

for cars of over 575 cubic inches piston displacement—a 70-horsepower Thomas, entered by J. F. Kiser, of Atlanta, and driven by George Salzman, and a 45-90-horsepower Stearns, nominated by E. H. Inman, of Atlanta, and piloted by Frank Leland. It was a splendid race at the start, arousing great enthusiasm. The Stearns completed the first 18-mile circuit in 16:55 and the Thomas in 17:35. On the second round the connecting rod of the Stearns broke, forcing the piston through the crankcase and putting it out of the race.

CADILLAC WON FLORIDA ROAD RACE.

MIAMI, FLA., March 14.—Of the four starters in the road race from Jacksonville, there were but two survivors at the finish. Dr. W. M. Stimson, of Jacksonville, driving a single-cylinder, 10-horsepower Cadillac runabout was the only contestant to finish the 372-mile route laid out by the Cleveland *Pathfinder* in the five days called for by the conditions. A 1905 24-horsepower Peerless, which was chartered to carry the newspaper men and was driven by C. F. Wheeler, arrived here at 4:30 this morning and was awarded second place. Claude Nolan's 10-horsepower, single-cylinder Cadillac runabout was put out of the race yesterday by a broken axle when only 20 miles from here, while Dr. J. H. Pittman, driving a 20-horsepower Buick, gave up at St.

The winner was the only car to get through without a serious mishap to delay it, making the 85-mile run to Ormond in 8:25; the 75 mile stretch to Rock Ledge in 7:28, and a like distance to Fort Pierce in but two minutes more, or 7:30. The 68-mile run to Palm Beach was covered in 10:35, and the remaining 70 miles to Miami in about 4 hours. The Peerless, however, made the 124-mile run from St. Augustine to Rock Ledge in 1 day, 8 hours, 50 minutes, making a new Florida record. It was bogged in a forest near Jupiter for 16 hours the next day and then broke a connecting rod between Palm Beach and Miami.

Driver Price Trying Out His Acme on a Smooth Stretch.

Detroit Thomas Candidates, with Pilots May and Light.

AERONAUTS PROPHECY THE FUTURE OF FLYING

AT their second annual banquet, which was held at the St. Regis Hotel on Saturday evening last, the members of the Aero Club of America were optimistic regarding the future of aeronautical science—in fact, they were confident that its day is already at hand, and that developments will now follow rapidly upon the heels of one another. So rapidly, in fact, that one would hardly be safe in predicting from day to day what will be the outcome of progress a year hence. But the men who know, and they were the ones who spoke, foresee the beginning of an era of aerial navies of both commerce and war within a few years from the present day, and that is thought certain.

"The day is at hand when the balloon is to be supplanted by practical aerial craft. I believe that within the next six months one of our members will produce a dirigible that will astound the world. The opportunity has been provided by the Government, and success, I am confident, will follow. Heretofore, France has led us in this, as with the automobile, but now, I confidently believe, we shall lead the world.

"That's one cup that has gone abroad," continued Mr. Bishop, referring to the victory of the *Pommern* last fall, "but we pledge ourselves that we are going over there and bring it back. We now hope to form all the aero clubs in this country into a federa-

Many Notable Men, Pioneers in the Field of Inventive Genius, Attended the Aero Club of America's Second Annual Banquet.

"We have now truly entered upon the age of the flying-machine," said Alexander Graham Bell, the veteran of telephone fame, and one of the chief speakers of the evening. "We do not have to produce a heavier than air machine. That has been accomplished. We merely have to improve and perfect that machine just as we did with the automobile. And a short ten years ago the automobile that could encompass the distance of a few blocks was hailed as a marvelous piece of mechanism. Now the automobile can traverse a continent. Its history will be reflected in the perfection of the aerial ship."

Cortland Field Bishop, president of the Aero Club of America, and many of the members of the club, enthusiastically applauded Professor Bell's statements, and several of them, among whom were Hudson Maxim, the inventor of smokeless powder; Major George O. Squier and Lieutenant Frank P. Lahm, of the Signal Corps of the United States Army, spoke in a similarly optimistic vein. "Aeronautics is now recognized as an exact science," was President Bishop's text, "and it cannot be denied that this science is about to give the world a new aspect," he asserted.

tion, which, setting aside every attempt at the mercenary, will aim solely to work for the advancement of aeronautics as a sport and a science. And this result we intend to accomplish."

He was followed by Mr. Maxim, who was of the opinion that an aerial navy, far from forming an element of unspeakable slaughter, would be one of the most powerful incentives to peace. "The flying machine has become an actuality," he said. "All that remains to be done is to perfect already existing means and apparatus in order to complete the conquest of the air. The application of aerial craft to war cannot be doubted. Their utilization as a war machine will probably give to aeronautics its strongest stimulant. Some terrible things have been predicted for the flying machine as a war engine. Many a sanguine inventor has said that with the advent of his flying machine, battleships, coast fortifications and cities could be destroyed by dropping dynamite from the air. It is comforting to know that no very great loss of life or property would result from this cause, for the reason that dynamite requires confinement to work very wide destruction. Half a ton of dynamite dropped

upon the four-inch deck of a battleship might kill a few men, wreck some of the superstructure and dent the deck a bit, but the destruction would not be widespread and the crew below would be uninjured.

"But a flying-machine will have great use for scouting purposes," continued Mr. Maxim. "The enemy, however, will have his aerial scouts out, too, and there will be many a tilt in the air. Then it will be that speed will count for much, for the machine able to fly highest and fastest will hold the others at its mercy. These aerial craft will serve to maintain the peace of the world."

Professor Willis S. Moore, chief of the United States Weather Bureau, described experiments now under way to procure accurate information regarding the upper strata of the air. "We have sent up our instruments to a height of four miles and more," he said, "and in time we expect to have them ascend at least six miles. At that altitude, we believe we will find that the air conditions remain unchanged throughout each day." Because of the depressed temperature to be found at high altitudes, Mr. Moore thought that buildings of the future may reach heights

of 1,000 feet and have summer hotels on the roofs, where heat sufferers may find relief by ascending, either in elevators or aerial craft, and dwelt at some length upon this possible development of the not very distant future.

Major Squier and Lieutenant Lahm contented themselves with tracing the creation of the aeronautic division of the War Department, and outlining the steps which led to the placing of contracts for dirigible machines, the first of the American Government's aerial fleet, the pioneer machine of which will be constructed by Captain Thomas S. Baldwin. McCready Sikes, J. W. Kearney, secretary of the Aero Club of St. Louis, and Johnson Sherrick, president of the Aero Club of Ohio, also spoke briefly. The chief feature of the decorations was a miniature balloon, complete in every detail, which was suspended over the table. Among those present were: Robert W. Chambers, Augustus T. Post, Peter Cooper Hewitt, Arthur Iselen, Ernesto G. Fabbri, Lieutenant Maxwell Murray, Lieutenant T. Selfridge, A. Leo Stevens, Albert C. Triaca, R. Stuyvesant Pierrepont, William E. Whitehouse and James W. Osborne.

FEATURES OF AMERICAN RACER FOR GRAND PRIX

THOUGH not in every detail a stock chassis, the Thomas Flyer which Montague Roberts will drive as the sole American representative in the French Grand Prix July 7 is a much nearer approach to the regular factory output than the majority of racers. The French Derby calls for cars of not more than 6.1 inches bore for four-cylinder engines, and of not less than 2,425 pounds total weight; in all other features constructors are absolutely unfettered. The standard Thomas car, known as the 4-60 Flyer, has a four-cylinder motor of 5 1-2 bore by 5 1-2-inch stroke, obviously too small to compete against the 6.1 by 7.08 foreign racers. On the standard engine base, however, it will be possible to fit cylinders of the maximum bore of 6.1 inches, declares F. P. Nehrbas, superintendent of the E. R. Thomas Company, and this will be the only essential in which the racer will differ from the standard 1908 runabout.

In all probability the engine stroke will not be increased, for this could not be done without altering the entire motor design, and the desire of the factory is to remain as close to stock models as possible. Valve arrangements will be identical with those of the 60-horsepower runabout, inlet and exhaust valves being in pockets on opposite sides, operated by separate camshafts. Bosch high tension magneto will be fitted, with possibly an Atwater-Kent spark generator for use in starting up. Lubrication and engine cooling remain unchanged, the former consisting of mechanical six-sight feed oiler and the other of a centrifugal pump, cellular radiator and two fans. Carbureter

will be the Thomas automatic water-jacketed type with auxiliary inlet, the same as is used on the regular output.

Some changes may have to be made in gearing on account of the higher power which the car will develop and also to fit it for the course on which the race will be run. In principle, however, the Grand Prix racer will not differ from the current runabout model. A metallic three-disc clutch will be used, transmission will be of selective sliding gear type, giving four speeds forward and reverse, and final drive will be by side chains. Wheelbase will be 112 1-2 inches. A 36-gallon gasoline tank will be carried in the rear. No decision has yet been made regarding tire equipment for the Grand Prix racer. It is certain, however, that dismountable rims will be employed, the conditions of the race under which every driver has to make all repairs, adjustments, etc., being, in a word, debarred from all outside help—making them essential.

Roberts having returned from the New York-Paris run, work on the car will be pushed ahead rapidly, in order that the racer may be on the course in ample time for the driver to familiarize himself with every turn and grade. No mechanic has yet been selected, the choice, it is declared, resting entirely with Roberts. It is anticipated that the car and its driver will sail for France about the middle of May. Only one racer will be built, but two cars will be sent abroad, the second one to be used in practice work on the course, in order that an unforeseen mishap at the last moment may not ruin the Thomas' chances of competing.

ACTIVE SUMMER PROMISED FOR DETROITERS.

DETROIT, MICH., March 17.—A touch of the real thing in the way of races, endurance contests, economy tests and other stunts is in store for Detroiters, as a result of the action taken by the Detroit Automobile Dealers' Association. This organization, comprising practically all the local retailers, has outlined an ambitious program for the summer. The opener will be a three-day endurance test, not unlike the A. A. A. tour, but shorter. It will be conducted through Michigan alone, and prizes will be awarded those making perfect scores. Following this, there will be other events throughout the summer, calculated to arouse interest in the automobile and demonstrate its ability.

Officers of the Detroit Automobile Dealers' Association for the present year are: President, Alex. I. McLeod; vice-president, J. P. Schneider; secretary, George E. Lane; treasurer, J. H. Brady; directors, the foregoing officers and Charles Grant.

INDIANAPOLIS DEALERS FINALLY ORGANIZE.

INDIANAPOLIS, March 17.—As has been anticipated for some time, local dealers are to form a permanent organization. It will be known as the Indianapolis Automobile Trade Association, and articles of incorporation will be taken out within the next few days. The step was decided upon at a recent meeting of the committee having the coming automobile show in charge. It was recalled that there was no dealers' organization, and that each dealer might be held personally liable for any accidents that might occur that week.

A committee was at once appointed, consisting of Frank Staley, R. I. Eads and C. S. Hicks, to take the matter up and arrange for articles of incorporation. The association in the future will have charge of race meets, shows and contests, and matters of interest to dealers in general will be passed on. The association is expected to benefit the local trade greatly.

SOCIETY OF AUTO ENGINEERS MEET AT THE HUB

THOUGH Boston was down as the meeting place of the first quarterly gathering of the Society of Automobile Engineers this year, one of the chief events of the meeting was the run to Lowell, Mass., for the purpose of inspecting the plant of the Heinze Electric Company, and, incidentally, to partake of a lunch given at the Lowell Country Club, this part of the program having been provided by J. O. Heinze, one of the members. The meeting was opened by President Fay at the Walker Building, Massachusetts Institute of Technology, on Tuesday evening, March 10, with the reading of a paper, entitled, "Perfecting Automobile Ignition," by Mr. Heinze, who supplemented a most interesting talk on automobile ignition by the exhibition of an imposing array of delicate testing instruments of his own invention, with the aid of which he explained the methods he had evolved as the result of a great deal of study, of so standardizing the manufacture of induction coils, that perfect reliance could be placed upon each unit in a coil box having exactly the

At the conclusion of this, the members returned to Lowell, and were first taken through the woodworking plant of the Heinze Electric Company, which is situated on the Merrimac river. Every detail of the various processes involved in converting the rough lumber into the highly finished coil boxes was inspected, and then the cars were again taken for the ride to the main plant, where the electrical work is carried on. This is the building shown in the accompanying photograph. It contains a most complete equipment of automatic machine tools for the production of the numerous small brass parts found on vibrating coils, winding, assembling and testing rooms, a battery of mercury air pumps for the manufacture of X-ray tubes, and a laboratory. The various steps in the building of a coil were followed with great interest, but the *pièce de resistance*, so to speak, was the huge induction coil, capable of producing a spark 50 inches in length. It is the largest of its kind ever built, and in action resembles nothing so much as miniature lightning. The

Members of the Society of Automobile Engineers Upon Their Arrival at the Heinze Electric Company's Plant.

same characteristics. The Heinze analogue for illustrating ignition advance, showing exactly the amount of lag taking place between the time of closing the circuit and the occurrence of the spark in the cylinder, was warmly commended by many of the engineers, who had never had an opportunity of seeing this important phase of coil ignition so clearly demonstrated. The reading of the paper was followed by the usual discussion in the course of which numerous points of interest came out.

The following morning, at 9:30, the members gathered at the headquarters of the Bay State Automobile Association, where cars were waiting to convey them to Lowell. The official car of the day was a White steamer, and was followed by a Locomobile, driven by A. L. Riker; next came a Berliet, handled by B. D. Gray, chief engineer of the American Locomotive Auto Company of Providence, and following it came a Stoddard-Dayton. Harold Brown, in his Peerless runabout, was the official guide and pacemaker, but found another aspirant for the same honors in the shape of a namesake driving an Apperson "Jack-rabbit," and as the result of the competition which arose, the thirty odd miles intervening between Boston and Lowell were covered in little less than an hour and a half, despite the unfavorable condition of a considerable part of the road. J. O. Heinze, in a Marion runabout, met the visitors in Lowell, and piloted them out to the Vesper Country Club, about six miles outside the city, where a luncheon was served to the engineers at Mr. Heinze's invitation and which proved to be a most enjoyable affair.

secondary winding is in small sections, separated by built-up plates of mica about 1-8 inch thick, while the primary and secondary windings are separated by a heavy mica tube. It is operated by a circuit breaker of Mr. Heinze's invention.

The return to Boston was made without incident, except where the official car, carrying President Fay and Secretary Hayward, was concerned. A combination of tire trouble and lack of foresight on the part of the driver in taking water, supplemented by ignorance of the route, made its passengers about an hour late for the dinner given to the engineers at the Bay State Automobile Association's clubrooms, in Dartmouth street. Prof. F. R. Hutton, past president of the A. S. M. E., spoke at length concerning a proposed plan of co-operation by the two societies, which was enthusiastically received, and referred to the Council of the S. A. E. for further action. The regular business meeting followed this, at which the election held at the annual meeting was ratified and the proposed constitution formally adopted. The remaining papers, entitled, "On the Design and Construction of Crankshafts," by P. M. Heldt; "A Multiple Unit Road Train as the Solution of the Heavy Goods Transportation Problem," by Joseph A. Anglada, and "Forgings for Automobile Work," by R. W. Funk, were then read, the discussion in the case of the last two being postponed. It was decided to hold the third annual summer meeting at Detroit on June 25, 26 and 27, in connection with the meeting of the American Society of Mechanical Engineers.

ENTHUSIASM FOR NEW YORK CARNIVAL WEEK INCREASING

PREPARATORY work of a character destined to make the carnival of the New York Automobile Trade Association the finest thing of its kind ever attempted in automobile circles in this country, has been perfected by the committees in charge, and details are practically complete for the opening of carnival week, on April 6. The trade is supporting the event unanimsly, and business houses of all kinds and hotels along the line of march, realizing the importance of the carnival from a business standpoint, have given orders for decorations. A big influx of visitors from out of town is expected.

The parade committee is especially desirous of securing as many cars of 1903 and older as possible. The trade can cooperate in this feature by supplying information regarding the present whereabouts of old cars to R. G. Howell, grand marshal, 1657 Broadway, or Col. K. C. Pardee, chairman parade committee, 317 West Fifty-ninth street.

The special trade run and dinner for Friday afternoon, April 10, will have the Hotel Gramatan, Bronxville, as its objective point. Fuller details, with applications, will be sent to the trade later, for reservations at this dinner.

Judging from the general enthusiasm expressed among members of the trade, the parade will undoubtedly be the biggest feature of the carnival, and will prove a big drawing card with the public. Nearly every one that owns a motor car seems to be anxious to have it in the parade, and it is likely that the committee will have to put a limit on the number of cars in each division of the pageant. Blanks will be issued during the coming week to all persons desiring to enter cars in the parade on the evening of April 7.

The course of the parade has already been decided upon. It will start at Broadway and Fifty-sixth street, in the heart of the automobile district, headed by the cars entered in the Briarcliff

trophy race. The various divisions will form in the cross streets west of Broadway as follows:

On Fifty-sixth street—First division, composed of Briarcliff trophy cars, Vanderbilt Cup cars and the historic section of old cars.

On Fifty-fifth street—Second division, composed of dealers' 1908 models.

On Fifty-fourth street—Third division, composed of decorated automobiles.

On Fifty-fourth street—Fourth division, composed of commercial vehicles.

The parade will go south on Broadway to Twenty-fifth street, thence north on Fifth avenue to Fifty-seventh street, to Broadway, north on Broadway to One Hundred and Tenth street and south on Broadway to Columbus Circle, where the paraders will disband. The judges' stand will be on the park strip on Broadway, north of Seventy-third street.

Full swing will be given to the individual fancy in the third, or decorated division, and handsome prizes will be awarded to the cars most beautifully decorated. A special trophy will be offered for the owner who decorates his car most grotesquely. Various firms along Automobile Row are making preparations to decorate the interiors and exteriors of their salesrooms. Many special features of interest are being worked up by the dealers to attract attention to their places of business.

Fort George Hill has been chosen for the hill-climbing contest, which is to be another feature of the carnival. A permit has been obtained from the city authorities for the holding of the climb, either on April 6 or 8. The grade averages more than 11 per cent., and in places reaches 15 per cent. The entry fee will be \$10 for each event. The cars will be sent up one at a time from the starting point at the Dyckman street subway station.

AMERICAN CARS WELL REPRESENTED AT TORONTO

TORONTO, ONT., March 16.—Preparations are practically complete for the Automobile and Sportsman's Show, which will open at St. Lawrence Arena, this city, March 21, and continue for one week. The show is attracting the attention of American manufacturers, and more of them than ever before

Automobile & Supply Co., Toronto.

DESIGN AND CONSTRUCTION OF CRANKSHAFTS*

By P. M. HELDT. MEMBER SOCIETY OF AUTOMOBILE ENGINEERS

THE crankshaft of the motor of a modern car is at once one of the most expensive single pieces that enter into the whole construction, and a part that requires the greatest skill of the machinist's art for its proper execution. The crankshaft is an old mechanism, having been in use for over a century, on steam-engines, but the problem of the multiple crankshaft, for high-speed internal combustion engines, is a relatively new one. The abolition of the crankshaft in engines is a hobby with numerous inventors, and during the ten years of the writer's connection with the automobile industry, numerous crankless engines have been brought to his attention. I am inclined to think, however, that a principle of construction which has withstood the test of time for over a century must have unusual merits.

In the design of a crankshaft the first requisite is that it must be strong enough to resist or withstand the stresses to which it is subjected in operation. These stresses are of a very variable and complex nature and almost impossible to determine from theoretical considerations alone. Of course, it is only necessary to consider the maximum stresses for any given portion of the shaft. On the crankpin there is evidently a bending stress which is at a maximum at the moment the explosion occurs. The crank arms are subjected to compound stresses, viz., a bending stress in the plane of the crank and a bending stress in a plane at right angles to the crank. To better understand the first of these

Fig. 1.—Illustrating effect of stresses on crank members.

stresses we may consider the crank stationary in the top dead center position; when the explosion occurs, the pin and crank arms will flex, somewhat similarly as when a load is applied to a beam fixedly supported at its two ends. The flexure in actual work is, of course, infinitesimal, but we may obtain an idea of the general shape the parts assume by considering a shaft of very small cross-sections and long members. When such a crank is subjected to a load corresponding in direction to the pressure of explosion, the crank members will assume approximately the form shown in Fig. 1. I have here assumed that the two shaft journals are held rigidly, while the crankpin is capable of bending. This assumption has some justification because the crankpin bearing is often much shorter than the main bearing. This illustration gives a good idea of the localization of stresses at the joint between the crank arms and the main journals. It is at this point that practically all breaks of crankshafts occur. To minimize the danger of breakage liberal fillets should be provided.

The crank arms act as lever arms for turning the shaft and as such are subjected to bending stresses which increase from the joint with the crankpin to the joint with the main journal. The latter is subjected mainly to torsional stresses.

The crankshaft must be designed to withstand these stresses, and yet must be no larger than necessary, because this would mean not only an amount of dead weight would have to be carried, but that—if the journals were of more than the necessary diameter—the friction loss would be greater than need be. In spite of the fact that there are thus two distinct reasons for keeping down the size of the crankshaft, I do not believe that too much peeling here is advisable. It has been said—and I believe is the general opinion among engineers—that every crankshaft breaks in the course of time, its lease of life depending upon the character of its material and the maximum stress regularly sustained at any point. Experiments with so-called

endurance machines have shown that the number of repetitions of stress which a part will withstand is directly dependent upon the value of the stress as compared with the breaking strength of the material; in other words, upon the factor of safety. Now, the aim in crankshaft construction should be to make the maximum unit stress so low that the endurance of the crank equals the normal lease of life of the motor. Breakage of a crankshaft while the motor is still in good working condition will always

Fig. 2.—Five-bearing type of crankshaft.

be regarded by the owner as proof of improper design or poor material, while there is, of course, no advantage in endurance much beyond the normal lease of life of the motor. But this endurance is not subject to exact calculation and it is far better to err on the side of safety in proportioning the crankshaft. This policy of making the shaft considerably heavier than would seem necessary is followed by the German Daimler Company.

In the production of crankshafts a number of entirely different processes are followed. In some of the old style marine and small stationary motors are found crankshafts which are produced from a piece of machinery steel which has a kink put into it by a steam hammer to serve as the crank, and then has the pin and main journals turned up in the lathe. The manufacturers of these motors claim the advantage that in these shafts the grain runs lengthwise of the shaft. This latter point cannot be advanced in favor of the crankshafts used in the majority of modern high-grade, four-cylinder motors. These shafts are made from solid prismatic slabs of metal of the same dimensions as the over-all dimensions of the completed shaft. "Whittling" a shaft out of such a block of metal entails an enormous amount of machine work and comes very expensive, but is thought to be justified by the very superior metal thus obtained in the finished shaft. The "grain" argument in favor of crankshafts forged to shape, as against those turned from solid slabs, has

Fig. 3.—Crankshaft with two throws between bearings.

probably very little weight, because metallurgists are now generally leaning toward the opinion that steel is not fibrous at all, but is naturally of a crystalline structure and as strong in one direction as in another. Many crankshafts of modern engines are made from drop forgings and hydraulic forgings, and the advantages of this method of construction are that it greatly reduces the amount of machine work that must be done upon the shaft. In the case of crankshafts for low-priced cars it is the custom to leave the crank arms of drop forged crankshafts in the rough and only to finish the journals. It is really hard to see what advantage there is in finishing the crank arms, except that a crank so finished looks better, but as the crank of an automobile engine can only be seen when the motor is taken apart for repairs, this feature seems to benefit only the repair man. Of course, it is hardly necessary to add that a crankshaft made from a slab must have its arms machine finished.

The materials most largely used for automobile crankshafts

*Paper read before the Society of Automobile Engineers at Boston.

are carbon steel of from 35 to 50 points carbon, nickel steel, nickel chrome steel and vanadium steel. Formerly it was the custom in France, I understand, to case harden the crankshaft journals and grind them. This treatment undoubtedly improves the bearing properties of the steel. The case hardening process has now been given up and instead the shaft is subjected to a heat treatment. In some cases this treatment consists in raising the shaft to a temperature of about 900 degrees Centigrade, quenching it in oil and then reheating it slowly to 500 degrees Centigrade. This treatment is given the shaft after it has been roughed out, for the reason that it hardens the metal and renders the removal of more material difficult.

The treatment given the best results depends, of course, entirely on the particular grade of steel used, and the subject of the different available steels is so vast that it can be only referred to in passing. Whatever grade of steel is used, however, it is essential that it be derived from very pure ingredients and that the sulphur and phosphorus components be as low as possible.

Perhaps the most interesting phase of crankshaft design to the automobile engineer is that of the proportioning of the parts, from the pressures and stresses developed in the engine on the

Fig. 4.—Three-bearing crankshaft drilled for lubrication.

one hand, and the strength of the material (generally recommended by a metallurgical engineer) on the other.

For the purpose of this discussion we may divide the different single-piece shafts used in automobile engines into four groups, with one, two, three and four throws between main bearings respectively. The first two of these groups are by far the most common; that type with three throws between main bearings has been used on some small experimental triple-cylinder engines, while the last type with four throws between main bearings is now coming into use for taxicab or "block" engines.

It is at once apparent that in a crankshaft with a main bearing between each pair of throws or at both sides of the crank there is little chance for heavy bending stresses to occur, provided the bearings are rigidly supported by the crank chamber or base. In a crankshaft with a double throw between main bearings, the bending moment is already a much more important factor, because of the greater relative distance between supports. In a crankshaft with four throws between the main bearings the bending moments become a factor of extreme importance.

In a crankshaft of the first type the length of the crankpin and main bearings is limited, and for a certain size of cylinder bore and an average compression figure the crankpin must be of a certain diameter if the specific pressure on the bearing surface is not to exceed the maximum permissible value. If both the diameter and the effective length of the pin are made directly proportional to the cylinder bore, the projected area of the pin bearing will be proportional to the piston area and consequently to the maximum pressure that it will have to support. Some years ago I gathered data of the crankshafts of a large number of American, single-cylinder crankshafts, practically all of ordinary carbon steel and made by the drop forging process. I found that the average proportions were:

$$\text{Pin diameter} = .3 \times \text{bore.}$$

$$\text{Pin length} = .42 \times \text{bore.}$$

$$\text{Width of crank arm} = 1.4 \times \text{pin diameter.}$$

$$\text{Thickness of crank arm} = .5 \times \text{pin diameter.}$$

The material used in these shafts had perhaps an average tensile strength of 65,000-70,000 pounds. If alloy steels of 105,000 to 125,000 pounds tensile strength were substituted the proportions could be materially changed. The crankpin could be made

somewhat longer and of smaller diameter, and the arms could be reduced in size in both directions of their cross-sections.

A close calculation of crankshaft dimensions should, of course, take into account both the maximum pressure developed in the cylinder and the tensile strength or elastic limit of the material. It is evident that in a crank with double throws between bearings the crankpins must be larger in diameter than in a crank with only a single throw between the bearings, of the same material and for the same size of cylinder. The long crank arm in the former case also must be considerably heavier than the short crank arms. From comparatively recent data of a considerable number of four-cylinder crankshafts with double throws between main bearings, I have reached the conclusion that in average practice the pin diameter in such cranks is

$$d = .4 \sqrt[4]{\frac{P^2}{S}}$$

where P is the maximum pressure on the piston and S the tensile strength of the crankshaft material. For a crankshaft with only a single throw between main bearings the formula becomes

$$d = .38 \sqrt[4]{\frac{P^2}{S}}$$

The coefficients .4 and .38 may seem to close together that the difference is not worth talking about, but it must be remembered that the strength of a crankpin is proportional to the cube of its diameter, and the former formula gives a pin about 17 per cent. stronger than the latter. The length of the crankpin can be found from the permissible unit bearing pressure and the bearing diameter thus determined. In a crank with two throws between main bearings there is no reason why the bearings should not be made comparatively long, as there is plenty of room, and the unit bearing pressure may be limited to 1,200 pounds per square inch. In the other type of crank the space is limited and the unit pressure on the crankpin bearing surface must be carried somewhat higher, 1,500 pounds per square inch being an average figure.

The proper diameter of the main journals is, of course, the same for all types of crankshafts. The resistance to torsion of the main journal must be proportional to the maximum pressure on the piston and to the length of the stroke. I have found the

Fig. 5.—A variation of the three-bearing type of crankshaft.

following formula to express very closely the average practice in dimensioning the main journals:

$$d = 2.6 \sqrt[3]{\frac{sP}{S}}$$

In proportioning the crank arms it is usual to make the width somewhat greater than the crankpin and main journal diameters in order that it may provide a shoulder for the bearings, the average width being $w = 4/3 \times$ crank-journal diameter. When this width is used the average thickness of short crank arms is given by the formula

$$t = \frac{d^3}{w^2}$$

and that for long crank arms by the formula

$$t = .72 \sqrt[2]{\frac{d^3}{w}}$$

This practice of making the crank arms equal in width to the crankshaft diameter plus about twice the height of the flanges on the ends of the journal sleeves is a heritage from the period

of single-cylinder engines. There can be little doubt that in a crankshaft with two or more throws between main bearings advantages in the way of lightness and strength could be secured by making at least the long arms narrower and of somewhat greater thickness. This idea has been carried out in some crankshafts made of drop forgings and in which the arms remain unfinished. In these shafts the crank arms are forked with seg-

Fig. 6.—Three-bearing crankshaft longitudinally offset.

mental prominences on opposite sides of each journal, so as to form a complete circular shoulder the height of the journal sleeve flange. In shafts finished all over it is, of course, impossible to provide these prominences, but it does not seem at all necessary that there should be a continuous circular shoulder at the end of each journal, as, unless no provision is made to take the end thrust of the clutch up within the clutch itself, there is little end pressure on the bearings of a crankshaft.

Certainly the most striking and daring innovation in crankshaft design is the four-cylinder crankshaft with only two main bearings, as used on a number of "block" motors fitted on taxicabs. When one considers that in a single-cylinder engine the average distance between main bearings is only about seven-eighths of the cylinder bore, while in a four-cylinder "block" engine with only two main crank bearings it is at least four times the cylinder bore, it can easily be realized that the bending moment on the shaft at the moment of explosion is relatively great. Of course, it is possible to make the shaft so heavy that the unit stress will be quite reasonable, but it is desirable to keep the dimensions down, not only because of the saving in weight thus effected, but also because there is less friction loss.

It is hardly likely that a shaft of this type will be made of carbon steel, with its relatively low elastic limit; nickel steel and chrome nickel steel are undoubtedly essential to stand the strains imposed on a crankshaft of this type for a period of time approaching the life of the engine. It is also obvious that with a crankshaft of this kind considerable bending will occur at the moment of explosion, and care must be taken in the design to insure that there can be no localization of strains from this bending. With only two bearings, if plain or parallel bearings were used, they would necessarily have to be of more than the usual length, and the two ends of the shaft would be almost rigidly held, so far as bending is concerned. This would concentrate the strains at the inner ends of the main journals, and the shafts would undoubtedly break at these points in short order. Some form of bearing which permits of some disalignment of the journal portion of the shaft appears to be absolutely necessary. The annular type of ball-bearing fulfills this requirement and seems to be exclusively used for the purpose at present. Some sort of parallel bearing with a spherical seat, as often used on dynamos, might possibly also be made to serve the purpose, but would hardly be as good as the ball-bearing. Localization of strains at the ends of the crankshaft journals is also a serious matter in crankshafts with less than four throws between supports, and probably a majority of all crankshaft breaks occur at these points. That this danger must be guarded against by providing fillets of large radius at the junction of journal and crank arm can be read in almost every article on crankshafts, but is one of those important rules of design that will bear repetition.

One of the illustrations herewith shows the crankshaft of the Delahaye 12/16-horsepower block motor, which is probably typical of this design of crankshaft. In studying the layout of this shaft

it will be observed that it is not in perfect mechanical balance, there being nothing below the center line of the shaft in the drawing to balance the two short crank arms extending upward. It would, of course, be an easy matter to secure counterweights to these outer crank arms, but in the writer's opinion a more advantageous plan would be to increase the cross-section toward the middle of the shaft. The two long crank arms would then be slightly tapered from one end toward the other, and the two middle crankpins would be of larger diameter than the two outer ones. This latter feature, necessitating two different designs of connecting rod bearings, and possibly of connecting rods, would be the reverse of an advantage, but otherwise the construction would have at least two advantages. The bending moment in a structure like this increases from the ends towards the middle, and in order to reduce the unit stress to a minimum, with a given weight of metal, the section must increase from the ends towards the middle. Further, if the two inner crankpins are heavier than the two outer ones, the long crank arms taper from the inner to the outer ones, the shaft might be made to balance perfectly without extra balance-weights.

In connection with the question of balancing four-cylinder crankshafts, the point is sometimes made that if cranks extending in opposite directions from the shaft and located at some distance from one another in the lengthwise direction of the shaft are depended upon to balance or neutralize one another's centrifugal and inertia effects, this can only be accomplished at the expense of internal strains in the shaft, and it is contended that the only proper way to balance a four-cylinder shaft is to provide each short crank arm with a counterweight extending in the opposite direction. This idea is carried out in at least one French engine. The writer believes it to be an illusory refinement, as the increase in weight is a much greater detriment than the strain on the shaft due to the balancing effect of side-wardly displaced opposite cranks.

If the four-cylinder, two-bearing crankshaft should prove a permanent success it would mean an important simplification in engine construction. Doing away with the standards for intermediate bearings, and with these bearings themselves, it would lead to a considerable saving in the weight of the crankcase. The weight of the crankshaft itself would probably be not very much more than that of an equivalent crankshaft of one of the two usual types, because the greater necessary cross-section of the shaft parts would be partly compensated for by the simpler form (fewer members). The saving in the work of

Fig. 7.—The most recent development in crankshaft design.

machining the crankshaft and fitting the bearings would be an important item. It is the writer's belief that for the best distribution of metal in a shaft of this kind the section of the two long arms should be nearly square. As to the ultimate success of this form of crankshaft, only continued experience can tell, and it would be a waste of time to seek to argue this question, as it is probably not so much a question of strength as of weight.

The accompanying cuts illustrate crankshafts of 1907 and 1908 models of American four-cylinder engines, which show a considerable variety in design.

APPARATUS FOR THE STUDY OF AUTO SUSPENSION*

IN repose, the reactions of an automobile on the passenger are the equal and directly opposed result of his weight P . Generally speaking, they are not quite the same while the car is in motion. As the result of the oscillations due to the irregularities of the road, the center of gravity of the passenger describes a curve, more or less erratic, about a line parallel with the surface of the ground traveled over. Let it be assumed, for greater simplicity, that the chassis remains parallel to itself during its movement, designating γ as the value of its acceleration. The resultant of the reactions of the car on the passenger then no

longer constitute a vertical force equal to P and constant, but a variable vertical force as γ , of which the value is:

$$P\left(1 \pm \frac{\gamma}{g}\right), \quad g = 9.8088$$

the \pm sign corresponding to ascending movements of the chassis, and the $-$ sign to descending movements. It will be apparent that these are the cause of the fatigue of the passenger.

Instead of being able to permit his muscles to remain

in repose in a state of tension corresponding to the action of the force P , which is their normal state, he must accommodate them to the state of tension corresponding to the action of the constantly variable force:

$$P\left(1 \pm \frac{\gamma}{g}\right).$$

It will be apparent that the fatigue resulting from this continuous strain is proportionately greater, as the amplitude of the variations of that force, and in consequence the maximum value of γ , is greater. What is true of the fatigue of the passenger, applies with equal force, taking the mechanical signification of the word, to every stress of the chassis and the carriage work. A low maximum value of γ is therefore an essential element of comfortable riding and of durability in the car and each one of its parts.

In the accompanying illustration, Fig. 1, let it be assumed that the body of the mass M , attached at a point on the chassis by means of a vertical fastening, of which the tension in repose is represented by F . Then when the acceleration of the vehicle is equal to the tension F becomes $F \pm M$, in such a manner that the measure of γ is reduced to the measure of the variation of the tension F . The following is a description of the manner in which M. Boyer-Guillon, head of one of the departments of the laboratory of the Automobile Club of France, and myself, have applied this principle to the construction of an apparatus for the experimental study of automobile suspensions. The body of the mass M is a cylindrical weight which may be caused to oscillate about an axis AA , perpendicular to a second axis as shown. The apparatus is arranged in such a manner that the center of gravity of the weight M falls upon this second axis, as shown in the plan view, Fig. 2, and in the horizontal plane of the axis AA , as shown.

The weight M is drilled to form a cylindrical cavity in which may be mounted the indicating spring R . The other end of this spring carries the stem VV , which runs through the weight M , and is guided by the frame which carries the entire apparatus and by the transverse piece T . This stem runs through the weight M without coming in contact with it at any point, and its upper end is provided with a milled screw which tightens up against T . The weight M is pressed upward by the action of the spring and rests against the washer C , fixed to the transverse piece T . In using the instrument, turning the milled screw down draws the stem VV upward, and, as a result, compresses the spring, thus applying the weight M against its stop with more and more force. The screw P carries a drum on which is marked a scale, permitting of the accurate measurement of the compression of the spring R , as the screw is turned up or down, and in consequence affords a means of ascertaining the pressure of the weight M against C , which is the difference of the tension of the spring R , and the weight M . The pressure p may be likened to the tension of the fastening of the weight to the chassis, which, as already mentioned, has been given as F .

With the aid of an electric current, it is possible to observe with considerable precision by means of the interruption and reestablishment of the contact, the moment that M is separated from its stop. At that instant, the variation of the tension is precisely p , and as a consequence, the value of the acceleration of the chassis may be determined. The apparatus is employed in the following manner. It is attached to a point on a car placed upon the drums of a testing machine, or run over a surface upon which have been arranged obstacles of a predetermined height and profile. The screw P is regulated to a nicety to the point where the weight M separates from its stop upon passing over these obstacles. The tension of the spring is then taken. By this means, it is possible to determine the maximum value of the acceleration of the chassis on passing over a known obstacle, and the characteristic value of the method of suspension of the car.

AUTOMATIC CARBURETERS AND FUEL TESTS.

When fashion decides that the carbureter of every automobile, regardless of type, shall be equipped with a carbureter without hand adjusting gear on it and that shall provide a constant and uniform, homogeneous mixture, whatever may be the speed of the motor, as it is put in the catalogues, the innovation will certainly be favorably received, because it will mark the end of an annoying subjection to this part, says Pol Ravigneaux in *La Technique Automobile*. So-called automatic carbureters flourish, but they are a debauch of diaphragms, slides and valves, designed to make up for the deficiency in skill of the hands of their users. In fact, the greater parts of the present carbureters, simple or complicated, crude or otherwise, give sufficiently good results, but somewhat to the detriment of economy. It is necessary that they automatically take care of the speed of the motor and in this they acquit themselves well, but this is not sufficient. They should do this with the best possible results in economy, and things are far from this stage at present.

Now that economy tests are the order of the day the almost unanimous return to the non-automatic carbureter may be remarked, or at least the addition of a supplementary air slide. The latter is susceptible in the hands of a good driver of giving excellent results. It may be asked if this addition is not a step toward an evolution contrary to the present trend of progress, for it cannot be denied that the automatic carbureter, on the score of simplicity, is not a great step forward. As the result of such economy tests as that afforded by international races of which the Grand Prix of the A. C. F. is an instance, there should be great progress made.

MOTOR TROUBLES AND HOW TO OVERCOME THEM

By ARTHUR H. DENISON.

THERE is no doubt that the modern gas engine is capable of making a great deal of trouble for its operators. It is also a well-known fact that trouble of the simplest form is usually the hardest to locate, unless certain precautions are taken. A general rule, covering the majority of forms of trouble found in the everyday use of the car, may be expressed thus: "The simpler matters seem, the worse they are," and vice versa.

A motor will never give trouble while running without also giving very plain indications of what is ailing it. As an illustration: If a person steps to a lighted gas jet and slowly shuts off the supply of gas, he may observe the effect on the flame, noticing it slowly shrink in size as the pressure of gas is reduced and when the supply is shut off the flame will die away. It follows, therefore, that if the same person was sitting in a room lighted by a single gas jet, and the light began to grow dim, he would look at the source of light. If the flame had shrunk, similar to that in his experiment, he would come to the conclusion, without need for further reasoning, that the supply of gas had failed.

Thus it is with our motor, with the difference that the phenomena present must be interpreted by the ear instead of the eye. The modern owner, looking after and making a close study of his car, will do well to consider just how the car or motor acted previous to "giving up," and not jumping instantly to the conclusion that the carbureter is in need of adjustment, or that the man that built the motor didn't know his business. Motor troubles are simply the motor's methods of protesting against working under unfavorable conditions. When trouble of any kind has been located and repaired, either on the road or by the garage repairman, the operator or owner should have the trouble traced backward to the cause and forward to the effect, satisfying himself of the relations between cause and effect, or how the cause could produce such an effect. In the majority of cases, many things not directly connected with the cause must be considered.

To illustrate this, let us consider a motor that is back-firing through the carbureter. This trouble, when not understood, is usually very alarming to those witnessing it. This would seem to indicate at once carbureter trouble, but a knowledge of the car is again essential. Our first step is to determine what condition of the cylinder and its inside arrangements will allow sufficient gas at a temperature high enough to ignite the incoming gas on the suction stroke, remaining after the exhaust stroke has been completed and the exhaust valve closed. There is only one reason which can cause this to take place, and that is the slow burning of the gas during the previous power stroke, consequently combustion is not nearly complete when the exhaust valve opens. The result seems to be that the exhaust stroke does not completely clear the cylinder, partly due to back pressure from gas expanding in the exhaust manifold. The vapor remaining is in the course of combustion, and when the inlet valve opens, allowing fresh gas to enter, the temperature is still sufficiently high to ignite the fresh gas, the wave of flame passing through the open valve manifold and finally blowing out through the air inlet. There is no danger of the gasoline in the standpipes catching fire, as the flame passes them at a speed possibly much higher than 1-100 of a second per foot. If fire did happen, the suction stroke following close would extinguish the slight flame.

Locate the Cause and Then Seek the Reason.

With conditions found, we must next find reasons. The spark plugs will be very sooty. If the car is equipped with

jump spark battery ignition, the possibilities are that the vibrators are badly in need of attention or the batteries exhausted. If the car be fitted with low tension magneto ignition, the location of the trouble is almost sure to be in the carbureter, and an examination of that organ should reveal trouble with the auxiliary air inlet, or some dirt in the spray nozzles, preventing a free flow of gasoline. A dirty carbureter, or opening the throttle quickly on any motor, is liable to cause backfiring. The remedy in either cause is obvious—adjust the tremblers, recharge or renew the batteries, or clean the carbureter. If the carbureter is of the adjustable needle valve type, the manufacturer should, after testing and setting it, provide a method of quickly determining whether the adjustment is near the correct point—as determined in the original tests. If the manufacturers have neglected this, the owner or operator should mark it himself.

In one of our experiments the action of the motor gave us a good indication of where our trouble was. Some one

Diagram Showing Experiment to Locate Ignition Trouble.

may ask: "Well, supposing a motor, running smoothly, suddenly stops firing; have you any indication of its trouble in that case?" The answer is simple. If we break the electrical connection by turning the switch, how does the motor act? Therefore, hunt for a broken wire or permanent short-circuit of the primary wiring connections. Cause and effect are traced very easily there. On the other hand, troubles may come and disappear of their own accord, and others may come and we overcome them without having any more knowledge at the end than at the beginning. It is only by intelligently attacking each difficulty and making ourselves as familiar as possible with the conditions under which our motors work, and refuse to work, that we can expect reasonable satisfaction from this performance. In the following accounts the troubles belong to the list that cannot be traced, and the motor's performance did not aid us any.

Typical Instances of Mysterious but Simple Causes.

While road testing the Excelsior cars last year, I brought a car back to the factory one day, the motor running very well. I stopped the motor, letting it stand for about half an hour, and when I tried to start it up again it would not give a sign of an explosion. It was equipped with low-tension ignition and magneto. Thinking that there might be a short-circuited plug, I tried cutting out each cylinder successively, then two at a time, but this did not help me. The

timing of the magneto was next examined and found correct, and in order to eliminate trouble in the wiring or switch, I ran a wire directly from the magneto to the bus-bar (see sketch.) This didn't aid matters. Then I sent for a testing magneto to ring out both connections and magneto. One test seemed to indicate a short-circuit in the magneto and the next nothing wrong. Next, I got a set of dry cells and coil, connected them on to the other side of the switch and the motor started readily, when cranked, but refused to run on the magneto. Finally, one of the other testers, who had been assisting, had taken out the carbon brush that was pressing against a collecting ring which has attached to it the ground end of the armature winding completing the ignition circuit. The carbon was found very dirty and foul. It was cleaned out, and a little gasoline squirted in to clean the brush holder, replaced, the motor cranked and it started readily. The cause of the trouble here is rather obscure, but it is probable that a little speck of dirt held the brush off contact. Other influences, such as the fact that the current from the magneto will overcome a certain amount of resistance, etc., were valueless; that motor wouldn't start.

Later, one of the other testers was bothered with trouble rather similar to the above that defied, for nearly an hour, all his efforts to locate it. The car, of the same make, was fully equipped and party were touring when the engine died in a narrow road in such a place that both the road and a suburban trolley line were tied up. He made all the tests possible to make on the road, as described above, including a close examination of the switch and connections, without any result, and, as a last resource, connected the magneto directly to the bus-bar (see sketch). On cranking the motor it started readily and a new switch overcame the trouble. The old one, when tested later, seemed to be in good condition. I was not informed whether the motor was rewired or not, but the hood support passed directly over the connections through the dash, and there must have been a leak there. Otherwise broken insulation must have provided a path for the escape of the current at some other point.

Another peculiar trouble that I cannot explain occurred to me while about half way on a long trip—about a hundred miles from start and from finish. Cylinder No. 1—front—start-

ed to miss irregularly while traveling up a very slight grade. It rapidly became worse, and I tried rocking the spark lever sharply up and down its quadrant. Retarding the spark finally seemed to help it a little—for a distance measured most conveniently in feet. With make-and-break ignition, the armature of the magneto was set 1-32 inch past center with igniters fully advanced. The motor seeming to improve by retarding the spark appeared to indicate a leaky plug, so I stopped and changed it, putting in a new one and resetting the hammer at the same time. The motor ran good for about one hundred yards when the performance began again, exactly similar to the first symptoms of trouble. I stopped again, took out the plug, and examined it, replaced it, and examined carefully the exterior mechanism of the igniter to see if there was any possibility of its sticking or binding anywhere.

Sit Down and Reason Things Out Leisurly.

Everything seemed right, and on starting the motor it ran good for a hundred yards or so again, then started to miss. I stopped and then took out the complete igniter—both hammer and plug or anvil. Both still looked very good, the hammer working freely in its bushing and the head showing so little the pitting action of the spark that I didn't consider it possible to have trouble there. While considering matters, I picked up a file and dressed the head a little, and having done all I could think of, put things back carefully and started the motor. The next time I had occasion to touch the igniter was after 1,500 miles had been traveled. What action or combination of factors cured that trouble I cannot say, for the reason that I have seen hammers and plugs both pitted 1-8 inch deep, firing well.

These three accounts may help bear out my statement that the simpler matters seem, the worse they are. As in the first instance, a dead motor is liable to make things more difficult than if the motor was running until stopped by or gave other indications of trouble. Should you who read them be stopped on the road this Spring with trouble that eludes you, sit down on anything convenient and spend five minutes in thoughtful consideration. It may save you an hour's work, and it will certainly save your temper and patience more than aimless fussing.

AS H. H. FRANKLIN SIZES UP OUTLOOK.

By H. H. FRANKLIN.

"A luxury and the first to suffer," was said of the automobile when the panic came. It made the thoughtful maker of automobiles "sit up and take notice," and those who were able to appreciate the significance of business conditions then are the ones who are now reaping, and will reap, the benefit of their foresight.

The panic through which we have been passing has tended to reduce extravagance and useless expenditure. Owners of automobiles have studied the situation; new buyers are investigating, and some, indeed, refuse to buy at all. The wealthy man who was going to put a large price into a large machine is looking for something costing less, and likewise the man with less money is more cautious, but sales are being made, and more sales will be made.

The question is, "What will be in demand?" When the financial stringency began, it appeared to me that automobiles of medium price and medium size would suffer the least, and that as the Franklins were in that class and also light in weight, and very economical, our company would continue to do a large business. What happened? Our sales in November were \$38,142 more than in November, 1906. Sales for December were \$46,373 more than in December, 1906. While January sales showed no increase, they equaled December sales, and in February the shipping orders are coming in at an average daily rate of 35 per cent. over the daily rate of January.

ERRORS IN REASSEMBLING NOT UNCOMMON.

It is not an altogether unknown thing for the best paid mechanics and foremen to get things together wrong when reassembling a car, so it naturally follows that the amateur may readily commit similar sins. In one case the omission of a small part of the carbureter permitted the latter to function after a manner and many blind trails were followed before the true cause of the trouble was discovered. This applies particularly to the auxiliary air inlet valve. The latter is rather a ticklish piece of mechanism and one to which the maxim about letting well enough alone applies with all its force, so that it may readily be imagined that failure to assemble correctly would not be apt to improve matters to any great extent.

Sometimes the manufacturer is guilty of an error in the original assembling, but with the painstaking methods of testing cars that have come into vogue, the occasions on which such mistakes can escape the fine-tooth comb process of inspection and trial to which every part of the car is put must be rare indeed. It is the repairman who is most often at fault, and as the majority of cars, though seemingly very much alike, differ more or less in detail, the assembler is often prone to put things back on the car according to preconceived notions of his own as to the way they should go rather than according to the manner originally intended for them by the designer of the car. Of course, this does not apply to the carbureter alone, but to practically every part of the car with which the repairman has to do.

LETTERS INTERESTING AND INSTRUCTIVE

PUTTING IN A NEW PROPELLER SHAFT.

Editor THE AUTOMOBILE:

[1,232.]—Will you please tell me how I can do away with the rear universal joint on a shaft-driven steam car—no change speed or clutch? The shaft between the rear universal and rear axle is about 9 inches long, running in a brass bearing. This bearing soon wears, allowing the shaft to jump, especially when running slow or turning. If possible, I would like to put in a solid shaft with the one universal and slip joint at the engine. C. H. HOYT.

Jefferson, Ore.

Without further details than you supply in your letter it is rather difficult to advise you definitely on this point. We should think, however, that unless the arrangement at the rear axle you speak of is altered you will have this trouble regardless of the situation of the single universal. As at present arranged this bearing receives all the angular thrust of the universal, which accounts for its rapid wear. Why not place the rear universal as close as possible to the bevel driving pinion, thus doing away with the 9-inch shaft you speak of? That is, instead of the 9-inch shaft and its brass bearing, substitute an annular ball-bearing of the thrust type and place the universal directly forward of this. Or, as suggested, the universal and slip-joint might be placed directly back of the engine. If the shaft between the engine and the rear axle is very long, we should not advise the use of a single universal at the forward end, but would prefer two.

ABOUT RENEWING OLD DRY CELLS.

Editor THE AUTOMOBILE:

[1,233.]—In the January 23 issue of "The Automobile" L. M. Lowe, M.D., writes regarding the renewing of "Dry Batteries." We have a preparation which we use to renew old dry batteries, and it works O. K. We have made the following test: We have an electric engine which requires three new dry batteries to turn it over and four to run it at a moderate speed. We took six batteries, which before being treated with our solution were perfectly dead, and they ran the engine at about the same speed as the four new ones. The cost of renewing old cells by our method is very low—one cent or less per cell. SELFE & WHITEFORD.

Darlington, Md.

It is a matter of common knowledge that certain alkaline solutions such as salt and water, sal ammoniac and water, or vinegar and water, can be used to rejuvenate an apparently exhausted dry cell, but that the extra period of life thus obtainable is very short. We do not wish to cast any doubt on the correctness of your tests, but are willing to be shown, first, that the cells on which the solution was tried were absolutely exhausted beyond any possibility of recuperation by standing on open circuit, and, second, that when thus treated they produced an amount of current, or were good for an additional period of activity sufficient to make it worth while to thus treat them.

GEARING ATTACHMENTS FOR FARM IMPLEMENTS.

Editor THE AUTOMOBILE:

[1,234.]—Have you any attachments for gearing a wagon with a gasoline engine, so I can run a wagon, a plow, or a harrow, or do general farming with? Or where can I get them?

Frederick, Okla.

JAMES CLAIR.

We do not make or sell automobiles or parts and cannot inform you offhand just where you can obtain the equipment you have need of. However, there are numerous manufacturers who make a specialty of such things and we have no doubt that immediately your letter comes to their attention through its publication in THE AUTOMOBILE they will correspond with you direct. Many farmers buy a clutch such as is ordinarily used on stationary gas engines, a pair of common sprockets and chains and rig their wagons up themselves, as this is not a very difficult matter for anyone at all handy with tools.

EFFECT OF LENGTHENING THE STROKE.

Editor THE AUTOMOBILE:

[1,235.]—In reply to Mr. Frost's inquiry, No. 1,206, you say that "both the power and the efficiency of an internal combustion motor are increased by lengthening the stroke." While this statement is all right as to power, for the simple reason that power is the product of time, distance and resistance overcome, I do not think it is correct as to efficiency, at least in the ordinary type of explosion motor.

Efficiency depends upon the number of expansions attained by the charge, that is, the ratio of combustion volume (clearance) to stroke volume, and as the minimum relative volume of the combustion space is determined by the point at which preignition occurs from compression heat, or, in other words, is in a substantially constant ratio to the stroke volume, it follows that if the stroke be lengthened, the combustion space must be lengthened in the same ratio. Therefore there will be no gain in efficiency in a long-stroke engine unless it be in a slight degree, owing to the changed ratio of cooling surface in the combustion chamber, although this is problematical, because of certain factors having to do with the relative cooling power of cylinder-walls and piston-head.

I think it will be found that the principal reason why stationary engines have longer strokes is that their builders desire to get power at low speed (i.e. number of revolutions per minute), are not limited as to length and weight of engine, and have sought maximum durability. If one should attempt to increase the stroke of an engine having a given bore, and retain the same speed as before in the effort to increase the power, he would probably encounter some difficulties in the matter of increased inertia and centrifugal effects, besides the augmenting of length and weight.

That the efficiency of an explosion engine can nevertheless be considerably increased and a cooler engine secured by the simple expedient of charge-rejection during the early part of the compression stroke, is a fact which it is surprising to find is not more generally taken advantage of by four-cycle engine builders, although it has long been known, being embodied, for example, in the French Charon stationary engine.

To take care of the rejected portion of the charge in a single-cylinder engine involves some complication, but with multiple cylinders, and especially four and six cylinder combinations, the rejected portion simply goes back through the inlet manifold to the next cylinder, which is drawing in a charge, there being, therefore, no back-flow out of the carbureter, and the only change involved over present designs is a longer arc on the admission cams and a smaller combustion space. Such an engine would gain economy by expanding to a greater volume than that from which it begins to compress, its combustion space would have less radiating surface and involve better exhaust displacement, the engine would run cooler because of greater cooling by useful expansion, and the exhaust pressure would be reduced, with consequent less necessity for muffling and back-pressure. The inlet manifold is also kept warmer and complete vaporization of fuel promoted.

The specific power per unit weight of such an engine would probably be as great as or greater than present ones, and its maximum compression could be somewhat increased because beginning nearer the dead-center point. I feel confident that if engines were constructed on this principle, air-cooling would experience a considerable rise in popularity. Makers could then advertise their engines with perfect candor as being "internally cooled."

New York City.

R. M. PIERSON.

We do not agree with you in the statement that lengthening the stroke does not increase the efficiency, and think you go wrong on the assumption that lengthening the stroke necessarily means shortening or lengthening the combustion chamber proportionately. If we have a motor with a 6-inch stroke and a 2-inch combustion chamber, a similar motor can be designed with a 7 or 7 1/2-inch stroke and a 2-inch combustion chamber, and in operation it will expand the same volume from the same initial and explosive pressure, down to a much lower terminal pressure than would be the case where the stroke is only six inches. Short-stroke automobile motors exhaust at terminal pressures as high as 40 to 50 pounds per square inch, while stationary motors of good design get as low as 10 to 15 pounds per square inch terminal pressure. The utilization of the difference in pressure mentioned makes for greater efficiency and is brought about directly by the increase in the stroke.

Long stroke motors are necessarily of the slow-speed type, but this and amply proportioned parts make for durability, as a stationary engine is usually designed to work ten or twelve hours a day and about 300 days in the year with a minimum of attention. The gain in power and efficiency is naturally offset to a slight degree by the increased radiating surface presented to the hot gases. Altering the dimensions of the motor as outlined above would increase the ratio of stroke volume, or piston displacement, to combustion volume, and would necessarily permit of a greater expansion of the same volume of charge, on which our contention of increased efficiency is based. The question of pre-ignition need not be a serious deterrent factor in lengthening the stroke, as it is possible to keep the compression within safe limits by regulating the volume of fuel admitted.

We find your description of the Charon stationary motor interesting, and doubtless further work along this line may prove one of the developments of the future.

EFFICIENCIES OF STEAM AND GASOLINE.

Editor THE AUTOMOBILE:

[1,236.]—I should be glad if you could inform me, through your columns, what is the average consumption of gasoline per mile in White steamers. Does it vary in the amount consumed according to the rate of speed? What is the loss in power of the gasoline car between the cylinder and rear wheels? What is the loss in the steam car from cylinder to rear wheels, and how do you account for said loss?

F. BARROW.

Chicago, Ill.

This is as low as six miles to the gallon and as high as thirteen; probably the average is about nine to eleven miles to the gallon of fuel. It naturally varies in accordance with the speed, as considerably more fuel will be consumed running at a low speed than at a much higher rate of travel. Every car has what may be termed its critical speed—i. e. the rate at which it is most efficient. In gasoline cars this has been found to be between twenty and thirty miles an hour, some being the most economical at twenty-five miles an hour, the increased amount of fuel at fifteen miles being almost 50 per cent., while the same thing is true when speeds of forty to fifty miles an hour are reached. At the lower speeds the excess is fuel wasted, while at the higher speeds it represents the extra amount required to propel the car at that rate.

Transmission losses vary in different cars, running as low as 15 per cent. and as high as 40 per cent., or even greater, and depending upon the age as well as the particular make of car, as gearing becomes much less efficient when worn. This, of course, has reference to the losses when on the direct drive, the clutch, universals and bevel drive being the chief points of loss. In the steamer there is the bevel drive and universals, so that the latter should naturally show a slightly superior transmission efficiency. In both cases the slippage at the road wheels and similar factors have been omitted from consideration as being the same in either case.

INFORMATION WANTED ABOUT "ENERGINE."

Editor THE AUTOMOBILE:

[1,237.]—Will you please inform me if "Engerine," made by the Engerine Refining Company, is superior to gasoline and not harmful to an engine?

Where can I get a complete descriptive directory of all makes of automobiles in the United States?

C. F. WHEELER.

Vilas, Colo.

We have never heard exactly what substances were employed in the compounding of "Engerine," nor, on the other hand, have we had any occasion to doubt the maker's claims to superiority. This also applies to your query as to whether it is harmful to the engine or not, no instance of complaint on this score ever having been brought to our attention. We do not believe that there is any such directory published. However, we have compiled complete lists in THE AUTOMOBILE once a year, the last one

appearing in the issue just prior to the A. M. C. M. A. Show, held in the Grand Central Palace, New York, in October, 1907.

A CASE OF CHAINS RATHER THAN SPROCKETS.

Editor THE AUTOMOBILE:

[1,238.]—I am having trouble with the front sprocket on my Rambler Model 21 automobile, and would like a little information about it. The sprockets furnished by the factory wear out every 1,500 miles. The factory insist that they are all right, both in material and design. They are made of soft steel, case hardened. I would like to know if a sprocket made from tool steel would be more durable, and if not, what other material would give better service? Is the mileage I get all that can be expected? Would it be advisable to put on a chain boot, and, if so, why do not manufacturers put them on in the first place? It is not only a lot of work, but quite an expense to make replacements so often, and it is not at all satisfactory to me.

PAUL F. FRANK.

Crestline, O.

Tool steel would not give anything like the service that can reasonably be expected from a case-hardened sprocket. It strikes us that the fault does not lie in the sprockets at all, but in the chains. The latter have become worn and are no longer of the proper pitch to suit the sprockets, which in consequence suffer from the chain's riding on the teeth to a greater or less extent, until the latter have worn away to a point where the distance between them is equivalent to that of the worn chain links, and then the sprockets are no longer fit for service. We think if you will replace the sprockets and the chain at the same time and will keep the chain properly adjusted you will have no further trouble on this score and that your mileage with a pair of sprockets will be greatly increased. A boot would save the chain if it could be kept oil-tight.

SOME QUERIES CONCERNING TIRES.

Editor THE AUTOMOBILE:

[1,239.]—Kindly help us out with the following problem. While we have never read anything of the same order in "Letters Interesting and Instructive," we feel it would be interesting to all subscribers. Last summer we used a pair of the well-known leather treads on our rear tires and found it took about 1-8 of the power, beside the trouble of keeping them absolutely tight. We wish to know if you would advise us to put them on a new car which we have just purchased, before the treads get worn. As the car is quite heavy on the rear tires anyway, we are at loss to know where we are at. What would you do in this case? Also advise us if we can use Goodrich tires on Goodyear Universal detachable rims. We are ordering an extra tire, and prefer the Goodrich. If we can use them.

G. W. CURTISS.

Ravenna, O.

It depends upon what kind of roads you have to run over constantly whether it is worth while to consume as much as one-eighth of the power by using the leather, steel-studded treads. But a smooth tread pneumatic tire should always be kept inflated to a point where it is perfectly tight, so that one gives no more trouble on this score than the other. Goodrich or any other standard American tires can be used on the Goodyear rims, as the name "Universal" indicates. If the going is poor and apt to be slippery, doubtless the leather treads will be found well worth the extra amount of power they consume.

A FEATURE OF THE RENAULT AEROPLANE MOTOR.

Editor THE AUTOMOBILE:

[1,240.]—In your last issue, March 5, I read an article on the Renault engine, to be used by Farman. In describing the pistons, it stated that they are fitted with a circular groove in their base, pierced with holes to prevent oil passing from crankcase into the combustion chamber. Would you kindly describe this method of fitting a groove in the pistons, as I am inclined to believe it would be a good thing on a large number of engines, if it would prevent oil passing from the crankcase to the combustion chamber.

Scranton, Pa.

E. J. HOWELLS.

This groove is turned in the piston near its lower end, and, with the exception of the holes, which are drilled clear through the wall of the piston, opening into the bottom of

the groove, it is the usual device employed for facilitating the oiling of the cylinder. This groove serves to catch the splash of oil in the crankcase and carries it up along the cylinder walls, and where an excessive amount is thus carried up it finds its way into the combustion chamber. In the Renault motor in question any excess is squeezed out through the holes.

SOME QUERIES CONCERNING GASOLINE.

Editor THE AUTOMOBILE:

[1,241.]—In looking over your columns, I noticed quite a number of questions from the subscribers, and thought possibly you might help me out. I have had some trouble with gasoline. Although the gasoline I get registers seventy-six, it does not seem to bring results. What I want to know is whether gasoline can be adulterated, profitably, in such a manner as to have it appear, when tested with a gauge, to be seventy-six. The gasoline I am getting has a clouded appearance instead of being clear. I strain all my gasoline through chamols, so it cannot be water that causes my trouble. I have had a good deal of experience with low-grade gasoline, and my car acts just like it was running on poor fuel. The car is practically new, and the carbureter is in perfect condition.

St. Louis, Mo.

B. G. V. C.

We never heard of a case where the gasoline had a cloudy appearance and are at a loss to say what such a condition can be attributed to. It may not be gasoline at all that you are getting, and we may add for your information that there is little, if any, gasoline of the lighter grades of gasoline now on the market, such as 76 degrees s.g. In fact, the Standard Oil Company announced some two years ago that it was compelled to abandon marketing the lighter grades owing to the very heavy demand. Procure some good fuel and see how the motor acts with it. Probably some of our subscribers have had similar experience and can help us out.

QUERIES CONCERNING SINGLE-CYLINDER MOTOR.

Editor THE AUTOMOBILE:

[1,242.]—Being a subscriber to "The Automobile," I take the liberty of asking a few questions.

1. On a three-horsepower single-cylinder, four-cycle engine, would a mixing valve give a good mixture and good power at all speeds, and would the engine (with a 24-pound flywheel) be fairly flexible? Would I have to use a carbureter?

2. On the same engine—which is a jump spark—would an anti-vibrating coil be satisfactory, or would a vibrating coil be needed?

3. I have a small 6-volt dynamo with which I wish to spark this engine (after it gets going at a fair speed on batteries). Would I not need an automatic friction governor pulley on the dynamo to prevent it from burning itself or the coil out at high speed?

New York.

H. L. G.

1.—A mixing valve would give good service, but a carbureter would be better. The flywheel is very light, unless it happens to be of large diameter. Unless it measures more than twenty inches in diameter it would require about twice this weight to permit of the motor being throttled down to any extent.

2.—A non-vibrating coil gives excellent service provided the timing device is dependable.

3.—A governor is an absolute necessity on any dynamo where the speed is apt to fluctuate between such wide limits as is the case on a small high-speed engine. It will undoubtedly ruin both itself and the coil otherwise.

LIGHTING SIDE AND TAIL LAMPS ELECTRICALLY.

Editor THE AUTOMOBILE:

[1,243.]—Will you kindly advise me, through your "Letters Interesting and Instructive," how one having an Apple dynamo and storage battery can light the tail and side lamps with the current? I find "The Automobile" very instructive as well as interesting.

Greene, Iowa.

J. COMPTON.

The lamps can be wired directly from the battery on a circuit independent from the ignition circuit, and, provided the battery has sufficient capacity to carry both without impairing the ignition, the service will be perfectly satisfactory. In fact, the makers of the apparatus in question advertise that this is one of its advantages and will supply full information regarding the manner in which the wiring is done.

FOR BRAZING A CRACKED CYLINDER JACKET.

Editor THE AUTOMOBILE:

[1,244.]—I own a Reo runabout, Model B. Last fall, just before putting it away for the winter, I let the water freeze in it, which resulted in the bursting of the water jacket. I have had the opinion of several and find the best job can be done by brazing it. Could you refer me to some good, reliable firm that could do this? The jacket is cast iron and is a very nice thing to braze.

Lebanon, N. J.

E. B. SHURTS.

Look through out advertising columns and you will probably find the announcement of some firm that makes a specialty of doing such work. However, if the crack is not very large it may be possible to repair it without brazing or even removing the engine from the chassis. Clean out the entire fissure as much as possible, and with the end of a chisel or a file try to make the interior slightly larger than the surface opening. Make a paste of fine iron filings, sal ammoniac and water in the proportion of about 90 per cent. filings and 10 per cent. sal ammoniac. Fill the crack with this completely and pack it very tightly, putting considerably more on the outside than is really needed. Allow it to rust for a few days and it will doubtless be found to hold water. Ordinarily there is very little pressure on water-jacket walls, so that this repair should give no trouble.

WANTED: SPECIAL VALVE-GRINDING COMPOUND.

Editor THE AUTOMOBILE:

[1,245.]—Will you please let me know whether there is on the market a substance for grinding valves other than emery or ground glass, and which, if accidentally introduced into the cylinder, will not score it?

In overhauling my engine, I find that the valves are in good shape and not at all pitted, but I should like to grind them in to insure tightness, and would like to use some such substance as indicated above.

Batavia, N. Y.

A. G. HOUGH.

There are numerous special compounds on the market for valve-grinding and you will find some of them advertised in our columns. Whether any of them have the quality of not scoring the cylinder walls when they come in contact with them, but of proving good abrasives when applied to the valves, is a hard question to answer, as mere location does not change the nature of a substance. However, some of them are put up in such form as to facilitate preventing any of the compound getting into the combustion chamber.

TWO ASKING THE SAME INFORMATION.

Editor THE AUTOMOBILE:

[1,246.]—What kind of black top or leather dressing will be necessary, or what method will I have to pursue to make a red Pantasote top black?

READER.

Necedah, Wis.

Editor THE AUTOMOBILE:

[1,247.]—Kindly let us know through "Letters Interesting and Instructive" what is a good cleaner for Pantasote tops.

Charlotte, N. C.

OSMOND L. BARRINGER COMPANY.

A. W. McRae.

We will have to refer you to the manufacturers of Pantasote, as we do not know, nor have we ever heard that a material especially intended for this purpose was on the market.

WATER DRIPPING FROM THE MUFFLER.

Editor THE AUTOMOBILE:

[1,248.]—I am using a two-cylinder car and notice when the motor is started that a few drops of water comes from the muffler. Can you tell me the cause?

Metamora, Ill.

J. C. SNYDER.

There is always more or less moisture in the air employed to make the explosive mixture. It vaporizes in the form of steam while the motor is running and escapes from the muffler, but when the engine comes to a stop there is some of it left in the cylinder, the exhaust passages and the muffler, and when these are allowed to get cold it condenses in the form of water. This is what you see issuing from the muffler when the engine is restarted.

BEST ROUTE FOR TRANSCONTINENTAL TOURING.

Editor THE AUTOMOBILE:

[1,249.]—Where can I secure a map of the best routes for transcontinental trips?

A. R. M'LANE.

Prosser, Wash.

We would refer you to the May 16, 1907, issue of THE AUTOMOBILE, page 827, on which you will find an article entitled, "A Cruise Across the Continent," which is probably the most complete recent information to be had on the subject. We have also sent you particulars and map by mail. The only complete work extant on the roads of this country is the Official Automobile Blue Book of the American Automobile Association, but this as yet does not include any information on Transcontinental routes.

WHO CAN IDENTIFY THIS MOTOR?

Editor THE AUTOMOBILE:

[1,250.]—Kindly tell me through "Letters Interesting and Instructive" the name and manufacturer of an 18-20-horsepower two-cycle opposed water-cooled engine with valves in the head, mechanically operated, large square crank case, length over all about 49 inches by 14 inches, and large flywheel, 3 inches by 19 inches.

Sedalla, Mo.

F. W. FISHER.

From the specifications you give we find it next to impossible to identify the motor you have in mind, as it is not customary to use a foot rule in examining a motor except where wanted to fill a certain space. Probably some of our subscribers will come to the rescue.

GEAR RATIOS OF A 45-HORSEPOWER CAR.

Editor THE AUTOMOBILE:

[1,251.]—What are generally considered as standard ratios of gear reduction for a 45-horsepower, water-cooled, shaft-driven touring car with sliding gear giving three forward speeds and one reverse?

L. U. L.

Little Falls, N. Y.

Taking the Pierce Great Arrow, 1907 model, as a representative example of the American 45-horsepower car, the ratios are as follows: On the direct drive, 2.88 to 1; on the intermediate, 3.06 to 1; on the low, 3.26 to 1, while the reverse is slightly lower than the low forward speed.

DENATURED ALCOHOL ON A SMALL SCALE.

Editor THE AUTOMOBILE:

[1,252.]—I would like to have you send me a copy of the new denatured alcohol law, with information from which I can make a twenty-gallon still for its manufacture.

G. H. FEATS.

Flint, Mich.

You can probably obtain this information by writing to the Department of the Interior, Washington, D. C.

KEEPING THE CYLINDERS AND PLUGS CLEAN.

Editor THE AUTOMOBILE:

[1,253.]—When I wrote you my experience with radium decarbonizer in my Ford Model N, I had no idea that there was such a need for just such an article. I know better now, and that is why I am writing this, for my brothers in trouble. I also know about the enormous circulation of your paper, "The Automobile," as nearly every mail since the publication of my article brings me pleadings for help on the lubrication question, asking what the decarbonizer is, and where it can be obtained. I am also made aware of the fact that there are readers of your most excellent journal who slight the advertising pages or they would find prominently displayed the advertisement of the radium decarbonizer people, even in the same issue as the one in which my few lines appeared.

In your last issue a correspondent asks a pertinent question as to kerosene oil and its effect on cutting other oils. I am glad he asked, as he did, for I did not make myself clear in letter No. 1,181. What I meant to say was "kerosene could be used at same time and would not soot up plugs or piston rings."

Now, for the benefit of all, I will give my experience for the past four months without looking at a plug. It is this: Twice a week I pour from a pint to a quart of cylinder oil, using Standard gas engine oil, which costs me 35 cents per gallon, into the breathing tube, or the upright pipe leading to the crankcase. After doing this I pour from 4 to 6 ounces of the decarbonizer into the same tube, screw down the cap and start the engine. A heavy, dark smoke will issue from the muffler, but will become lighter as engine gets hot; the plugs remain bright and clean. I also keep reservoir full of oil, with same proportion of decarbonizer, feeding about 20

drops to the crankcase and about 5 drops to the half bearing on main shaft per minute. I presume a higher grade of cylinder oil would require less of the decarbonizer.

The decarbonizer is put on the market to clean the cylinders, plugs, rings, mufflers, pipes, etc., when sooted and fouled up. When used in the manner indicated, it prevents the formation of carbon, and, so far as I know, I am the first person to use it as herein outlined. I have a very lasting and abiding impression of the trouble I used to have cleaning plugs and trying to regulate the oil supply, and now I have no trouble, so it seems to me the relation of my experience will not come amiss.

Milwaukee, Wis.

J. L. WILLIAMSON, M.D.

CUTS OUT IGNITION TO SAVE MUFFLER.

Editor THE AUTOMOBILE:

[1,254.]—I have been very much interested in the discussion of the proper method of using the motor as a brake, and especially so in that of No. 1,204, which takes up the question of whether or not it is best to cut out the ignition while coasting down a grade. The theory is advanced that cutting out the ignition saves the battery and thus saves expense. While this is undoubtedly true as far as it goes, it seems to me that there is another phase of the question which demands serious consideration, and that is the question of the collection of unburned gas in the muffler.

In driving several different makes of cars it has been my experience that, after coasting down even a moderately long grade, with the switch off, there is apt to be in the muffler a collection of unburned gas, which will be fired by the first explosion in the cylinder after the switch is turned on at the bottom of the hill. This has occurred in cases where closing the throttle while the car was standing would stop the motor, as mentioned in the article referred to, which fact shows that the quantity of gas drawn into the cylinder during any one charging stroke was very small. These gas collections and the subsequent explosions are very apt to result in a destroyed muffler, and in four distinct cases have, to my knowledge, resulted in this way.

Now, if the spark is left on while coasting down a hill, this gas will be burned as it comes into the cylinder, and, on account of its small amount, it will burn with almost no explosion and therefore will not materially detract from the braking power of the motor.

It has been my experience, and not with one make of cars only, that even though the throttle on some makes of cars is supposed to cut off absolutely the supply of gas, in most cases a small amount will leak past on each suction stroke, and these successive small amounts, when allowed to collect for the short time taken to run down a comparatively short grade, will form a collection large enough to produce the results described above.

It seems to me, then, that unless a man is some distance from home with batteries which he knows to be weak, the insurance against muffler explosions and consequent damaged mufflers more than overbalances the small saving in battery consumption.

I hope to see more discussion of practical problems of actual road running.

J. ARTHUR FISH.

Ithaca, N. Y.

SOME HINTS ON GRAPHITE LUBRICATION.

Editor THE AUTOMOBILE:

[1,255.]—In issue of March 5, you ask for "views of others on lubrication." It seems to me as though there should be no special fear of cutting or "seizing" of cylinders if a man will only get the "graphite habit." In my first machine, the Autocar, I began the habit of introducing graphite into the crankcase. In my next car, the Elmore, I kept up the habit, and followed the same habit with the Long Distance, the Reading Durvea and the Franklin—my last and best of all. In between I had two Stanley steamers, and graphite in the cylinders was a real necessity.

I introduced the graphite into the steam cylinders by means of a small hand-oil-pump attached to the steam pipe. This practice is all right with any steam automobile. As to how graphite may be introduced into the crankcase of a gasoline machine, no man with gumption need be told. In using graphite don't use over a teaspoonful to the pint of oil; you need no more. The graphite will not get up in the combustion chamber to do any harm. There need be no fear of its getting on to the spark plug. I have always used Dixon's 635, or motor graphite. This is a flake graphite, and the flakes build up all the microscopical irregularities on the bearing and wearing surfaces of pistons, rings, and cylinders, forming a graphite to graphite contact.

I have made use of the best amorphous graphite, but found that it formed into balls or pellets, and it doesn't withstand the great heat in the cylinder as well as flake graphite. When flake graphite is used in cylinders there will be better lubrication in cylinders, better compression, less oil needed, and greater satisfaction to the driver. There are many other places on the automobile where flake graphite will be found an important factor.

Jersey City, N. J.

NO. 126, NEW JERSEY.

FEATURES OF THE STEARNS CAR FOR 1908

CONSISTENT adherence to a design that is the evolution of several years' experience and that has had ample opportunity to demonstrate its merit, marks the Stearns cars for 1908, and this applies not alone to its power plant, but to the entire chassis, including every one of those distinctive features of design and construction that have become familiar as car-marks of the Stearns product. For this season the four-cylinder car is a 30-60-horsepower car with cylinders having 5 $\frac{3}{8}$ -inch bore and 5 $\frac{7}{8}$ -inch stroke. Coupling it with the rear wheels are an expanding clutch, four-speed selective gear-set and a side chain type of drive. The car has anti-friction bearings throughout, having no less than forty-four DWF bearings, distributed as follows: Wheels, eight; transmission, thirteen; motor, ten; fan, two; clutch, three; steering parts, four, and magneto, four. In the motor, three ball races carry the crankshaft and four carry the camshaft. The improvements as compared with the 1907 machine include carburetor refinements, new motor accessory arrangements, transmission improvement and some steering gear changes.

The Stearns four-cylinder motor resembles in general layout the 1907 one, in that its cylinders are cast in pairs with valves in an integral chamber on the left side and opened by direct lift from a camshaft within the crankcase. The cylinder castings are made without heads for the water jackets and take large oval plates instead. While this part of the design is as a year ago, great changes have been made in the arrangement of the water pump, oiler, timer and magneto. The water pump is carried within the left front motor arm, its position being a very unusual one, as indicated at *WP* in the right side engine illustration, as well as in the front view of the motor. Standing beside the engine, it cannot be seen, its location being indicated, however, by the pipe *WI*, which leads from the top of the motor support arm to the water jackets on the valve side. The crankcase is cast with a bedplate across its forward end, which forms a support for the radiator, thereby taking the radiator entirely

away from the chassis frame and making it a unit with the motor crankcase, thus relieving it of all torsional strains.

This construction brings the radiator and pump so close together that a hose connection between them is unnecessary, the only tubing essential being an elbow from the base of the radiator to an opening *W2*, whence the crankcase is drilled to the losing of the water pump. To remove the water pump, which is on a separate shaft, it is but necessary to remove a large diameter cap threaded into the rear face of the motor arm containing the pump. At the right side of the motor appears another example of what use can be made of the supporting arm. A multi-faceted Lavigne oiler *L* has its casing the aluminum supporting arm, just as the water pump has its casing the supporting arm on the opposite side. A separate shaft gear-driven through an idler from the crankshaft, drives the bank of pumps in the oiler and has on its rear end a jaw coupling *J* for connection with the magneto. On the shaft is a helical gear for driving the short vertical shaft of the timer *T*. This arrangement gives a most compact grouping of the oiler, timer and magneto, and leaves ample room for the steering gear, the lower portion of the column of which appears in the rear of the magneto. The magneto rests on a bed plate which fills the rectangle between the crankcase, the frame and the front and rear motor-supporting arm.

Stearns Improved Draglink Connection.

The Stearns crankcase is a one-piece casting instead of the conventional upper- and lower-half case, and because of this the crankshaft, camshaft and other motor shafts must be removed endwise through the front of the crankcase, and when removed the bearings and their bushings are removed with them. This is accomplished in the following manner: The rear bearing of the camshaft is held direct in the end of the crankcase; the second bearing has a bushing; the third bearing has a bushing of greater diameter than the bushing on the second bearing; and the fourth bearing has a bushing larger than either of the other bushings. In removing the camshaft these bushings

removed the bearings and their bushings are removed with them. This is accomplished in the following manner: The rear bearing of the camshaft is held direct in the end of the crankcase; the second bearing has a bushing; the third bearing has a bushing of greater diameter than the bushing on the second bearing; and the fourth bearing has a bushing larger than either of the other bushings. In removing the camshaft these bushings

Exhaust Side, Showing Oiler and Magneto Drive.

Operating Side of Motor, Showing Double Carburetor.

Bronze to Steel Emergency Brake and Its Housing.

are removed with the bearing and the shaft, so that the opening in the front end of the case is of sufficient size to let the remaining bearings, with their bushings, pass through with ease. The same practice is followed with the bearings for the crankshaft. The compression release scheme, to assist in starting, consists of a set of four relief cams on the camshaft, operated by the movement of a rod by a pull at the base of the radiator.

Details of the Stearns Fuel System.

The most striking evidence of the painstaking attention that has been paid to every detail of the Stearns car is to be found in the carbureter, which is an evolution that is the product of two or three years' study. Its basic principle of design is that of providing a varying amount of fuel as well as air, in accordance with the power required of the engine, this being a development made necessary by the demand for large and powerful motors. It was found imperative to depart from currently accepted designs in order to accomplish this result, and as a matter of fact nothing on the car has received more attention than the carbureter, to which the designer attributes no little part of the smooth running of the motor. It is of the twin-nozzle type, the smaller nozzle, which has a fixed opening, located in a mixing chamber of its own, generating up to 30 horsepower, the larger nozzle having two orifices and being brought into use when power and speed above that furnished by the smaller one only are required. This carbureter offers four methods of control over the mixture, all of which are mechanically effected from a lever on the steering wheel. The controls are, briefly, as follows:

First, to keep the motor just turning over when the car is standing. Air enters through a fixed air opening. This air rising past the nozzle, passes up through a tube and then through a small opening regulated by a cone tipped adjusting screw; thence it finds its way to the motor. The exact amount of mixture permitted can be regulated by the adjusting screw.

Second—When starting the car, after it has been standing by the curb with the engine running, a plunger is depressed by means of the control from the steering wheel. Depressing the plunger opens a valve which allows the mixture passing the main nozzle to follow the main outlet instead of going through the by-pass channel, as in the first case. This allows the full capacity of the small mixing chamber to pass to the motor, and to supply air for this the automatic valve is brought into action. With this arrangement it is possible to secure 30-horsepower from the motor.

Third—Should still more power be demanded, the plunger is further depressed. This opens a valve and immediately the big nozzle is brought into action in that the motor suction brings air past the large automatic valve.

Fourth—Should still more mixture be desired, the plunger is depressed still further, until it forces the expanded end

of it upon the top of a tubular stem of a special valve in the upper part of the larger mixing chamber, and opens this valve, thereby giving the maximum amount of mixture to the cylinder.

The expanding clutch which has been used on Stearns cars for several seasons has been retained intact. There are two expanding shoes in this clutch, each being semicircular and secured at one end to a fixed piece and at the other end to a swinging support. The expanding shoes are leather faced.

Ball Bearings Throughout Transmission.

In the Stearns gearset the use of a four-speed selective set with direct drive on the fourth speed is continued. This gearset remains practically as it was in 1907, except for change in the design of the case to give compactness and add strength. In all, thirteen DWF bearings are used. A universal coupling is interposed between the clutch and gearset. Side-chain drive is continued, and the adjustment of the chains consisting of a radius rod, swiveled at its rear end of the axle, and hinging at its front to a member with a spur to which the rod attaches. Threaded into this sleeve is a rod which is adjusted by a nut and locknut. One of the illustrations shows the expanding shoes of the emergency brakes, which are bronze segments that act against the interior force of the steel drum on the wheel.

The improvements in the running gear largely center around the steering knuckle, although the frame has been dropped 2 1-2 inches in front of the rear axle to give a lower body carriage; except for this the side members are straight from end to end. In the steering knuckle the great change is the forging in one piece of the spindle *A* for carrying the wheel, the hub portion *B* forming the pivot, the arm *E* with ball end for connection with the tie rod to the opposite knuckle and the knuckle arm *C*, which connects to the draglink *D* that couples with the steering gear. New also is the use of the DWF bearing in the top of the knuckle, which carries the weight of the car. After making these four parts, *A*, *B*, *E*, *C*, integral, it was necessary to make the opening in the lower end of the axle jaw of sufficiently large diameter so that the hub *B* could be pushed through the opening until the top of the hub was free to enter the opening in the top of the jaw. Bushings are used for filling the extra space in the lower arm of the jaw. The steering gear has been improved by increasing the strength and size of all its parts. It is a worm and pinion gear, and is supported on the headplate which carries the magneto. A pronounced improvement consists of carrying the draglink *B* high and outside of the frame, so that it parallels the side member, thereby occupying a position of safety.

A critical examination of the design and constructional details of this year's representative of the Stearns is strongly indicative of an advanced trend, particularly where the motor is concerned, simplicity and compactness forming the keynote throughout, as is evident from the manner of placing the accessories, the radiator mounting being a particularly noteworthy feature.

Novel Arrangement of Water Pump and Lavigne Oiler.

A TWO-DAY TRIP IN SOUTHERN CALIFORNIA

PASADENA, CAL., March 11.—There were just thirteen in the party, and two Packard "30's" were utilized for the 207-mile jaunt. The presumably unlucky total number of tourists, however, had no effect upon the spirits of those participating, and the weather was such as only California can produce in February. It was a quiet, domestic tour, the families of J. M. Murdock, of this city, and L. S. Hackney, of St. Paul, Minn., making up the party.

Start was made for the two-day trip on a Friday morning and a southeasterly course was taken, with Riverside as the goal of the first day's run. A St. Valentine's day lunch (for it was February 14) was eaten in the open, when the noonday halt along the road was made, and the picknickers are the subject of the first snapshot which illustrates the story. The next picture below and the one in the lower right-hand corner of the page show both the Packards in action as they forded a small stream near Arcadia, some miles out on the first day's journey.

The road to Riverside skirts the foot-hills of the San Bernadino range, some 30 miles to the east. Riverside is the head and center of one of the richest orange-growing sections in the world, and the county seat of Riverside county. It is 65 miles east by south from Los Angeles, and is noted for its beautiful streets and surroundings. Here the party stayed over night at the Glenwood Hotel, and next morning started from the Mission Garage, for Redlands, Highlands, San Bernadino, and home. The winding road up Huntington drive on Mt. Rubidoux was taken out of Riverside, and two of the illustrations show the cars on the route. A photo of the party was taken at the summit of the mountain. As the road approaches the city of San Bernadino the mountains increase in grandeur, and the scenery is magnificent. The city which stands near the site of an abandoned Spanish mission of the same name has a bit of interesting history as a municipality. It was founded by a company of Mormons in 1851, who wished to establish a way station for the emigrants to Utah by way of the Pacific route. It was incorporated in 1854, but on the withdrawal of the Mormons,

in 1857-58, its importance declined so rapidly that it was dissolved in 1861. In 1863 its charter was restored. The population has increased rapidly, until now it numbers about 7,000 souls. The town is also noted for its mud baths.

The route of the trip carried the party into three counties. Counties in Southern California mean more in dimensions than they do in the Eastern States. San Bernadino is the county seat of the county of that name, the largest in the State, covering an area of 19,947 square miles, and extending from the city of San Bernadino, which is situated in the southeast corner, to the Colorado river, almost 200 miles away to the east, and north about 110 miles, to the Inyo county line. Practically all that is inhabitable of San Bernadino county is the southwest corner, west of the mountain range. The rest is desert land, hot and dry, the Mojave desert and sink of Mojave occupying a great part of the vast area.

Riverside county is also a garden spot in the western part and a desert in the east. It is about 40 miles broad from north to south, and borders San Bernadino county on the south its entire length. The county of Los Angeles, however, secured the bulk of the trip. It is the real "American Italy," the paradise of the tourist, and the ideal home of the all-the-year-round automobilist. If there is any touring ground the world over that can surpass Southern California in anything but the matter of roads we have yet to find it, and the countless hundreds who make an annual pilgrimage across the ocean to enjoy the delights of French and German scenery and historic resorts, will find a vast amount to interest them here at home, if they only knew it. Of course, there are not the miles and miles of straight and level highways that distinguish Continental Europe, where lenient regulations make "letting her out" a delight that can be indulged in on every occasion that the reasonable handler of the wheel could possibly desire to do so. This is a drawback, but this part of California can never have such roads, regardless of the amount she is willing to spend on improvements and construction, as the country is much too mountainous.

Typical and Picturesque Scenes Along the Route of a Two-days' Tour in Southern California.

BOOKS FOR AUTOMOBILISTS.

Ignition Troubles; Effects, Causes, Etc.—This is the title of a booklet from the pen of Harry Eisner, E.E., of Boston, Mass., who has treated the subject in a concise and clear manner, so that the man who has had no experience whatever can understand the subject matter and follow it by means of the numerous standard wiring diagrams which form part of the work. Every form of ignition apparatus at present in current use is briefly touched upon. The pamphlet is being distributed by the Gordon Automobile Supply Company, Inc., 1024 Boylston street, Boston, Mass.

An Automoblist's Diary.—Of a convenient form, carefully compiled and well produced, the Automoblist's Diary and Reference Book for 1908, from Case & Hechinger, Boston, should be well received by the touring automobilist. A tabulated table is given for each day of the year, with blanks for filling in such matters as are likely to be useful or interesting for future reference. In a small form there is a mass of information valuable to all drivers of a car. The diary is well bound in leather.

A Romance of the Automobile.—In eight honks and one crash, Julian Street paints with considerable skill a picture of his first motor experience, in a publication from the John Lane Company, New York, entitled "My Enemy the Motor." It is a somewhat grim sort of a romance—if grimness and romance can be associated—but the telling of it is well done, the locale excellent and the illustrations an embellishment. Mr. Street is now driving his second Locomobile, and lives at Greenwich, Conn.

Curing Automobile Diseases.—In the hands of the automobile doctor the disease of the gasoline-propelled vehicle appear to multiply as rapidly as ills of the flesh. Certainly A. L. Dyke in his "Diseases of the Gasoline Automobile and How to Cure Them" has unearthed enough to satisfy the most rabid trouble hunter. The book is obtainable from the Phoenix Supply Company, St. Louis, Mo.

TESTING CARS UNDER WINTER CONDITIONS.

Heavy snowfalls add to the work of both the tester and the car which is being put through its initial work-out on the road, but that they do not deter either from undertaking their daily round of work is evident from the accompanying photograph showing a couple of Premier testers, a few miles from the Premier factory in Indianapolis. Contrary to the usual order of things during the past few months, the Premier Motor Manufacturing Company has been running its entire plant in full swing, and has even found it necessary to do a great deal of overtime work so that the reasons for putting cars to the test as fast as they were turned out will be apparent.

Testing a Premier on Indiana's Snow-covered Roads.

- July 20-30.....—Ardennes Circuit Races and Coupe de Liederkerk, Automobile Club of Belgium.
- Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusten Automobile Club.
- Sept. 1-8.....—French Volturette Contest, auspices of "L'Auto."
- Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

Ever-increasing Use of the Automobile as Evidenced by the Daily Scene in Dry Goods Shopping District of New York City.

CONVICT LABOR FOR ROAD BUILDING IN THE CAROLINAS

By F. S. SLY, TRAVELING CORRESPONDENT OF THE AUTOMOBILE.

CHARLOTTE, N. C., March 11.—There are about 125 cars in this city, and it has just received its first automobile truck, which is a Franklin, sold by O. L. Barringer recently to the General Fire Extinguisher Company.

There has been some talk of getting together and organizing a club, but as yet nothing has come of it, though the majority of the individual owners are enthusiastic autoists.

Here, as everywhere else in North Carolina, the county is using its convict labor to build macadam roads, and about 100 miles have already been constructed. The clay roads are very good in summer, but in wet weather they become almost impassable.

The dealers are O. L. Barringer, who handles the Franklin, Autocar, Cadillac, White, Pope-Waverly and Buick; the Charlotte Motor Car Company, who have the Ford, Rambler and Reo, and Hans and Ross, who represent the Maxwell. The first two firms are the only ones here maintaining garages.

SPARTANBURG, S. C., March 12.—This city claims to have more paved streets than all the other cities in South Carolina combined, and it certainly has many miles of fine pavement. For several years past Spartansburg County has been building about five miles of macadam road annually with convict labor, and, in addition to continuing this program, is now planning a

bond issue of \$200,000 to further the work of road improvement. Here, as elsewhere in the State, the soil is clay and becomes very bad in wet weather.

In the city itself there are about sixty cars, and F. S. Bryant is probably the most progressive autoist here, no club having been formed as yet.

The only garage is maintained by the Spartansburg Automobile Company, representing the Ford line.

GREENVILLE, S. C., March 13.—Although this city has a smaller number of cars than either Charlotte or Spartansburg, only being able to boast of fifty-five all told, it already has an automobile club, known as the Greenville Automobile Association, of which Perry Beattie is president; A. P. Hoke, secretary, and R. N. Tannehill, treasurer. At present the membership is thirty, and as Mr. Tannehill says the prospects are bright for a large number of sales this year, the future of the club is correspondingly so.

Garages are maintained by the Barr Hardware Company, representing the Maxwell, and R. N. Tannehill, handling the Franklin and Buick, while Nugent F. Bates represents the Cadillac. The roads are good in summer, and as is the case with neighboring counties, convict labor is being employed for their improvement.

LOUISIANA LEAGUE TAKES UP ROAD CONSTRUCTION WORK

NEW ORLEANS, March 16.—Local auto enthusiasts now realize that it is the lack of good roads throughout the South that prevents them from getting the much-coveted Glidden tour. To this fact alone they attribute their failure to get the 1908 tour. But if good roads will bring it, the Automobile League of Louisiana is taking the proper course, for they have started a campaign for better roads.

A movement has now been started to have the road between this city and Baten Rouge improved and placed in shape for traffic of all sorts. This road, which follows the Mississippi River, is one of the most picturesque in the State and would make an ideal course for short tours. The road is 125 miles long and without any great expenditure of money could be placed in excellent shape. To have this accomplished is now the aim of the Automobile League.

Last week a trip was made to Baten Rouge by a party from this city, headed by Palmer Abbott. The trip was made in the famous "Mudlark No. 3," which recently completed a tour from New York City to the Crescent City. For the first thirty-five miles out of this city they encountered all sorts of difficulties,

the road being in horrible shape. This was caused by the moving of the levee back, and the road is merely a trail through the plantations. The remainder of the road is in fairly good shape, being kept up by the plantation owners, all of whom are more than anxious that the whole road be improved.

Some time next week a party, composed of Palmer Abbott, G. E. Demack, Dr. Joseph M. Woodward and Dr. R. E. DeBuys, will start out in several machines and make this trip, visiting each parish. The authorities in each parish will be interviewed and asked to co-operate in the plan to improve the road, especially the first thirty-five miles out of this city, where it is in a horrible condition. The members of the various levee boards will also be seen and asked to do their share of the work.

"About all that is needed," said Mr. Abbott, "is to drain the roads on both sides with ditches and to run a traction engine over the roadway in order to smooth it. The matter will be pushed vigorously and local enthusiasts hope to have the road in excellent shape by the middle of the summer. This is not the only road that the Louisiana Automobile League have in mind, but they are going to make it a general State movement."

NO SINGLE CLUB CAN CONTROL HERE.

Obsessed by a name which has become misleading, vainly trying to have the club what it is not and never can be, a few now in control of the Automobile Club of America, finally disgruntled because its spokesman could not dictate the policy in legislation and other matters of the New York State Automobile Association, has seen fit to decree its resignation from that organization, which high-handed action also carries with it the severance of all relations with the American Automobile Association.

Recognizing the patent fact that only through local, State and national action can there be secured those things which add to the progress and enjoyment of automobiling, the growth of the American Automobile Association under the existing administration has been substantially cumulative. In union there is strength, but if the clubs of a State worked as separate units, and, inevitably, often at cross purposes, there would be little accomplished and results would be few and far between.

In France the Automobile Club of France, with headquarters in Paris, does "lord" it over the clubs of the provinces, and in Great Britain the Royal Automobile Club, located in London, is attempting to do the same thing, after a break with the Motor Union of Great Britain and Ireland, with indications that its plans will go decidedly amiss; in fact, negotiations are in progress for a readjustment of differences. But foreign procedure is seldom successfully transplanted to these democratic United States, and this was quickly demonstrated at Chicago in March, 1902, when the clubs there assembled—

Chicago Automobile Club, Automobile Club of New Jersey, Long Island Automobile Club, Rhode Island Automobile Club, Automobile Club of Philadelphia, Princeton University Automobile Club, Automobile Club of Utica, and the Grand Rapids Automobile Club—emphatically declined to accept the A. C. A. of New York City as the fountain head of government, although the Automobile Club of America was represented at the meeting. At that time A. R. Shattuck was the president of the A. C. A., and annually he visited Europe, and, perhaps, brought back ideas that he thought deserved transplanting.

But the American Automobile Association was born at Chicago with all clubs on an equality—each club casting its total membership vote and no more. In its early years the A. A. A. progressed spasmodically, always subjected to the scrutiny of those who would not have it interfere with the ultimate hope of A. C. A. supremacy. Several administrations of A. A. A. affairs gave little except unfulfilled promises and some dissensions that threatened its very existence.

Then came the Hotchkiss era and a leader surcharged with determination and enthusiasm. He took up the work the others had thrown down. Previously he had raised the New York State Automobile Association to a high degree of perfection—accomplishing it without any considerable aid from the inner circle of the A. C. A., for, let it be kept in mind, the members under a constitution which has been gradually "perfected" are not required to bother much with the conduct of the club. The self-perpetuating governors do that with an expertness which has earned the admiration of politicians.

Still nursing that deferred desire to "nationalize," the strongly entrenched clique of the A. C. A. has watched with unfeigned jealousy the growth of the A. A. A. into a national organization of dignity and far-spreading influence. An effort was made to get control of the Vanderbilt Cup, but its frank and fair-minded donor let it be understood without hesitation where he stood on that proposition. To this event—established mainly through the energy of the indefatigable Pardington—the A. A. A. owes much, for the race's 1905 and 1906 surplus furnished the financial sinews for carrying on the work of education and organization—a better use for the money than investing it in a big clubhouse.

It is well remembered by New York State autoists how they were nearly forced several years ago to accept a most obnoxious law, how Mr. Shattuck was "thanked" for his services at Albany, and then another committee undid what had been almost done. Once more we find Mr. Shattuck "legislating" at Albany, and now, despite the action of the State association on which his club had a member, we find this industrious automobile patriot insisting that larger fees should be paid than those contained in the bill of the State association. Of course, President Quayle resented this meddling, whereupon there followed the resignation of the A. C. A., thus indicating that that club is Shattuckian governed and consequently useless except as a means of employing the time of that self-absorbed toiler who at least deserves the credit of being honest in his misdirected endeavors.

But the A. A. A. will go on with its work, for it is founded in the needs of the hour. The A. C. A. may be rescued from ring rule, for many members are at variance with the present suicidal policy. Time alone will tell the story.

A. A. A. EFFORT FOR FEDERAL REGISTRATION

WASHINGTON, D. C., March 16.—Legislative hearings often mean nothing; their purpose frequently is to deceive rather than to enlighten. The session on Thursday last before the Judiciary Committee of the House of Representatives, with the Federal Registration Bill of the A. A. A. as the topic of discussion, was a hearing seldom seen, according to the opinion of experienced observers, and the masterly presentation of argument in behalf of the measure was undeniably brilliant, logical and grudgingly convincing to lawyers sharpened by contact with all manner of constitutional problems. Charles Thaddeus Terry, chairman of the A. A. A. Legislative Board, counsel of the National Association of Automobile Manufacturers and professor of law at Columbia University, was the man who bore the burden, concisely putting forth the claims of the proposed law, accepting with evident enjoyment the repeated assaults that came to him across the committee table and never losing his equanimity even when the questions were plainly intended to destroy the continuity of his really wonderful marshalling of the facts in the case. Chairman Jenkins, of Wisconsin, is understood to be a stickler in conforming to the Constitution, and at times it seemed to the automobilists that he was searching more for material to sustain his own deductions rather than to learn on what grounds the automobilists sought the right to go anywhere in this country after informing the Federal government that they had complied with the laws of their own States, and thus obtain a national passport.

The hearing was opened by President Hotchkiss, who briefly pointed out the necessity for interference on the part of the Federal government to protect the motorists of the nation while operating in those States which require the registration of non-residents and use the requirement as a means of taxation.

Chairman Terry Ably Presented His Argument.

The principal argument was made by Chairman Terry. It was practically conceded by the committee that legislation of the kind asked for was necessary, and that it should be accorded if Congress had power under the Federal Constitution to regulate the registration of motor vehicles when operated in States other than those of their owners' residences. It was apparent at the outset that the question being an entirely new one, and the powers of Congress being necessarily limited to its control over commerce between the States as granted to it by the Constitution, and as construed by the commerce decisions of the Supreme Court, the problem to be solved was whether Congress could in any way regulate the use of a pleasure vehicle, when operated on the highways of a State other than the State of the owner's residence; in other words, when engaged in interstate travel. It was apparent, also, that most of the members of the committee had grave doubts as to such travel being within the meaning of the word "commerce" in the Constitution. Hence, when it is stated that after a two hours' presentation by Mr. Terry, several members of the committee stated that while they had been very doubtful, they had been either wholly or almost convinced that Congress had the power to pass the Cock's bill, the high merit of Mr. Terry's presentation will be appreciated.

In substance his argument was that though the word "commerce" originally connected an interchange of commodities from State to State, the Supreme Court had from decade to decade widened the meaning of the word until it now included not merely trade but transportation, the interchange of telegraph messages, the carrying of lottery tickets on the person of a mere traveler, travel itself; in fact, intercourse between the States in the broadest possible sense of that word. It can be stated with some confidence that as to this the committee seemed to agree with Mr. Terry. In other words, he demonstrated to the committee that Congress had power to legislate concerning

the registration of the newest means of intercourse, or intercommunication, between the States.

Mr. Terry also called attention to a line of decisions by the Supreme Court, which held that under the commerce clause of the Constitution the Federal government had power to pass laws which would prevent one State from exacting license fees, tolls, or taxes, either from vessels or from their pilots or masters, when plying navigable waters entirely within a State other than the State where the vessel was enrolled, and called attention to the fact that there was in principle no difference between the natural highways of a State or nation, that is, the waterways and the dirt highways, and also that there was no difference in principle between a vessel navigating such natural highways and a wheeled vehicle using such artificial highways. Asked by Congressman Malby of the committee whether there was not a distinction between vessels engaged in interstate trade and purely pleasure vessels, Mr. Terry called attention to the case of the yacht "Yosemite," in which the Supreme Court held that there was no such distinction and that a vessel operated between ports of different States and purely a pleasure yacht, was properly subject to the law preventing exactions by States other than that of its enrollment, and that this statute rested solely on the commerce clause of the Constitution.

While the chairman of the committee and several of its members repeatedly asked questions which indicated that they had grave doubts as to the constitutionality of the bill, Mr. Terry's argument made a deep impression and entirely convinced several of the committee. It is not likely that final action will be taken on the bill for some weeks, owing to other matters pressing on the attention of the Judiciary Committee, but it is confidently expected by Mr. Terry and his associates that such action will ultimately be favorable to the bill.

Interviews with members of Congress not on the Judiciary Committee led to the conclusion that should the bill be favorably considered by such committee the bill will pass without substantial amendment or opposition. It is hoped that members of the American Automobile Association will continue to express their interest in the bill to their representatives at Washington, particularly those on the Judiciary Committee.

President Hotchkiss Headed a Representative Delegation.

It was a substantial representation that President W. H. Hotchkiss assembled at the Capitol, and they came from a dozen State bodies of the National organization. This president has proven the salvation of the A. A. A., which in the past has been led by men who have not had the time or the enthusiasm to do the big work properly. And right here let it be said that Secretary Elliott has been a conscientious factor in carrying out the plans of the president. The delegation present included the following:

William H. Hotchkiss, president American Automobile Association; Charles Thaddeus Terry, chairman Legislative Board, New York; Frederick H. Elliott, secretary American Automobile Association; Russell A. Field, Long Island Automobile Club, Brooklyn; A. G. Batchelder, New York State Automobile Association; C. H. Benedict, Automobile Club of Schenectady; Robert P. Hooper, Automobile Club of Germantown and Philadelphia; Paul C. Wolff, Pennsylvania Motor Federation and Automobile Club of Pittsburg; Jacob D. Rider, Lancaster Automobile Club; G. Douglass Bartlett, Quaker City Motor Club, Philadelphia; W. C. Crosby, New Jersey Automobile and Motor Club and Associated Automobile Clubs of New Jersey; R. A. Green, New Jersey Automobile Trade Association, Newark; J. H. Edwards, Automobile Club of Hudson County, Jersey City; William H. Hunt, Automobile Club of Hudson County; Walter S. Schutz, Connecticut State Automobile Association, Hartford; F. T. Staples, vice-president Connecticut State Automobile Association, Bridgeport; Robert B. Caverly and LeRoy Marks, Automobile Club of Washington, D. C.; Charles J. Forbes, Jr., Cleveland Automobile Club; Dr. A. B. Beyle, Cincinnati Automobile Club; Hon. F. H. Gillette, Automobile Club of Springfield, Mass.; L. R. Speare, Bay State Automobile Association and Massachusetts Automobile

Club, Boston; Osborne I. Yellott, Automobile Club of Maryland; John Bancroft, Delaware Automobile Association, Wilmington; F. E. Chapman, West Virginia State Automobile Association; George Ade, Indiana State Automobile Association; S. Boyer Davis, Automobile Club of Philadelphia and chairman of the legislative committee of the Pennsylvania Motor Federation.

The Professional Chauffeurs' Club of America was also represented by President Sullivan and ex-President Walters, with Xenophon P. Huddy, its counsel. The latter discussed the bill briefly, urging chiefly that it be amended so as to permit the Federal registration of chauffeurs while operating motor vehicles in States other than those of their residence.

President Caverley, Secretary Marks and Director Stoddard comprised the Automobile Club of Washington trio responsible for the entertainment of the visitors, the festivities including a smoker at the club's country home.

Congressman Cocks, who accepted responsibility for the bill

in the House of Representatives, isn't afraid these days to be seen in the company of automobilists. When one remembers the unpopularity which this thoroughly straightforward legislator once enjoyed when, in the early days of the industry he sought, as a member of the New York State Legislature, to obtain a statute which in the light of subsequent events seemed liberal at the time, his present championing of the rights of automobilists is not so remarkable after all. And there were other congressmen who were not afraid to dine with the autoists in the glaring electric light of the New Willard on Wednesday evening. These were Malby, Alexander and Moon. When the work of organization of automobilists has attained greater numerical strength there will be more legislators enough unafraid of their constituents to dine with autoists in public. In fact, it is not a wild prediction to make that if the Federal bill can emerge from the committee it will receive enough votes to become a law.

PROVISIONS OF THE PROPOSED NEW YORK AUTOMOBILE LAW

THE New York State Automobile Association, through President Quayle, announces that the new bill for the regulation and registration of automobiles in the State of New York conforms as nearly as is possible to the uniform automobile bill as suggested by the American Automobile Association, and which is now being considered by the Legislatures of Ohio and Massachusetts. This is the first step toward establishing uniform legislation. The marked differences between this bill and the present motor vehicle law are as follows:

First.—The bill provides for the annual registration of motor vehicles, and for the payment of fees sufficiently large in amount to be equivalent to taxation of those vehicles by the State. It is anticipated that the revenue derived from this taxation will return to the State, for the first year, from \$250,000 to \$300,000, with a substantial increase each year thereafter, as motor vehicles multiply. All of the revenue so obtained shall be paid to the special fund for the maintenance of State highways. The fees to be paid are to be based upon weight, and should vary from \$2.00 for the lightest vehicle to not more than \$15.00 for the 6,000-pound cars.

Second.—A positively thorough method of identification of motor vehicles when on the public highways is provided for in the provision that all vehicles shall hereafter carry numbers (front and rear), the said numbers to be changed in color each year, and to be issued and provided by the Secretary of State. Severe penalties are imposed for violations of this provision.

Third.—In addition to the usual provisions as to lamps, horns, etc., there is an entirely new provision prohibiting the use of non-skidding tire devices, except when the highway is covered with ice or snow, or in an otherwise dangerous condition.

Fourth.—The usual exemption for non-resident owners. The same prohibition against local ordinances affecting automobiles, as is in

the present law, together with a brief definition of permissive speed, which corresponds to that recognized in foreign countries, and very much like the provision of the Connecticut law, which is in operation to-day.

Fifth.—To assist local magistrates in enforcing the law as to the second and third offences, provision is made for the transmission of records of convictions, under the law, to the Secretary of State, who, in turn, is obliged to notify all the county clerks of the State of all speed violations. Along the same line there is a new provision requiring the Secretary of State to file with each county clerk a list of registered motor vehicle owners and registered chauffeurs, and to file each 30 days a supplemental list, showing registrations to date, to the end that local authorities may ascertain the identity of persons who violate the law and do injury to others while operating motor vehicles.

Sixth.—Beside the local penalties for violations, which are somewhat more severe than those at present in force, it will be possible to annul the certificate of registration of any vehicle that uses a fictitious number, and to suspend, for a period of time, the right of any chauffeur to operate any motor vehicle in case of convictions. In addition there is a provision making it a misdemeanor for any person to tamper with or use a motor vehicle without the consent of its owner. This provision will be much appreciated.

This bill is the result of many conferences between leading members of the legislature and representatives of the New York State Automobile Association, and it is thought to give effect to an understanding between representative interests, whereby the present law shall be brought up to date and made more easily enforceable, and whereby the motor vehicle users of the State acquiesce in the payment of an annual registration fee for the express purpose of maintaining improved highways.

OHIO LEGISLATORS WANT INCREASED FEES.

COLUMBUS, O., March 16.—Evidently the members of the Ohio legal mill are in favor of grinding more out of the owner of an auto than they have hitherto succeeded in doing, as the Ward bill, which calls for a license fee of \$3 for cars of 12-horsepower or less, \$5 up to 20-horsepower, \$10 up to 50-horsepower and \$15 above that, has already passed the Senate, and is now before the lower house. Dealers' licenses are to cost \$10 for each type of car, and chauffeurs' licenses will cost \$2, while fines of \$25, \$50 and \$100 and 30 days' imprisonment are provided for repeated offenses. These penalties are not alone for speed or registration violations, but also refer to the sections covering equipment, such as lamps, horn, etc., and compliance with rules of the road. The speed limits are 8, 15 and 20 miles an hour, respectively, according to the nature of the district, and reciprocal rights are granted to non-residents registered in their home States. Special penalties of a fine up to \$300 and 60 days' imprisonment are provided for carrying a fictitious number; \$100 and suspension of license for two years for failure by chauffeur to register, and \$200 for unwarranted use of another's car.

MICHIGAN'S STATE LAW NOT WELL ENFORCED.

DETROIT, MICH., March 17.—Some of those who hailed with loud acclaim the law requiring all owners of automobiles to secure a State license, thus taking the matter out of municipal control, are beginning to wonder whether, after all, the move was as good as at first supposed. Detroit's board of assessors, after struggling with the problem in an endeavor to get owners on the personal tax roll, are convinced the plan is not an unqualified success. Either the addresses of many owners were erroneously given to State officials or little care was exercised in making the entries, for, from the records, it is impossible to locate many owners.

Automobile owners have likewise shown a laxness, neglecting to notify the Secretary of State when they disposed of a car, so that the change could be made. As a result, many are credited with owning from three to five cars, when they have disposed of nearly all of them. Many mixups have already resulted, and further trouble is anticipated when it comes to collecting on the assessments made, owing to the difficulty of determining ownership.

QUAYLE HEADS NEW YORK ASSOCIATION FOR THIRD TERM

BUFFALO, March 13.—Something not entirely unexpected in view of recent developments came out at the meeting of the New York State Automobile Association, held in the rooms of the Automobile Club of Buffalo yesterday. The announcement was made of the secession of the Automobile Club of America from the State Association. This action is the culmination of a series of differences that have existed for some time, with a strong degree of unpleasantness, between the New York club and the State body of the national association.

From what was ascertained locally, the New York club has been chafing under the restraint of the national and State bodies with which it is affiliated. One immediate cause assigned is the bill which the legislative committee of the New York State Automobile Association has drawn up. This bill is a model one in many respects. It provides that automobiles shall be exempt from taxation as personal property, but shall annually contribute a registration fee to the State on the basis of \$2 for the first 1,000-pound weight, and 25 cents a hundred for each additional hundred pounds. This measure would bring about \$350,000 in revenue to the State each year.

There is a story current here that A. R. Shattuck, one of the governors of the A. C. A., entertained some of the Albany legislators at the Fort Orange Club in Albany, and told them that the proposed registration in the A. A. A. bill was too cheap for an automobile, and "his organization," the A. C. A., would stand for a yearly tax of from \$4 to \$40, according to the weight of the car. The Albany legislators routed up the legislative committee of the State association and demanded to know what was meant by proposing a tax of from \$2 to \$4, when "those

rich fellows in New York were willing to pay as high as \$40 apiece." It was then the work of the State association to show who was representing the automobilists of the State, the 35 clubs affiliated with the A. A. A., and extending from Yonkers to Buffalo, or the inside ring in the A. C. A. of New York City.

President O. A. Quayle, of Albany, maintained that Shattuck and the several governors of the A. C. A., who always attend meetings, never represented that organization. However, Shattuck got busy, and kept at it until he got the resignation of the A. C. A. offered. When the resignation was presented, a resolution regretting the action of the A. C. A. was adopted, and

the paper laid on the table. President Quayle made the declaration that before any law is enacted taxing an automobile any \$40 a year, it will have to pass over his dead body. He asserts that he will resign before he will stand for anything like that. The attitude of President Quayle was endorsed by President F. B. Hower, of the local club.

Officers of the State organization elected yesterday were: Oliver A. Quayle, re-elected for the third time as president; Charles Jerome Edwards, of the Long Island Automobile Club of Brooklyn, vice-president; C. D. Hakes, Albany, secretary, and N. M. Pierce, Buffalo,

Officers and Directors New York State A. A. at Buffalo.

The group includes President Oliver A. Quayle, Albany; Secretary Chauncey D. Hakes, Albany; Frank B. Hower, H. A. Meldrum, Dal H. Lewis, Norman M. Pierce, and Mr. Weaver, Buffalo; M. L. Ruder, Albany; J. W. Snowden, Peekskill; H. H. Franklin, Syracuse; D. A. Burtiss, Schenectady; S. C. Tallman, Auburn; George Forbes, Olean; L. H. Babcock, Norwich; J. B. McMurrick, Oswego.

treasurer, the accompanying photograph showing the officers.

The meeting approved the bill providing for highway improvement; also the State Motor Vehicle measure, drafted by the State Automobile Association. At the conclusion of the meeting the members were entertained by the members of the local club at a dinner at the Buffalo Club. Later, all attended the automobile show, held here this week. Further developments in the situation may be forthcoming at any time.

PRES. QUAYLE ISSUES STATEMENT ON A. C. A. MATTER

PRESIDENT OLIVER A. QUAYLE, of the New York State Automobile Association, has issued the following statement in relation to the differences between that body and the Automobile Club of America, relative to the matter of dues:

The constitution of the New York State Automobile Association provides, in the matter of dues, that they shall be paid bi-annually, at the rate of \$1.00 per club member, except that when a club shall have a membership in excess of 500 members, then no dues shall be paid upon such excess membership. The total club membership of the State Association at this time is approximately 6,000 members. Of this number 737 members of the Automobile Club of America have not paid dues, the Automobile Club of America paying no dues upon its membership in excess of 500. Seven hundred and twenty members of the Automobile Club of Buffalo have paid no dues, the Automobile Club of Buffalo paying no dues upon its membership in excess of 500.

The Automobile Club of Buffalo, recognizing the apparent injustice of such a provision, offered an amendment to the constitution, which would require all clubs to pay the same dues. As the number of clubs in the State Association is increasing, and as the membership in these clubs is likewise rapidly increasing, it has been necessary for me to explain upon many occasions why a club of 400 members were required to pay \$400 a year, when a club of 1,200 members were required to pay but \$500 per year.

This proposed amendment to the State Constitution is not for the purpose of increasing revenue. The State Association has no need for funds at this time, its income being entirely sufficient. It is merely intended to make more equitable the present provisions of the Constitution relative to dues, by requiring its 1,500 non-paying members (737 of which are represented by the non-paying membership of the Automobile Club of America and 720 by the non-paying membership of the Automobile Club of Buffalo) to pay dues, and reducing the dues from \$1.00 to 75 cents for all clubs.

The income of 75 cents per member on the association's full membership would produce a revenue equal to the dues of \$1.00 per member, on its present dues paying membership, leaving the State Association's annual income practically identical, and yet reduce the dues of club members 25 per cent.

The State Association, while mindful of the influence and prestige of its largest clubs, must give due regard to the small ones.

The club dues in every automobile club in the State of New York at this time (with two exceptions) is \$5.00 per year per member. Clubs are now paying the State Association \$1.00 per year per member, or one-fifth of their revenue. If, therefore, their dues in

the State Association could be reduced to 75 cents, they would be relieved of a considerable burden.

Therefore, I cannot reconcile myself in the belief that the resignation of the A. C. A. is precipitated over a matter of \$300 or \$400. Again, my personal acquaintance with many of the members of the A. C. A. is such that I know that an item of \$300 or \$400 could not occasion a difference of opinion. On the other hand, I am inclined to think that the real differences are over a matter of legislation, and I may desire to make a further statement in connection with the legislative situation after the convening of the legislature on Monday next.

HOTCHKISS SAYS NO SINGLE CLUB CAN LORD IT OVER OTHERS

RELATIVE to the resignation of the Automobile Club of America from the New York State Automobile Association, President William H. Hotchkiss, who was in New York last week, when asked his views, said:

"While the difference between New York's local club and the State Association proper, which is a body of forty clubs, including one at Buffalo as large as the local club here, have been brought to a head by the contemplated action of the State body, requiring the New York club to pay dues on a per capita basis of its full membership, the breach dates well back, and was opened by a conflict over matters of State policy in legislation.

"It is, perhaps, proper for me, as president of the American Automobile Association, to say that I do not regret the resignation, but welcome it. It is high time that motorists understand whether a mere name adopted in the infancy of the motor

vehicle in this country, and which has since become a misnomer, entitles any local club in any city, no matter how great, to lord it over hundreds of other clubs in other parts of the country. Indeed, the time has now come to determine whether the American Automobile Association represents those motorists or whether they are to be represented by a small clique of gentlemen who manage a local social club. I, therefore, hail the issue, and have no doubt of the result.

"The American Automobile Association is now composed of twenty-one State organizations, with an application in from the twenty-second State, and is represented by clubs in almost every State where motoring is general. It has absolute control of the sport in this country, and of all touring and technical contests, to say nothing of its premiership in matters of legislation, both national and State."

W. K. VANDERBILT, JR., UPHOLDS A. A. A.

Before leaving for his home in Buffalo, after returning from the legislative hearing at Washington, President William H. Hotchkiss, of the American Automobile Association, received assurances from William K. Vanderbilt, Jr., that he had no intention of withdrawing as a director of the Three A's, and that he would continue loyal to its interests, despite the withdrawal of the Automobile Club of America from the State Association, which carries with it a resignation from the A. A. A. Discussion of the situation has brought out the fact prominently that many of the members of the Automobile Club of America are not entirely in accord with the recent action of the club's governing board, and from his statement, Mr. Vanderbilt would appear to be one of these.

MARYLAND GOOD ROADS BILL TO PASS.

ANNAPOLIS, MD., March 16.—The good roads bill, which was recently introduced in the Senate by Senator Benson, and which, when passed, will give Maryland the best State roads in the country, has been approved by Governor Crothers, and will doubtlessly be passed this week. An amendment was offered to the bill by Senator Linthicum, which provides that all turnpikes near the city where toll-gates are located, and which are controlled by corporations, be condemned under the provisions of the law. Among those who were instrumental in having the bill brought before the legislature were the automobile clubs of Baltimore and Washington.

The idea of the Governor is to appoint a paid commission of six, three to be appointed by him and three to be taken from the Geological Survey. The Governor said that the work would be done under State control and under State supervision. The Governor, who is a member of the Survey, will be a member of the commission, and the other two will be Dr. William Bullock Clark and Dr. Ira B. Remsen, president of Johns Hopkins University. The three members are to be paid salaries, while the survey members on the commission will mean that the survey will have something to do with the construction of the roads, provided the paid members agree.

TIRE CHAINS BARRED IN FAIRMOUNT PARK.

PHILADELPHIA, March 16.—At its meeting last Thursday, the Fairmount Park Commission passed a resolution forbidding the use of tire chains on automobiles within the park limits, on the ground that the roads are liable to damage thereby. An exception was made of Belmont avenue, which will permit of Main Line residents and through-route tourists reaching Lancaster pike without removing their chains. To compensate in part for this prohibition, it was decided to substitute asphalt for the rough Belgian blocks on the north side of Girard and Parkside avenues, from the west end of Girard avenue bridge to the Belmont avenue entrance to the park. This will give access to Belmont avenue from the north for cars with chains on.

In this connection, the Quaker City Motor Club has officially protested against the awful conditions around the City Hall, where the Rapid Transit Company is about completing the subway loop. Between mud and Belgian blocks and patchwork asphalt, the going is something fearful, especially in wet weather. Another evil was called to the attention of the city officials—the stretch of Belgian blocks on the "Hump" on Broad street over the Reading Railway tracks at Huntingdon street station. The automobilists ask for an asphalt strip in the center or narrower ones at each side, to do away with the jarring and shaking their cars are subjected to while covering that short stretch.

INDIANA ACTION AGAINST RECEIVER POPE.

INDIANAPOLIS, March 14.—A petition was filed in the United States Court here to-day, asking that Albert L. Pope be removed as receiver for the Pope Motor Car Company. The petition was filed by the Northern National Bank, the National Bank of Commerce and the Bostwick-Braun Company, all of Toledo, and the Capital National Bank of this city. It is stated in the petition that the Pope Manufacturing Company is making a claim of \$800,000 against the Pope Motor Car Company. The petitioners state that they are creditors of the Pope Motor Car Company to the extent of \$240,000, and that Mr. Pope is negotiating to sell the Indianapolis plant for \$400,000, one-fourth or less in cash, and the balance on long time.

EARLY SPRING DOINGS OF THE AUTO CLUBS

A. C. C. ON THE NECESSITY OF ORGANIZATION.

CINCINNATI, March 16.—In the bulletin of the Automobile Club of Cincinnati, the advantages of membership in it are set forth in no unmistakable manner. Among other things said in endeavoring to persuade Cincinnati autoists to join the club are the following:

"There are two things which most deeply concern every user of the motor car. There are good roads and rational legislation. As individuals, there is but very little that any of us can do in securing either. Collectively, we can exert a powerful influence for both. It has been truly said that in this country the good roads question was never spelled with capital letters until the automobilists took hold of it. The automobile clubs throughout the United States are at present exerting a powerful influence in the shape of legislation for highway improvement. Good road officials all over the country recognize in the automobile clubs their best allies in their interests to improve the roads. Sam Houston, State Highway Commissioner of Ohio, came down from Columbus recently, to tell the members of the Cincinnati Club what the State of Ohio is doing now for good roads, and to ask the support and influence of the club in his effort to secure legislation by which the State will assume 50 per cent. of the cost of road construction and maintenance all over the State. At the club dinner held that evening, Mr. Houston stated that he found that the members of the automobile clubs were the men on whom he could most rely for support in his measure.

"The necessity of organization and unity of action to secure uniform and rational legislation is only too apparent when we consider that at present not only has each State a different law, but that also in many States one finds that each town has its own peculiar law regulating the use of the motor car, with resulting confusion to the automobile tourist. Automobile legislation will never be solved to the satisfaction of the motorist until, by unity of action, we secure uniform laws throughout the different States.

"Membership in the Automobile Club of Cincinnati includes membership in the American Automobile Association and the Ohio State Automobile Association, and the ten dollars paid as dues to the local club also pays the dues of the State and National organizations, and entitles all members of the Cincinnati Club to all the advantages derived from membership in these organizations."

ALBANY CLUB TO HOLD A FIVE-DAY RUN.

ALBANY, N. Y., March 16.—In accordance with the plan it has followed for the past two years, the Albany Automobile Club will hold a five-day run this summer, beginning June 20. The route will be to Greenfield, Mass., the first day; to Providence, R. I., the second day; New London, Conn., the third day, and to New York the fourth, returning to Albany by way of Waterbury, Conn., on the last day of the trip.

In connection with the prosecution of Justice of the Peace Van Ness, of East Greenbush, a suburb of Albany, for misappropriating funds received as fines, and which is being prosecuted by the club, through its attorneys, Bender & Hinman of Albany, a number of wall placards are being distributed to clubs and garages. These bear a request to all autoists who were fined in that hamlet at any time during 1906 and 1907 to communicate with the law firm mentioned, as by so doing they may promote the cause of justice and the welfare of the autoist.

A CLUBHOUSE SOUGHT FOR WILKES-BARRE.

WILKES-BARRE, PA., March 9.—Almost as soon as a suitable site or building can be secured, the Wilkes-Barre Automobile Club will possess its own club premises. One of the best propositions now being considered is the old Wilkes-Barre and Eastern railroad station, on West Market street, and adjoining Nesbitt Park. When improvements have been carried out this building would be an excellent one for automobile club purposes. A scheme has also been brought forward by which the automobile club should co-operate with the recently formed Amateur Driving Club in securing joint headquarters large enough to accommodate both organizations, as this would permit of better facilities being procured.

ACKNOWLEDGES QUAKER CITY M. C.'S OFFER.

PHILADELPHIA, March 16.—Thursday last the Quaker City Motor Club received from the National Government an official reply to its offer to organize an emergency corps of automobilists, to serve in defense of the nation when called upon. The letter from the Assistant Secretary of War follows:

WAR DEPARTMENT.

Washington, March 12, 1908.

H. C. Harbach, Secretary Quaker City Motor Club.

Dear Sir—I have the honor to acknowledge the receipt of your letter of February 22, 1908, addressed to the President of the United States, and inclosing a preamble by your club offering the use of its motors and the services of its members as an auxiliary force to the Federal Government in case of insurrection or foreign invasion. Upon receipt of your letter the President referred it to the War Department for suitable acknowledgment. I beg, therefore, to express the appreciation of the President and of the War Department of your patriotic action in this matter, and to say that, should an emergency of the nature indicated in your preamble arise, the generous offer of your club will be borne in mind.

(Signed),

ROBERT SHAW OLIVER.

Assistant Secretary of War.

ARKANSANS ORGANIZE—STATE BODY COMING.

LITTLE ROCK, ARK., March 14.—At a meeting of the automobile enthusiasts of this city, held last Monday afternoon at the Real Estate Exchange, the Automobile Club of Little Rock was organized with the following board of officers: President, Moorehead Wright; first vice-president, J. P. Runyan; second vice-president, J. N. Heiskell; secretary, Irving S. Hirsch; treasurer, Perry Stiff. The officers named, together with E. P. Ladd, C. A. Pratt, J. E. Osborne, W. B. Miller and J. A. Van Etten, constitute the board of directors. The club will be incorporated under the by-laws of the American Automobile Association, and a State body will be formed. Capt. C. A. Pratt has been named as State director, to represent the local body in the national association. It is planned to organize clubs at Fort Smith and Pine Bluff, and perfect the State organization.

FAIR QUAKERITES TO ENDOW A HOSPITAL BED.

PHILADELPHIA, March 9.—For an exceedingly young organization, the Quaker City Ladies' Motor Club is certainly an exceedingly spunky one. With a rather limited membership list, it has set about to endow a bed in the Garretson Hospital for those injured in autoing accidents. They are gathering in the funds quite rapidly, but, to expedite matters, decided at last week's meeting to call on their brothers, husbands and friends in the Quaker City Motor Club to lend a helping hand. The work is now booming, and the "automobile bed" will be a reality within a few weeks.

DELAWARE ASSOCIATION BEGINS ACTIVE WORK.

WILMINGTON, DEL., March 16.—At a meeting held here during the past week the Delaware Automobile Association decided to undertake the work of marking the roads, and will have finger boards giving directions and distances at the intersections of the principal roads throughout the State. This is something in which Delaware has been lamentably lacking. The association has just issued its 1908 year book.

FIRST BANQUET OF YALE AUTOMOBILE CLUB.

NEW HAVEN, CONN., March 16.—The first annual banquet of the Yale Automobile Club will be held at the University Club next Wednesday evening, and will mark the opening of the auto season for 1908. Hill-climbing contests and race meets at the Branford Driving Park will follow. The Yale club is one of the largest of its kind in the East.

The Thomas Crossing Medicine Bow River, Wyo.

Buffalo Bill's Daughter Greet's Thomas at Hershey, Neb.

Through Snowdrift near Rock River, Wyo.

THOMAS CAR CROSSES NEVADA LINE.

COBRE, Nev., March 17.—The Thomas New York-Paris car reached this place at 8:48 P. M. to-day, making 182 miles from Ogden, Utah. Sandstorms were encountered, which, owing to unsuitable goggles, made driving very difficult.

Upon arriving at Cheyenne, Wyo., Montague Roberts, the Thomas driver who has made such a successful fight against odds that have kept his foreign competitors far to the rear, relinquished command of the car in order to return to New York, as he is scheduled to drive in the Briarcliff trophy race and other events of the season. E. Linn Mathewson took charge, and drove the car as far as Ogden, Utah, which was reached last Tuesday, where he turned the Thomas over to Harold Brinker, of Denver, who will take it through to San Francisco, Captain Hansen, late of the De Dion team, having signed on to cover the Alaskan and Siberian portions of the route. The Thomas arrived at Bitter Creek, Wyo., on Wednesday of last week, having covered 2,300 miles, its closest competitor, the Zust, then being 422 miles in the rear. The river is 15 feet deep at Bitter Creek, the wagon bridge was down, and it was too risky to try the railroad bridge, so, after struggling down the steep bank, the car was run across on the ice, which was eight inches thick. Granger, Wyo., was reached Thursday night, having covered ninety miles, in spite of the fact that the Thomas crew and car have frequently been called upon to come to the rescue of the pilot car. At Thayer Junction, it was necessary to ford Bitter Creek, as the ice was not strong enough, but the Thomas plowed through two feet of mud, water and floating cakes of ice without any trouble.

At 10:45 P. M. Friday, the Thomas rolled into Evanston, Wyo., making its total mileage 2,460. Some forty-odd miles of this were covered over the Union Pacific right of way, including a run through the tunnel at Aspen Ridge, saving many days' work of snow shoveling, as the drifts in the mountains, which are 9,000 feet high, reached ten feet in depth. Saturday's total was disappointing, ten hours' fighting through snow and mud only advancing the car 20 miles, but no stop was made, and after 25 hours' continuous running, the Thomas arrived at Ogden at 9:30 A. M.

At that time the Zust was at Rawlins, Wyo., the De Dion at Omaha, Neb., the Protos at Ames, Ia., and the Motobloc at Tama. This gave the Thomas a clear lead of 310 miles, but before leaving Ogden at four the next day, the Zust had cut this down to 226 miles, and the others had advanced from 60 to 98 miles, the Protos making the best showing. The mileage for the last seven days is as follows:

Car.	Country.	Day. 29.	Day. 30.	Day. 31.	Day. 32.	Day. 33.	Day. 34.	Day. 35.
Thomas (America)	2,300	2,390	2,460	2,480	2,536	2,536	2,718
Zust (Italy)	1,878	2,052	2,109	2,186	2,226	2,310	2,360
De Dion (France)	1,386	1,516	1,524	1,524	1,536	1,582	1,690
Protos (Germany)	1,262	1,332	1,369	1,369	1,369	1,467	1,536
Motobloc (France)	1,101	1,181	1,263	1,262	1,313	1,394	1,439

MOTORING A LA CHAFFRAY.

Saint Chaffray announced that he would ship his car by freight to Seattle on March 5, to catch the steamer to Valdez. He stated that the first car to arrive in Paris would be the winner. Roberts says he does not propose to make a freight contest of the New York-to-Paris race.—News item.

"Arouse, brave comrade, Autran;
There's work to do, allons!
Make haste with boards and hammer
To crate the De Dion.
A bas! the frightful highways
That wrought us much dismay!
We tour henceforth by freight car,"
Quoth Bourcier Saint Chaffray.

"Before us rise high mountains
Our onward way to bar,
Those Rockies and Sierras
Reject our touring car.
But courage, my brave Autran!
Behold, a better way!
We'll scale them on a flat car,"
Says Bourcier Saint Chaffray.

"The wilds of dire Alaska
Shall not us terrorize;
Though trails comprise the highways
And snowdrifts touch the skies.
A railroad goes from Valdez;
Will it not be a fait
To motor in a box car?"
Asks Bourcier Saint Chaffray.

"Those drear Siberian tundras
Where Desolation reigns
Shall daunt not Bourcier's courage
But yield to Bourcier's brains.
That Trans-Siberian Railroad
From snow is clear by May—
We'll go by freight to Moscow,"
Cries Bourcier Saint Chaffray.

"Then hasten, my brave Autran!
Pack up the broken springs,
Collect the drive-shaft fragments
With other injured things.
Discard the pick and shovel,
They now are much passé.
The fastest freight for Paris
Gets Bourcier Saint Chaffray."

—T. J. Sullivan in "Buffalo Evening News."

When the Gearless Returned Home from its Piloting Trip.

Arrival of the Gearless Greyhound at Rochester from Chicago after having acted as pilot car for the New York-Paris contestants. Distance covered, over 1,800 miles.

NEXT WEEK INDIANAPOLIS HOLDS FORTH.

INDIANAPOLIS, March 17.—Practically all arrangements have been completed for the second annual automobile show, which begins next Monday and will continue throughout the week.

Because there is no building large enough for a combined show, each dealer will exhibit in his own garage, from where special demonstrations will be made. Factories will also keep open house, and tire and accessory manufacturers are arranging for special demonstrations.

There will be a number of public events during the week, in which dealers and drivers from all parts of the State will unite. On the opening day there will be a parade, in which at least 200 automobiles will participate. It will be headed by the police automobiles and a five-ton truck carrying a band. Each automobile appearing will bear a card of uniform size, giving the name of the car, price and the local agent.

On Tuesday morning, at 11 o'clock, the hill-climbing contest will be held at Michigan Hill, northwest of the city. There are about fifty entries, and a special contest has been arranged for trucks and delivery wagons.

The obstacle race, on Friday afternoon, will be held on the Capitol Avenue boulevard, and about forty entries have been made. The closing feature will be a love feast and smoker at a local hotel for the dealers.

"Sealed-Bonnet" Mora Wheel Deep In the Snow.

MORA CAR'S STRENUOUS WINTER TRIP.

Not content with having some 8,000 miles under sealed-bonnet conditions last season to its credit, the Mora car, which successfully took part in the first sealed-bonnet contest run by the Automobile Club of America, and every one since then, was started from Rochester, together with the New York-Paris contestants. The Mora met with several accidents last summer, such as the smashing of a wheel, breaking of the steering gear connections and part of the radiator, but repairs to these parts were carried out without interfering with the original seals placed on the bonnet by the officials of the Chicago Motor Club last June. The Mora left Rochester at noon on February 16, in company with the Zust, but as the latter went into a shop for repairs, the Mora kept on to Buffalo, where it joined the Thomas and De Dion the same afternoon.

The story of its trip westward from Buffalo is that of a continuous struggle against almost overwhelmingly adverse conditions for every step of the way, during the course of which the Mora crew and car used their efforts in helping out first one and then another of the contestants in the New York to Paris run. On one day the total distance covered was seven miles. Chicago was finally reached, after many mishaps and hardships, and the day following the arrival of the Mora, the technical committee of the Chicago Motor Club, who sealed the bonnet last June, inspected the seals and certified that they had not been disturbed since originally placed on the car on June 19, 1907, so that the Mora was enabled to add 650 miles to its world's record of 8,000 miles under sealed bonnet conditions. Some idea of what the going was like for a large part of the way may be gained from the photograph showing the car almost out of sight in the snow.

Governor Hughes Entering White Steamer, Boston.

Last week New York's Governor visited the Hub, and did all his traveling in the White car, placed at his disposal by the local reception committee.

ELMORE SHOWS STRIKING ECONOMY FIGURES.

With a view to demonstrating beyond the shadow of a doubt the economy of the Elmore car, the makers selected 16 Elmore owners at random from those in Detroit, Mich., for the purpose of ascertaining exactly what their expenses had been for repairs. These 16 owners had traveled a total of 132,650 miles, and in covering that tremendous distance had expended all told, for repairs, the sum of \$26.95. The following gives the distances covered and the repair cost in each instance. All the owners are residents of Detroit:

Miles.	Years in Use.	Repairs.	Owners.
12,000.....	1	\$1.05	Dr. E. B. Smith
6,500.....	1	.05	Dr. F. S. Kiskadden
4,800.....	1	.50	Chas. W. Munz
5,000.....	1	.10	Dr. F. W. Young
8,500.....	2	.75	John K. Smith
7,200.....	1	1.35	Miss Mabel Wright
7,000.....	1	1.60	W. H. Allen
4,750.....	1	1.10	W. F. Barr
8,000.....	1	1.00	M. Caley
8,200.....	1	.50	John Trost
10,000.....	2	5.75	F. Peckencher
6,200.....	1	.25	Mat. Heldrath
18,000.....	2	5.90	J. J. Miller
3,500.....	1	.50	Perry Hibbard
14,000.....	3	4.75	Thos. H. Van Loch

The Mora Arriving at the Chicago Automobile Club.

Studebaker Delivering Message to Col. Loughborough.

SUCCESSFUL TRIP OF THE STUDEBAKER.

For the last few hundred miles of its trip, the Studebaker car and its crew, which were sent on a war mission, bearing dispatches from General Grant at Governor's Island, New York City, to Colonel Loughborough at Fort Leavenworth, Kan., received one continuous ovation. Farmers had notice of their coming well in advance, and lined the roads to see them pass, flags being displayed at various places. At Atchison they were accorded an elaborate reception, including a banquet. This point was reached at four o'clock in the afternoon, and the drivers were compelled to halt for a few hours. Fort Leavenworth was reached before noon the next morning, and the dispatches formally delivered to the commandant of the post, as shown by the accompanying photograph. Just to show that the Studebaker was as good as ever, Jack Huger drove it to Kansas City, through 26 miles of mud, in an hour and a half, on the following day.

FIRE FIGHTER FOR PENNSYLVANIA BRIGADE.

Massachusetts and Minnesota have united in the production of the automobile fire engine recently handed over to the Radnor Fire Company, of Wayne, Pa. A stock model D-6 chassis, manufactured by the Knox Automobile Company of Springfield, Mass., furnishes the power necessary to reach the scene of operations in the shortest possible space of time. The power plant is the standard two-cylinder horizontal opposed air-cooled motor, capable of driving the fire engine at a speed of 15 miles an hour.

The Knox-Waterhouse Automobile Fire Engine.

On this chassis the Waterhouse Engine Works Company, of St. Paul, Minn., has mounted a water-cooled four-cylinder vertical 45-50-horsepower motor, directly connected to one of their rotary pumps having a capacity of 360 gallons per minute. The weight of the entire outfit, including suction hose, play pipes, etc., is 6,200 pounds.

AMERICAN TAXIMETERS NOW ON THE MARKET.

The American-built taximeter has now come forth as a serious rival of the foreign instruments which for a few months were the only distance and fare recorders in use in the United States. Manufacturing under a patent owned by the Taximeter and Cab Company of America, the Westchester Appliance Company is now producing the recording machine illustrated herewith. The selling rights are controlled by the Ajax-Grieb Rubber Company, with New York headquarters at Fifty-seventh street and Broadway.

According to a statement by Horace DeLisser, president of the company, a first order for 2,600 of these taximeters has been received, each instrument working at a tariff of 50 cents a mile. A further order is said to be pending for a series of instruments working at the New York rate of 30 cents for the first half mile, 10 cents for each additional quarter, and 10

Views of the New Ajax-Grieb Taximeter, "Vacant" and "Engaged."

cents for every six minutes of waiting. The Ajax-Grieb taximeter records the number of trips, the total cash for the day, total number of miles covered, and each individual fare.

TRADE LITERATURE THAT HAS COME TO HAND.

Maxwell-Briscoe Company, Tarrytown, N. Y.—"Faith and Its Realization, the Story of an Industrial Accomplishment," is a narrative of more than usual interest, dealing with the history and beginnings of the Maxwell-Briscoe factory at New Castle, Ind. There are some excellent illustrations of scenes at the inauguration of the factory, when Vice-President Fairbanks, himself a native of the State of Indiana, laid the corner stone and made an address upon the rapid development of the national industries and the solution of national problems.

New York Gear Works, Brooklyn.—Without undue verbosity, but sufficiently in detail to suit the motor boat enthusiast, and illustrated sufficiently to make it readily comprehensible, this company presents its Ball improved reverse gear for marine work. Included are tables of dimensions giving weights and prices of the different gears, as well as other data required for the selection of a gear to suit the requirements of certain sizes and types of engines and boats.

York Motor Car Company, York, Pa.—A study in brown and gold has been adopted as the cover of the new catalogue of the Pullman car, manufactured by the York Motor Car Company. The catalogue stands high as a trade publication, giving just the information desired by automobilists and prospective buyers and being artistically produced.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

On March 12, at Milwaukee, S. W. Hartley, designer of the Cleveland car, driving "Old Scout," the first of the 1908 Cleveland cars, came in victorious in the three-day endurance run. As it was the first of its kind, this Cleveland has been used as a testing car ever since its completion and has covered more than 30,000 miles since last August.

According to figures given by the Quaker City Automobile Company, of Philadelphia, the average cost of repairing Franklin cars during a period of fifteen months has been \$7.50. The company guaranteed to repair all 1907 model Franklins free of charge from October 1, 1906, to January 1, 1908, and the low figure in question represents the cost of living up to their guarantee.

Much has been said and far more written concerning the care of pneumatic tires, but it is a subject that cannot be overdone, so that the booklet just issued by the Goodyear Tire & Rubber Company, of Akron, O., entitled "The Care of an Auto Tire," is timely. That it is likewise to the point goes without saying, as it contains the experience of skilled tire makers and users condensed for practical use.

The Logan Construction Company, of Chillicothe, O., has been shipping a large number of trucks recently to representative houses, among them a Model T ton truck to the Allen Carpet Cleaning and Rug Weaving Company, Buffalo, and another of the same model to Peter Peterson, furniture mover, Milwaukee, Wis. Inquiries for commercial cars are reported as plentiful in the Central and Middle West.

A. P. Henley, traveling representative of the H. H. Franklin Company, who has just returned from an extended trip to the Pacific Coast, says that farmers are buying automobiles. Crops were good last year, prices were high and the farmers have money. The owners of the big ranches find there is nothing to equal the automobile for covering the ground effectively and they are buying machines that are built to stand the racket.

"The Fairweather Club" is the title of a recently formed "eating" organization mainly composed of prominent agents and branch managers of New York's "automobile row." It will give its second dinner in honor of Colonel K. C. Pardee, the Maxwell distributor, at the Hotel Cumberland, Fifty-fourth street and Broadway, April 1. Henry M. Duncan, of the J. B. Brewster Co., will preside, and among the speakers will be Messrs. Cresswell, McLaughlin, John S. Crosby and Colonel Pardee.

The H. H. Franklin Company, Syracuse, N. Y., last week awarded as a prize a fine gold watch to Irving R. Gardiner, superintendent of the auto department of C. H. Childs & Company, Utica, N. Y. The contest was open to all Franklin dealers, the prize being offered for the best ten reasons why a buyer should select the Franklin. Mr. Gardiner's reasons were as follows: "Durability, beauty, elasticity, reliability, air-cooling, accessibility, economy, lightness, high-power and pre-eminence, a short statement being given under each one of these heads.

The businesses operated by the United States Automobile Company, on Plym-

outh avenue, and Fred Mabbett, on Main street, Rochester, N. Y., have been consolidated under the name of the former, and Mr. Mabbett will be general manager. The company's capital stock has been increased from \$200,000 to \$400,000, and the officers are: President, Harry S. Woodworth; vice-president, J. Foster Warner; secretary-treasurer, Charles F. Garfield. The company's establishment on Plymouth avenue is the largest of its kind in New York State outside of the metropolis.

W. E. Flanders, former general factory manager for the Ford Motor Company, and Thomas Walburn, former superintendent of the same concern, have recently become associated with the Wayne Automobile Company, Detroit, Mich., as stockholders. A reorganization of the latter company, has been effected, B. F. Everett still remaining at its head, and with Messrs. Flanders & Walburn, having the management of the concern. Mr. Everett is still president and sales manager, while Mr. Flanders will act as general manager. C. L. Palms, Dr. J. B. Book and William Kelly, who were heavily interested in the old company, remain as stockholders. It is proposed to manufacture on a larger scale than hitherto.

Harry G. Smith, of the Cleveland branch of the Diamond Rubber Company, who had charge of the Diamond supply car in the A. A. A. tour last summer, is captain of the Diamond tire camp on the course at Savannah for the races this week. Twelve of the seventeen cars entered are equipped with Diamond tires, and all but two also use the Diamond demountable rim. The rules require that the driver of the car or his mechanic must make any necessary tire changes, and there will be little for the Diamond crew to do excepting to supply such equipment as may be found necessary. The machines using the Diamond product include the Appersons, Stearns, Thomas Detroits, Thomas Flyer, Lozier, Pennsylvania and American.

NEW AGENCIES ESTABLISHED.

Logan commercial cars and the semi-racer runabout will be represented in Rochester, N. Y., by A. Vernon Hart, one of the best known dealers in that city.

Among the new agencies recently established by the Franklin Company to handle the Franklin air-cooled cars during the coming season are the Fruit-Oil Company, Sharon, O.; E. T. Byram, Galcsburg, Ill.; Colonial Motor Car Company, Springfield, Mo.; Salina Automobile Company, Salina, Kan.; Montana Lumber Company, Lewiston, Mont., and E. R. Nelson, Ishpeming, Mich.

RECENT TRADE REMOVALS.

The Philadelphia G & J Tire agency, of which Sanders Levy is treasurer and F. Berrodin, manager, has moved into new and much larger quarters at 713-715 Broad street. A feature of the new establishment is one of the largest and most completely equipped tire repair shops that the Quaker City can boast of.

During the past week the Philadelphia branch of the Ford Motor Company moved

into its new three-story building at 250-254 North Broad street. The building is practically fireproof and affords no less than 40,070 square feet of floor space, so that the new home of the Ford can hold its own even with the most palatial establishments of the Quaker City's "gasoline row." The first floor is devoted to a salesroom, offices and garage, while the second is given over to a stockroom and the third is occupied by a large repair shop.

PERSONAL TRADE MENTION.

Harry S. Houpt, president of the Harry S. Houpt Company, New York representative of the E. R. Thomas Motor Car Company, of Buffalo, has just returned from a sojourn in Colorado and New Mexico, where he has been spending the winter in recuperating. Mr. Houpt has returned very much benefited in health and will immediately assume personal charge of the Thomas selling end of this territory.

E. Le Roy Pelletier, former publicity man of the Ford Motor Company, is back after a seven-weeks' trip abroad, and after taking a look-in at the Boston show, went west to the scene of his former activities to look after publicity business. It is understood that the former Detroit successively closed negotiations for handling the Maxwell business before going abroad, and upon his return from the West will establish himself in New York City. According to Mr. Pelletier, the New York to Paris race, which has always appeared to Americans in a humorous light, is going to be the cause of much sorrowing on the other side. It was confidently expected to prove the overwhelming superiority of the European cars and bolster the falling market for them in this country. Mr. Pelletier spent three years in Alaska and laughs at the idea of trying to drive a car there.

DEATH OF ROBT. M. PRATT.

Robert M. Pratt, assistant secretary of the Worcester (Mass.) Automobile Club, and widely known throughout Eastern Massachusetts as a newspaper man, died suddenly after a short illness, on Thursday of last week. He was a son of the late Major J. Wheelock Pratt, and was born at Sterling, Mass., forty-six years ago. He is survived by his widow, mother and brother.

NEW TAXICABS FOR NEW YORK.

Under the title of the Knickerbocker Taximeter Cab Company, a corporation has been organized with \$15,000 capital to operate taxicabs in New York City. The directors are William B. Hurlbut and Sanford J. Wise, of the Garford Motor Car Company of New York, and Stewart H. Elliott, of 1183 Broadway, New York. The parent Garford Company is now completing 100 20-30-horsepower special chassis for this service, and they will be fitted up in a manner much superior to the cabs now in use. They will be of the landaulet type and it is expected that this first lot will be placed on the New York streets by April 15. Later the company will extend its operations to Boston, Baltimore and Philadelphia. Further details of its plans and a technical description of the cars to be used will be given later.

Savannah Successfully Scores

By
A. G. Batchelder

SAVANNAH, GA.,
March 21.—"No. 2
has passed Sandfly!" sing
the announcers.

"No. 2 is at the Isle of
Hope!" is the pronuncia-
mento that follows. Then, an interval, and, next, from the bellowing
though musically pitched megaphoners, hurriedly told, is the news that
"No. 2 is turning at Thunderbolt!"

Far up the oil-streaked road there is a blur of red, coming towards
thousands of excited onlookers who know that the first winning of the
Savannah Challenge trophy is to be by a foreign-built automobile, yet
manned by an American crew. 'Tis a pretty sight, in the gorgeous sunlight
of late afternoon, this marvelously space-devouring perfection of moving
mechanism, and the beauty and chivalry of the New South, fascinated, enjoy
the greatest competitive spectacle of this wondrous age to the fullest extent.

Of course, there are hurrahs from the men, parasol and handkerchief
waving from the women, and vociferous strains from the band. Little Strang
is a modest and smut-faced hero, not even deigning to wave as he flashes
past the cheering multitude in the car from Italy. We Americans are not
adepts in acknowledging the salutations of those who would acclaim our
deeds. We accept it all in a matter-of-fact way.

But Savannah, the city, has made good its boast that it could supply an
ideal automobile course, and, furthermore, guard it. All this occurred on
Thursday, March 19, two days after St. Patrick's Day had been properly
celebrated by its many citizens whose ancestry traces to the Emerald Isle.

Yes, Savannah has made good. That is the finding of the automobilists
who to-day are returning northward. Priority and proximity to the metropolis of the country give to Long
Island first claim on the classic Derby of automobilizing, the Vanderbilt Cup race. If conditions—some-
what chaotic at present—make Nassau County, New York State, unavailable, then Chatham County,
Georgia, has the inside track over all bidders, and has it because the Savannah Automobile Club, the city,
and the county demonstrated to the officials of the American Automobile Association entire ability to cope with
every phase of the complicated and exacting situation.

And it was a grand race that the Isotta Fraschini won, persistently pursued by an Apperson, which in turn
had a battle with the Acme, a new candidate for speed and endurance, while in fourth place was the Lozier, at

APPERSON TAKES RUNABOUT CUP
THOMAS SIX-CYLINDER VICTOR

Governor Smith Eulogizes Strang and Marquess.

one stage a leader, and losing the place through circumstances undeniably exasperating, though all in a day's hard running. Fifth finished the Isotta, originally picked as the favorite of the event. Two others—an American and a Stearns—were still going when Referee Webb concluded the 342-mile struggle. An eighth starter had met with disaster, but this Apperson and its crew suffered little beyond a jolt and a scare.

This contention for the Savannah Challenge trophy took place Thursday, in the presence of some thirty thousand people, a third of whom were located on, or in the vicinity of, the capacious grandstand, in the royal box of which sat Hoke Smith, Esq., Governor of the Commonwealth, and the first Chief Executive of a State to recognize the great worth of the automobile by sanctioning the use of military to guard the course for a motor-driven vehicle contest. Mayor Tiedeman, early wideawake to the opportunity of exploiting Savannah, saw to it that the portion of the course lying in the city limits had efficient police protection. Therefore, the great problem of the past in the conduct of automobile races in this country was answered most satisfactorily.

Wednesday had served to some extent as a dress rehearsal for the big race. An Apperson, piloted skilfully by the experienced Lytle, appropriated the Southern runabout cup, its only finishing rival being a Thomas Detroit "Bluebird," J. B. Lorimer driver; the speedy Pennsylvania, with Zengle at the wheel, having suffered a mishap which took it out of the sputtering argument after the fastest round of the 17.1-mile course.

The six-cylinder duel between the Thomas and the Stearns promised much. But it was the fate of the latter to suffer disablement after a couple of laps, thus leaving the other to score unopposed, which it did regularly and faultlessly.

Some of the Hard-working Official Notables.

Starting on the right: Chairmen Thompson and Van Sicklen, Referee Webb; Director Haynes, Secretary Elliott, First Vice-President Speare, Harry Dunn, Starter Wagner, Assistants Reeves and Rutz.

Savannah's leading citizens were responsible for the success accomplished. President Frank C. Battey, of the Savannah Automobile Club, had no more enthusiastic fellow-worker than Mayor George F. Tiedeman. These two were on the job from early until late, though the honor list contained other indefatigables, including Capt. R. J. Davant, chairman City Council; Major W. W. Williamson, president Chamber of Commerce; Wright Hunter, president Cotton Exchange; W. B. Stillwell, president Board of Trade; A. B. Moore, vice-chairman County Commissioners; J. J. Raders, Harvey Granger, George J. Baldwin, Robert M. Hull and Secretary A. W. Solomon. A loud and unqualified word should be said for Major W. B. Stephens, who handled the military arrangements unobtrusively flawlessly.

It was a joint committee of the American Automobile Association's racing and technical boards which stood behind the Southrons and contributed help in various ways. Chairman Jefferson deMont Thompson, of the Racing board, figured as an honorary referee, along with Governor Smith and Mayor Tiedeman. Chairman Van Sicklen, of the Technical board, came to Savannah over a fortnight before the races, and lent aid day in and day out. Vice-Chairman Frank G. Webb, of the Racing board, was the conscientious referee, and Vice-Chairman David Beecroft, of the Technical board, examined the cars to see that stock chassis requirements were observed. Secretary F. H. Elliott, to whom much credit is individually due for the Savannah undertaking; L. R. Speare, first vice-president, and Directors S. L. Haynes, Charles J. Swain and A. G. Batchelder were of the party which came to the races in a special car on the Seaboard Air-Line. H. M. Swetland, A. B. Tucker, L. Eikwort, Jr., and M. C. Reeves were other officers of the meet on the same train. Starter F. J. Wagner and his assistant, W. A. Rutz, came up from Florida. Announcer C. T. Earl was another "regular" who reported, as usual.

When one considers that though Savannah has a population of about 85,000, some 40,000 are colored, one cannot but marvel at the progressiveness of this picturesque place, which contains much to interest the visitor from the North. Peach trees, suffused with pinkish color and redolent of spring; pear-trees, clad in white blossoms and diffusing fragrance, with the yellow jasmine adding to Nature's perfume, prodigious live oaks drooping with Spanish moss; palmettos contributing still more to the tropical effect, all blended into a picture inviting to the stranger. Negroes, shiftless but amusing, completed the atmosphere of the Southland, while Old Sol lent rays which at times became somewhat uncomfortable and supplied burnt faces and peeled noses. But apparently the Northerners hugely enjoyed the visit.

In the preparation of the course nothing was allowed to interfere with making it as safe and secure as possible. Cuts were made across lawns, curves were banked, bridges improved, even built over the road, electric railroads partially suspended operation, and, in fact, everything was made subservient to automobilist's needs. True it is that the hotel accommodations did not come up to the Broadway standard, but two men who were at the Grand Prix of 1906, and sweltered in box-like rooms at Le Mans at \$10 per night, were rather inclined to believe that Savannah did fairly well under the congested circumstances. And even Vanderbilt Cup experiences on Long Island called forth recollections of sleeping on billiard tables or on cots in parlors, temporarily converted into bedrooms—and prices of the get-rich-quick complexion. But Savannah realizes that if it is to become more of a winter resort than it has been in the past, it must provide better than it now has. Something is assured in the near future.

One thing is a certainty, and that is that the members of the Vanderbilt Cup Commission feel decidedly happier than they did a year ago, knowing that if Long Island cannot be the scene of the race, there does exist a city called Savannah, in a county called Chatham, containing therein a course which will be well guarded, well prepared, and most satisfactory for the great automobile race of the year. Governor Smith is progressive, and Adjutant-General Anderson shares opinions that harmonize.

The Story of the Big Race

By John C. Wetmore

Strang and His Italian Winner In Full Cry on the Most Picturesque Stretch of the Entire Course.

SAVANNAH, GA., March 19.—In recognition of the magnitude of the event and its importance to Georgia's great seaport, and by way of demonstrating how rich runs the true sporting blood in the veins of our Southern gentlemen, Governor Hoke Smith had proclaimed a legal holiday in the city. Savannah stood ready to honor the occasion to a man and Savannah's far-famed fair women to grace the occasion by their presence. The State at large also took an eager interest in the event, and excursion trains from all points poured thousands into town.

The early morning hours gave poor promise of a sunny day. There were threatening clouds and chilly winds, which compelled those whose official business compelled an 8 o'clock start for the course to don heavy clothes and prudently provide themselves with overcoats and mackintoshes.

Crowd Was Admirably Controlled by the Militia.

Long before this, however, the militiamen, flagmen and telephone operators in trolleys and automobiles were under way for their stations, and seekers for points of vantage had hurried them in their vehicles, for the course was to be absolutely closed at half past eight o'clock. By 9 o'clock a normal March sun had chased away the clouds and brought joy to the hearts of womankind at the chance to discard wraps for the gay Spring garb that had for weeks been in course of preparation for the great occasion. A half hour later the octette of racing candidates was on hand and drawn up in the order of their start. Far down the long stretch one could see a line of people extending out of sight, all fully 100 feet away from the road, and around the first turn, a quarter of a mile to the east, hundreds massed. At the Isle of Hope and in Thunderbolt, the two settlements on the route, there was a congestion of spectators. Here the efficient militiamen were massed five or ten feet apart. Other soldiers stretched in a thinner line along the open country segments of the circuit. No word of praise can be too high to characterize their discipline and efficiency. The crowd knew they meant business and obeyed. One man sought to cross the track when forbidden and got a bullet in his heel as a souvenir of the military authority that prevailed and that Major Stephen's soldiers intended them to obey orders. When a car stopped for an adjustment or repair, the soldiers kent back the crowd. Even when the Apperson overturned, only enough men to right the car were permitted to approach it.

Sixty flagmen encircled the course, showing the racers "yellow" for danger and "red" for a clear course. They had been re-

hearsed for a week during the daily practice hours. Fifteen telephone stations had been established and manned. "It was a cinch to drive down that aisle of safety," said one of the pilots. "All you had to do was to open her up and let her go."

The grandstand was gay with the A.A.A. banners above and the national colors and flags stretched beneath the boxes. It was set at an angle so every one had an uninterrupted view of the racers rushing down the homestretch. In the vast open field opposite, there were only the press and official stands and three great bulletin boards, on which were painted the scores of the cars by laps, to obstruct the view across the open to the White Bluff road, down which for a mile the racers could be seen in the stirring speed flights and exciting struggles to pass one another. Within that great field were but the megaphone men and the bulletin chalkers.

Savannah's fashionable folk are not early risers, so when 10 o'clock, the hour of the start drew near, the great stand, with its 5,000 seats and 65 boxes, was but half filled, and there were many vacancies in the 50 parking spaces adjoining and extending up the stretch. In fact, it was not until the American, the third car, was sent away, that Governor Hoke Smith and various State and judicial dignitaries drove up in carriages with bared heads in response to the greeting of the standing crowd. Within an hour, though, the stand and parking spaces were filled.

STORY OF THE RACE BY LAPS.

The Start.—Sharp at 10 o'clock Fred J. Wagner, the A. A. A. official starter, began the sending away of the cars at minute and a half intervals in the following order:

- No. 1. APPERSON JACKRABBIT.....Herbert Lytle.
- No. 2. ISOTTA-FRASCHINI.....Louis Strang.
- No. 3. AMERICAN.....F. J. Tone.
- No. 4. LOZIER.....H. Michener.
- No. 5. APPERSON JACKRABBIT.....Wm. McCulla.
- No. 6. ISOTTA-FRASCHINI.....Al Poole.
- No. 7. STEARNS.....Frank W. Leland.
- No. 8. ACME.....M. Neustetter.

Before the start it was announced that the official measurement of the circuit was 17.1 miles, making a 342-mile run of it for the 20 laps. The contending cars were limited to a maximum piston displacement of 575 cubic inches.

When the last car had been sent away and vanished from sight down the White Bluff road there was a craning of necks for the first racer to reach the homestretch. It was Lytle. He flashed by in 18:35. Forty-five seconds later came John H. Tyson's

Lining-up for Start of the Savannah Challenge Trophy Race on Thursday Morning; Weather Perfect, Highway Likewise.

red Isotta with Christie's old mechanic rushing the pace so fast that it had picked up 45 seconds on the flying Jackrabbit by a lap in 17:39, the fastest of the round. The others were content with a more moderate pace, running from 18:41 for Michener to 19:56 for Neustetter. Tire troubles which afflicted Tone sorely throughout the race began early for the American, reducing the time to 27:51. Leland had been forced to stop and brought up the rear of the procession in 30:03.

Second Lap, 34:2 Miles.—Strang was evidently out for a hammer and tongs fight for the lead from the start. Running the round in 17:41, he made up his minute and a half handicap and passed Lytle into the head of the procession and a real lead in the race of nearly two minutes over his nearest pursuer. Leland passed the luckless Tone.

Third Lap, 51:3 Miles.—In the third round word was received that McCulla's Jackrabbit had overturned. It had upset in rounding one of the sharp Isle of Hope turns too recklessly. McCulla was pinned beneath the car. There was a rush of ready helpers, who quickly righted the machine and released its pilot, who escaped with a sprained and bruised back. The car was too badly damaged to continue in the race and was soon declared officially out.

Strang had retained his two-minute lead over his nearest pursuer, but Michener had got by Lytle and so had Poole, so far as the order of the procession went. Neustetter had moved up into fifth place and Tone gotten by Leland. As a matter of fact, the Stearns had thrown a tire and torn through a barbed wire fence. Both he and his mechanic, Nick Brewer, were cut up a bit by the barbs, but pluckily continued after plugging the damaged radiator.

Fourth Lap, 68:4 Miles.—In this round of sprinting Strang increased his lead by half a minute, while Michener hung grimly to his two-minute margin over the other Isotta. The Acme, which was running on a 19-minute schedule under instructions, had crept up into fourth place through Lytle having to stop to mend with tape a broken oil feed leading into the crankcase. Tone was having more trouble with his tires and had been passed by Leland.

Fifth Lap, 85:5 Miles.—Strang pulled away a bit further

from Michener, who hung stubbornly to his two-minute lead over Poole.

Sixth Lap, 102:6 Miles.—The Acme stopped as per schedule to replenish fuel and enabled Lytle to make five minutes of his lost ground.

Seventh Lap, 119:7 Miles.—Poole was forced to stop and change tires and put in new plugs, the porcelain having broken. This gave Michener a lead of seven minutes and allowed the steady plodding Neustetter to creep up within two minutes of him. Lytle had to change spark plugs and lost what he made up on the Acme. Strang was now leading by fully four miles.

Eighth Lap, 136:8 Miles.—The end of this round saw the Lozier, which had been speeding speedily and consistently, in the lead, the only American car to poke its radiator ahead of the Italian. It was but 14 seconds to the good, however, so the struggle was a neck and neck one between the American and Italian cars. When the score was announced there was great excitement over the duel in progress for the lead, the pair being nearly seven minutes ahead of the other Isotta.

Ninth Lap, 153:9 Miles.—Strang started in with vigor to overtake the flying Lozier, which had snatched the lead from him through the Isotta having to stop for a change of tires, to such good purpose that he overtook and passed Michener, leading him by a minute and a half at the end of the lap. Poole, by a circuit in 17:39, had gained considerably on the two leaders. Later it developed that the Lozier had run short on oil and its pistons had seized.

Tenth Lap, 171 Miles.—With the race half over, it looked almost like a runaway for Strang, for he led Poole and Michener respectively by eight and ten minutes. Tyson's Isotta had averaged 54 1-2 miles an hour. Lytle and Neustetter looked hopelessly far behind, and Leland and Tone, though pluckily persevering, were not to be considered in the chances. The Lozier now had its muchly needed oil. At the halfway point seven of the eight starters were running. The best race yet.

Eleventh Lap, 181:1 Miles.—With this lap the fine showing of the Lozier came to an end and its chances of figuring prominently at the finish began to vanish, for its lubrication

troubles put it eight minutes behind Poole's car. Neustetter had increased his lead over Lytle to ten minutes. In fact, it was a bad round for all of the racers but Strang.

Twelfth Lap, 205:2 Miles.—Strang now had the race well in hand, and with his lead of 18 minutes it looked all over but the shouting. A good fight for second place was once more on, the Lozier having bucked up a bit and cut down Poole's lead to two minutes. The six-cylinder Acme was plugging along in fourth place.

Thirteenth Lap, 222:3 Miles.—Poole got the Isotta running again in fine shape and made a desperate effort to cut down his mate's lead by a lap in 17:31. This brought him within four minutes of Strang and 12 minutes ahead of Michener. Once more it looked like one, two for the imported pair, with the Americans far to the bad.

Fourteenth Lap, 239.4 Miles.—Now began Herb Lytle's memorable run to regain lost ground and again place the Apperson among the leaders. From this point to the end of the race the Apperson midget ran every lap but one under 19 minutes. His troubles were over, his tanks refilled, and his tires changed for the final fight for a good place in the race. Neustetter, though, still hung stubbornly to that five minutes lead of his.

Fifteenth Lap, 256:6 Miles.—Lytle covered the next lap in 18:42 and crept up to within three minutes of the Acme. Strang still held to his 13-minute margin over Poole, and Lozier was dropping further back to Acme.

Sixteenth Lap, 273:6 Miles.—The relative positions of the gladiators remained practically unchanged in this round, except that the Lozier crept up a bit nearer to Poole. Neither Leland nor Tone was scored for this round. Leland had run two laps on a bare rim.

Seventeenth Lap, 290:7 Miles.—Calamity overtook Poole in this round and cost him his place among the leaders. There was a stoppage in his gas lead which compelled him to remove his carbureter. It took him 42:40 for the lap, and at the end he had dropped from second to fifth place. Lozier was again in second place, but was 24 1-2 minutes behind the leader. Lytle's

plucky driving had brought him to within a minute of Neustetter, or, to be exact, 46 seconds. Strang was making a run-away of the contest, with a lead of 24 minutes.

Eighteenth Lap, 307:8 Miles.—Now began the struggle between the trio of battlers for place honors which most of all made a great race of the contest and will long live in motor road racing annals. Lytle had passed Neustetter and had crept up so close to Michener that the Lozier pilot only held his runner-up place by a little over a minute margin, with Neustetter less than a minute behind the Jackrabbit steersman. The closeness of the scrap is evidenced by the score: Michener, 366:37; Lytle, 367:42; Neustetter, 368:10. When the complete figures appeared on the bulletin boards the spectators woke up to the situation, and from that point on eagerly strained their eyes up the stretch for the coming of the cars and wildly cheered each one as it shot by.

Nineteenth Lap, 324:9 Miles.—Lytle was the first to be sighted. He had opened the gap separating him from his pursuers to exactly four minutes. Neustetter was now his pursuer, having passed Michener into a lead of over three minutes. Poole in this round made one last despairing run, and in so doing scored the fastest lap of the race for the Isotta, 16:46. He was hopelessly out of it, however, for one-two-three honors.

Twentieth Lap, 342 Miles.—Only an accident could have deprived Strang of the race. In fact, he had completed the nineteenth round before his pursuers had reached the eighteenth post. He had an ovation as he crossed the tape, a winner in 381 min. 30 sec., or 6 hrs. 21 min. 30 sec.

Great Enthusiasm Marked the Finish.

Interest in the race was now in the struggle for second place. Lytle met with a wildly enthusiastic reception as he flashed by in 404 min. 37 sec. Hardly less enthusiastic was the greeting accorded Neustetter, who was third in 409:05, and Michener, who finished fourth, in 409:17. Poole captured fifth place in 418 minutes flat. Tone and Lozier were last scored at the close of the 15 laps, or, 256.5 miles, the American in 366:30 and the Stearns in 405:24. The Savannahians were heart-

broken over the bad luck of their sole representative, which Ross Guerard had entered.

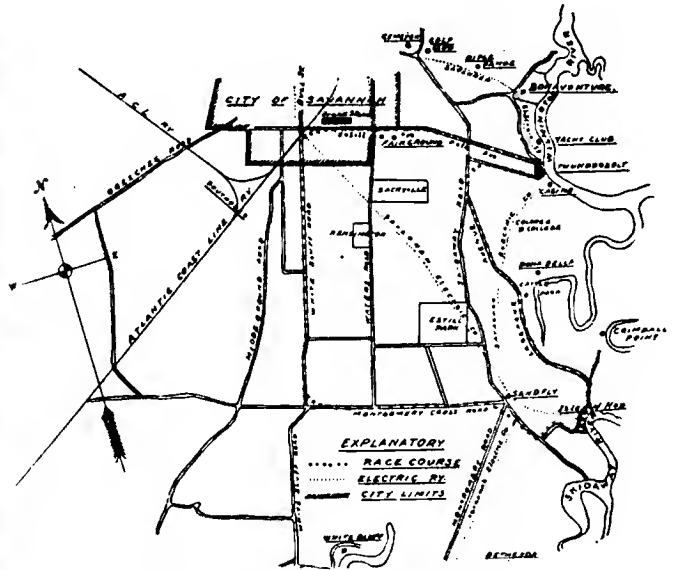

It had been the grandest and closest struggle in the history of long-distance automobile racing in this country. Seven out of eight starters were fighting the fight when the race closed, a record of survivorship never even approached in any previous motor road race on either continent.

The winning Isotta, which was equipped with Michelin tires, did not even have to make a replacement during the race and kept its motor running without a stop from start to finish. Its only mishap was the breaking of the starting crank through the strap being too tight.

The Apperson's motor never once stopped running. An oil lead to the crankcase broke, necessitating wrapping with tape.

The Acme ran on a 19-minute schedule. It was stopped in the sixth and ninth laps for fuel and in the eighth for new tires. It was the only six-cylinder car in the race.

The Lozier's troubles had mainly to do with tires, but difficulty was also had with the exhaust, which broke and dragged until camp was reached. It was too hot to be removed by hand. It also had another vital trouble. The car was the same one used in 24-hour races last year and was fitted with two five-gallon oil tanks. Since the stock car only has one tank, the

Map of the Race Course at Savannah.

technical officials ruled that it could start with 2 1-2 gallons in each tank. It was figured that the car would go half the distance with this amount, but the estimate fell short, the supply ran out miles away from the camp, the pistons seized, and the engine received a bad wrench.

At the conclusion of the race the victorious Louis Strang and his mechanic, John Marquese, were brought before the stand and introduced to Governor Smith, who, in an eloquent speech, presented them to the Savannahians.

ST. LOUIS INTENDS TO BID FOR VANDERBILT.

St. Louis, Mo., March 23.—Despite all the advertising Savannah got because of its tremendous success in running off the three stock car races last week, St. Louis, through the St. Louis Automobile Manufacturers' and Dealers' Association and the Automobile Club of St. Louis, is determined to make a strong bid for the next Vanderbilt Cup race. Scouting expeditions have been out of late looking for a suitable course, and think they have a good one in sight. It is approximately 32 miles in length, starting on the Clayton road at the North and South road, and running to Henry avenue, through the village of Manchester, thence back over Manchester road to the North and South road, and then to the starting point.

Some Mechanical Facts of the Racers

By David Beecroft

First Off on the First Day Was Apperson No. 1, with Lytle at the Wheel.

SAVANNAH, GA., March 21.—Of the thirteen cars that participated in the different events of the Savannah carnival, not one but conformed in all details with stock construction. All of them were not the chassis of touring cars—far from it. Rather, the autoist of to-day is accustomed to seeing almost any kind of chassis and body lines for a roadster car. A few critics in the grand stand suggested that “such and such” was not a stock model, but that was disproved when the interpretation of the rules, which called for the manufacture of five similar cars of that type previous to February 1, 1908, was considered. In the 342-mile event for cars with a piston displacement less than 575 cubic inches, the two Isotta-Fraschinis looked very much like special racing cars with their big gasoline and oil tanks and racy lines, but it was demonstrated to the satisfaction of all that these cars had been manufactured in considerable numbers during the past year, and, like the Renault and one or two other foreign concerns that build racing runabouts, are in reality stock models, as much as the less racy roadster cars turned out by some of the American makers.

It is questionable if the stock phase of the two Apperson Jackrabbits in this same race would not have been questioned if the race enthusiasts had not been aware of the fact that they had been regularly on the market for more than a year. Some question was raised as to the Lozier's eligibility, but Mr. Mead, the company's representative, certified that seven of these cars have been built. In case of the three remaining cars in this event, namely, the American roadster, the six-cylinder Acme, and the four-cylinder Stearns, no question as to their right to contest was raised, their lines being that of standard touring car or roadster.

Characteristics of the Most Successful Competitors.

The winning Isotta reached Savannah two days before its race, having been rushed out of customs at New York to take the place of Harding's Isotta that was wrecked. Up to the time it reached Savannah its motor had not been turned over since leaving Italy, and Strang had not driven this make of car before that time. The car in the race showed, however, the careful working out it must have received before leaving the factory. The Isotta is a high-speed engine, of the four-cylinder type, having cylinders cast in pairs with opposite valves. When traveling on the course its motor turns over at 1,800 revolutions per minute, which speed is made possible by the use of exceedingly large flat-seated valves measuring 3 1-2 inches in diameter. Also assisting in this high-speed work are the extremely light pistons, rendered so by perforating them beneath the rings and using a hollow connecting rod. The cylinders have a bore of 145 mm. and a stroke of 120, equivalent to 5 4-5 and 4 1-2 inches, respectively. Instead of using the double ignition outfit employed on all of the other racers, but a single high-tension Eisemann magneto outfit with one set of plugs, is used, the plugs being carried horizontally in the intake valve chambers. In the clutch are 51 discs—25 steel and 26 bronze. These cars on the course consumed a little more oil than the others, requiring all told 24 gallons each for the twenty laps, or close to a gallon and a half a lap. The car is supplied with two sets of brakes, cast-iron shoes, operating against steel drums. The regular brakes on the

jackshaft are 9-inch drums with 3-inch bands, whereas the rear wheel emergency brakes are 11 1-2-inch drums with 2-inch friction shoes. The car has a particularly large exhaust pipe, with a cut-out opposite the center of the chassis. It was shod with Michelins.

Lytle's Apperson which finished second, differs radically from the Isotta's in that it uses separately-cast cylinders with opposite valves, and has a bore of 5 1-2 inches and a stroke of 5 inches. While the Apperson cars do not use such large valves as the Isotta, they have always been known to be among the largest made use of in this country and also to be of the flat-seated type. The ignition employed was a double system, Bosch magneto and battery, with two sets of plugs, that for the magneto over the intake valves and the battery set over the exhaust valves. These cars have a wheelbase of 105 1-2 inches, which is 1 foot shorter than that used on the Isotta's, and which assisted them not a little in making the turns. Diamond tires were used.

Showing of the Only Six-cylinder in Challenge Event.

By finishing third, the six-cylinder Acme established itself as a prime favorite, because of its consistent running, the majority of the spectators knowing that it was going according to a pre-arranged schedule. It had the distinction of being the only six-cylinder car in the race, and the regularity of its work was a satisfaction to many. Its motor has six separately cast cylinders, of 4 1-2-inch bore and 5-inch stroke, and intake and exhaust valves placed on opposite sides. Its ignition system combined Eisemann high-tension magneto and a storage battery outfit, with two sets of spark plugs, one set over the intake valves, the other over the exhaust. The lubrication system is confined to a 3-quart mechanical oiler on the dash, from which pass three leads to the crankcase compartments. Its gasoline capacity is 23 gallons.

The 60-horsepower Lozier is a 1907 car, and one that has been seen on the track in 24-hour races. Its external appearance is characterized by a very large cylindrical gasoline tank, carried transversely behind the seat, two 5-gallon cylinder-shaped oil tanks, carried from the frame at the sides, and its white finish. The car has four 5 1-2 by 6-inch cylinders, cast in pairs with opposite valves—typical Lozier construction. It uses a double system of ignition, in which are used Simms-Bosch magneto, and a Witherbee storage cell, with two sets of plugs over the valves. Its oiling system is quite complete, in that three leads connect with the crankshaft bearings and two with the crankcase. The right side oil tank carries a supply which is forced into the oiler by pressure, and the left-side tank is provided with a pump for injecting oil directly into the crankcase.

Facts About the Other Cars Participating.

Of the remaining two cars, the Stearns and the American, it might be added that the Stearns is a 1908 four-cylinder car, the same as described last week in THE AUTOMOBILE. The American car, while of the same design as the American roadster, familiarized to the public during the last year, has a larger motor, it being rated at 50-horsepower, and having four cylinders with 5 1-4-inch bore and 5 1-2 stroke. These cylinders are in pairs with valves on the right, and take double sets of spark plugs for the magneto and storage battery ignition system. The lubrication of the engine is cared for by a 6-pint oiler on the dash,

This Railroad Track Was Not Used During the Race.

with a 2-gallon auxiliary tank, carried on the chassis. From lubricator are leads to cylinders, engine bearings, and crankcase.

The Six-cylinder Candidates for the Southern Cup.

The two cars that contested in the six-cylinder Southern cup race on the first day were both 1908 six-cylinder machines—the Thomas carrying all the earmarks of the four-cylinder Thomas, and the Stearns having a similar relation to its four-cylinder brother. The winning Thomas has its six 5 1-2 by 5 1-2-inch cylinders cast separately and provided with opposite valves. Its ignition doublet is a Bosch magneto and Atwater-Kent unit, taking its supply from dry cells. The car uses the three-disc clutch common to Thomas machines and drew its gasoline from the standard tank beneath the driver's seat, although it carried a large barrel-shaped gasoline tank in the rear, which during the race was filled with water and aided the car considerably in holding the course. Diamond tires were used. The Stearns six was one of the first the company turned out, and while its cylinders are the same castings as used on fours, yet its motor design is of the 1907 Stearns and not the 1908, as was the case with the four-cylinder car. The other chassis lines were very similar to those employed in the four.

Lozier Passing Grandstand, Leading and Looking All Over a Winner.

Those Entered in Runabout Class.

The three cars which competed in the small runabout class, with piston displacement under 375 cubic inches, show widely different methods of construction. Lytle's winning Apperson has 4 3-4 by 5-inch cylinders which are separate castings with opposite valves, the same as employed in the regular Apperson lines. Used on it is a double ignition, with Bosch magneto and storage battery, delivering current respectively to plugs over the intake and exhaust valves. Employed also is the standard band clutch and the three-speed selective gearset. Like the other two competitors in this event, the Thomas-Detroit and the Pennsylvania, it is a shaft-driven machine.

The Thomas-Detroit, which finished second, uses 4 3-4 by 5 1-4-inch cylinders, which are cast in pairs and have both sets of valves on the right side. Employed on them is a Bosch magneto. The Pennsylvania, which met with an accident in

the second lap, is the only car in the three races to use a motor

Soldiers Were Useful and Not Ornamental.

with valves in the cylinder head, as well as transmission incorporated with the rear axle. The four motor cylinders are 4 3-4 and 5 1-4 bore and stroke respectively, which permitted it to get just within the 375 cubic inch limit.

Difficulties Met and Overcome.

In recounting the story of the race, it must be borne in mind that the two Isotta cars were reckoned as big factors in it. From what has transpired since the race, it is apparent that Strang went out "to beat" it right from the starting signal, whereas Poole took a safe pace for the first half, and then, perhaps, was ready to strike whatever pace the exigencies called for. Out of the twenty laps, Strang held first place in every one but the eighth, when the Lozier crowded him out by 14 seconds, which lead was to be lost in the ninth, when Strang was leading by 1 minute and 32 seconds. But his position was unsafe during the earlier part of the race.

Everybody had staked pretty liberally on the white Lozier to hold the Isottas,

and the work of it in the first eight laps showed how well such ground was taken. In every one of the first eight circuits, Michener did the work in 18 minutes and a few seconds—a phenomenal record for consistent running. But Lozier's chances ended with the ninth lap. The tenth and eleventh laps were bad, requiring 26:31 and 27:12 minutes, respectively, to go the course. It was apparently at this time that the exhaust pipe connecting with the muffler worked loose, and added to this was the work of refilling with gasoline and oil. For four laps Michener picked up his old pace, but dropped back in the seventeenth, eighteenth, and nineteenth. The last lap was made in 18:57, the car showing its earlier speed when free from the muffler and tire troubles. But while it dropped back into the fourth place, the Lozier was one of the interesting factors in the race. Even when the Lozier's chances against the Strang-Isotta combine were poor, it was an active factor in the

Tires Will Burst, but Nowadays Are Quickly Replaced If of the Demountable Kind.

Only Photographers and Officials Allowed Inside.

game, and not until it crossed the finishing line did the spectators know the exact position it held in the field.

When the Lozier dropped from second to third place in the tenth lap, and Al. Poole, with his Isotta, took second place to Strang in the other Isotta, the horizon looked a little gloomy for American machines. Everybody thought that the earlier prediction of "Poole letting loose in the second half" had come true. So it had, but not for long, for he, too, was doomed to disappointment. Spark plugs went back on him, the green porcelain cracked with the intense heat, and, added to this, was the trouble of the compression relief cocks in his cylinder heads working open. Once they opened in the homestretch, necessitating a stop at the east end of the grandstand. Laps seventeen and eighteen clouded all his hopes, and were the turning points of the race in the deciding of what cars would get second, third, and fourth places. Going down the backstretch, his carbureter went back on him. It was necessary to take off the carbureter and clean out the

Apperson-Poole-Acme

gasoline line, which brought the time of the lap up to 42:40, the longest of the day, except for a couple made by Leland when he went the circuit on three tires and had other troubles. This lap took the sights of victory out of Poole's firmament, for, while he worked on the roadside, Apperson, Lozier, and Acme had been flying past; Apperson and Acme climbing up into second and third places with each lap, while Lozier was losing a little, but making certain its position ahead of Poole.

The three-cornered fight between Lytle-Apperson, Michener-Lozier, and Neustetter-Acme was interesting, and a big feature in the second half of the race. It will always prove an interesting chapter in the history of road racing how stubbornly Lytle fought from that fifth position to second. During the "dark ages" of his race, laps four to sixteen, inclusive, he had his little troubles. A copper oil pipe to the crankcase broke and had to be taped; then the hand oil pump for injecting oil into the crankcase broke and matters looked dark; added to these discomforts was the small lubricator that the car carried on its dash, and which is fed from a rear oil tank by pressure. Mechanician Davis pumped oil all the time, and then the motor could not get enough. However, the "long lane" had a turning.

STUDEBAKER AND PULLMAN REACH SAVANNAH

SAVANNAH, GA., March 19.—Mud-bespattered and loaded with equipment consisting of shovels, picks, tackle and the like, all of which showed signs of hard usage, the 30-horsepower Studebaker, driven by Frank Yerger and his brother, Robert, and accompanied by William J. Boyd, as observer, reached here at 4:30 Wednesday afternoon. After officially checking in to President Battey, of the Savannah Automobile Club, the party went to the race course, where they were congratulated by members of the A. A. A. and local enthusiasts, receiving an ovation from the crowd at the stand. The Studebaker also carried dispatches from Commandant R. A. Pendleton, of the League Island Navy Yard, Philadelphia, to Commandant E. D. Taussig, of the Portsmouth Navy Yard, which were delivered en route. The Studebaker's time for the trip was 14 days 8 hours, which represents an excellent performance when the condition of the greater part of the 1,100-mile trip is considered.

The Pullman 40-horsepower roadster, driven by P. T. Gillette and Bob Morton, and carrying A. Daley as observer, did not check in at the De Soto Hotel until 1:35 P. M. Thursday, having required 15 days 5 hours 5 minutes to complete the 1,100-mile journey. After stopping at the De Soto, they drove to the City Hall to deliver a message from Mayor Reyburn, of Philadelphia, to Mayor Tiedeman. Then they visited the scene of the big race, and received applause galore.

The run to Gettysburg and to Washington was made in good time by both cars, and without incident, the drivers not encountering serious work until Centerville, Va., was reached. Both cars were mired several times, and it was a continual struggle through sticky, plastic clay through most of the States. At Fredericksburg, Md., the Pullman was 12 hours ahead, but

by the time Richmond was reached the Studebaker had cut this down to an hour.

From Richmond to Suffolk the cars kept together, reaching the latter place at the same time and leaving in company with Portsmouth as their objective point. The Pullman reached there an hour and a half before its opponent, and as the Studebaker had to wait for repairs, increased its lead, until at Broadnax it smashed the right forward wheel. After stopping for the night at Broadnax, the Pullman went ahead, and never saw the Studebaker again, although the latter reached Savannah first.

The rules of the race, which was run under the auspices of the Quaker City Motor Club of Philadelphia, prohibited the relaying of drivers or departing from the course laid out, and it is understood that the Pullman entrants will prepare a formal protest against the Studebaker on the ground of having violated these rules. This will be presented to the contest committee of the Quaker City Motor Club for action later. The crew of the Studebaker also accuse their competitors of having infringed the rules, and will likewise file a protest.

Some idea of the difficulties of the route may be gained from the fact that on one stretch it took the Pullman 67 hours to struggle through sticky, plastic clay through most of the State. go 77 miles, and 70 gallons of gasoline were consumed. On frequent occasions, both cars had to enlist the services of horses and mules to extricate them from mudholes which threatened to engulf them entirely, two miles an hour often being considered excellent progress. The worst roads were encountered in Virginia and North Carolina, where a heavy clay soil predominates, the roads getting better as the teams progressed. It soon developed into a day and night race, the crews getting little sleep.

President Battey Greets Studebaker Tourists.

Mayor Tiedeman Welcomes the Pullmanites.

Lytle and the Apperson Southern Runabout Cup Winner.

SAVANNAH, GA., March 19.—Hospitality was unbounded, eloquence ran rampant, and jollity was unconfined at the shore dinner tendered the visiting autoists to-night by the Savannah Automobile Club. It took the form of a Southern shore dinner at the Thunderbolt Casino, to which the guests were carried in autos. The titulation of Northern palates by crab soup and hot Georgia biscuits will ever remain a pleasant memory with the visitors.

His Excellency, Governor Hoke Smith, was there to present the prizes, and prominent State, county, and city officials were also guests. All the talk was of the race, the course, the management, and the chances of the Vanderbilt Cup race coming to Savannah next autumn. Good roads also came in for eloquent exploitation.

Frank C. Battey, the president of the club, presided, welcomed the guests most happily, and then introduced the Governor. His Excellency expressed his thanks to the visitors and also to the Savannahans for what they had done to make the meet a success, declaring it had been of value as well as a pleasure to the whole State. He was most impressed he said by the co-operation of all the citizens in promoting the affair, and the pronounced success which had attended the promoters' efforts.

Messrs. Hamilton, Apperson, and Kiser were then asked to rise and receive the trophies won. Next Strang, Lytle, and Salzman were summoned to receive special bronze medals from the City of Savannah.

Oratory galore followed. Chairman Thompson congratulated the Savannahans on their success. He had seen races in Eng-

land, Ireland, France, Germany, and Italy, and in this country, but none had been better conducted than this one. It took but several hundred Georgia soldiers and a corps of city police to guard the course as effectively as had 7,000 troops the Grand Prix route. The chairman told his hearers confidentially that next to his own State he would vote for Savannah. He said military protection for automobile races cannot be had in New York State because of politics. "Down here you seem to have politics only one way—the good people get what they want," he said. He said that the only trouble he heard of for the whole day was one man who got shot in his toe, "and I suppose he stuck it over the line."

A. G. Batchelder, editor of THE AUTOMOBILE, enlarged upon the value of good roads to Georgia and referred to the excellent beginning in Chatham county. Frank Oliver, counsel to the club, in

the matter of securing the course, said that this race would foster the movement for good roads in Georgia. He stated that the county commissioner had told him he would furnish twenty-five to thirty miles for the course if needed.

Gen. Clifford S. Anderson, of Atlanta, a member of the Good Roads Association, declared it was his aim to have Savannah, Augusta, Atlanta, Macon, and the other cities of the State, connected by a great highway.

Edgar Apperson declared that the industry needed such stock car races, which most helped makers to improve the kind of cars that people want to buy. John C. Wetmore, the dean of the automobile pressmen, made the humorous speech of the evening, his witty remarks creating a whirlwind of laughter and applause. He told the Georgians that their race was the greatest and most closely contested one ever held in the world.

Secretary F. H. Elliott, of the A. A. A., urged the Savannahans to join with the Atlanta and Macon clubs in the formation of a State association and to use their influence with their congressional representatives in the Judiciary Committee in behalf of the Federal registration bill.

N. H. Van Sicklen, chairman of the A. A. A. technical board, confessed to lack of speech-making ability, but said that he was glad to have been of some aid in helping to make the race successful. H. M. Swetland, president of the Class Journal Company, complimented Savannah and told of the early days of automobiling and related experiences with his first car. J. F. Kiser, whose Thomas won the cup for six-cylinder cars, promised to enter all the races the Savannahians should promote.

Thomas-Detroit, Second in Runabout Cup Event.

Pennsylvania Which Made Fastest Lap Runabout Event.

Resolutions were adopted thanking all who had been instrumental in making a success of the races, the list being a long one. It was nearly midnight when the party scurried back to town in the moonlight. J. D. Rosenheim was the chairman of the committee having the most enjoyable function in charge.

SOME SAVANNAH GOSSIP.

Savannah Club's President on A. A. A. Racing Board.—Chairman Thompson has appointed President F. C. Battey, of the Savannah Automobile Club, as a member of the A. A. A. Racing Board. The appointment was deserved, in view of the Savannah outcome, and Mr. Battey is certain to prove a most valuable member.

THE CLUB OF LEXINGTON, KNOWN AS THE BIRD CLUB, has been organized.

Salzman and Thomas Six-cylinder Winner Rounding Isle of Hope Curve.

NEW JERSEYTES MUST GIRD ON TIGHTENING LEGISLATION.

NEWARK, N. J., March 24.—The automobilists of New Jersey definitely come to the conclusion that the only way they obtain sane automobile legislation is through most thorough organization over the entire State.

indications point to the probability of the election of W. C. Kirby, of the New Jersey Automobile and Motor Club, as president of the Associated Automobile Clubs of New Jersey, the meeting of which will take place March 31, at Trenton.

A recent letter from Senator Frelinghuysen to Mr. Crosby conveys the information that a recent conference of New Jersey automobilists was held at Atlantic City. **McCulla Tells of His Accident.**—Asked about his mishap, William R. McCulla, driver of the Apperson No. 5, said: "I misjudged the speed of my car while attempting to pass the Isotta, and tried to take a sharp left-hand turn too fast. As a result, my car turned over. Absolutely nothing was wrong with the car, and the accident was due entirely to an error in judgment. The only damage done to the car was the breaking of the steering wheel. A temporary repair was made, and the car was driven to the garage under its own power."

Trials of the First Six-Cylinder Stearns.—One of the two starters for the six-cylinder event, Wednesday, was E. H. Inman's Stearns, driven by Leland. It was the first of its kind turned out by the Stearns factory, and was equipped with the regular touring gear. Special sprockets had been expressed from Cleveland, but had not been received, so that Leland had to speed his engine up to more than 1,750 r. p. m. This is a terrific speed for an engine the size of the Stearns, and, as it was maintained for some time, the oil in the crankcase became

exhausted, and two of the big end bearings "froze," breaking the connecting rods. In the long-distance race, Leland drove Mr. Guerard's Stearns, but was continually harassed by tire troubles. The car was equipped with the ordinary clinchers and common rims, and at one time Leland ran the Stearns round the circuit two complete laps with but three tires on, which made high speed impossible, the race being declared off before the Stearns covered the total distance. Leland was the only Stearns' representative on the ground. Leland, Oldfield, and Vaughan will be the three Stearns' drivers in the Briarcliff race. Vaughan has recovered from his recent injuries, and is now at the Cleveland factory tuning up his car. Oldfield will be on the course next week. Mr. Stearns says of racing: "Of course, racing is a good deal like fishing—some days you catch fish, and some days you don't."

How Tucker Sized It Up.—A. B. Tucker was the publicity man for the Savannah races, and in one of his press sheets, just issued, he comments in this vein: "The races of the past week at Savannah showed a great light for the veterans of the North. When the contingent of American Automobile Association officials, racing experts, and newspaper men arrived at Savannah they experienced a manifest jolt. Much had been written regarding the two days' carnival of speed slated for March 18 and 19, but all that had been published failed to clearly convey the fact that the automobilists of this Southern city, unused to racing matters, and simply following the one rule of 'Thorough,' had made arrangements which could only be described by one word—perfect. The course was the best ever selected in America."

Stearns Six-cylinder Candidate.

GEORGIA HAS AN UP-TO-DATE GOVERNOR.

It is more than likely that the Governor of Georgia, the Hon. Hoke Smith, is, first of all, something of a politician. Otherwise—in the South, where politicians are born in plenty—he would not be the chief executive of that commonwealth.

But automobilists, one and all, without regard to party affiliations, at the present moment would vote for this particular Smith, no matter what office he might seek in the worthy pursuit of saving State or country.

First of all American governors, the Hon. Hoke attended an automobile road race, unashamed of being seen in the company of automobilists, unafraid of the farmer vote—that bugaboo of the apprehensive applicant for ballots—and even adding to the enormity of his crime by issuing an order permitting the use of the State militia in the guarding of the course.

True the thousands enjoyed the greatest spectacle of modern times, true that no one was injured by the motor-driven juggernauts (?), true that the attention of the whole country has been called to the fact that Georgia has roads good enough for the driving of automobiles over them at the highest rate of speed, and, finally, true that the enterprising city of Savannah has had its business progressiveness and charms widely advertised.

But the stickler for the letter and not the spirit of the law will say that Governor and Mayor exceeded the powers entrusted to them by the people. Hair-splitters of any sort are tiresome; they impede and delay advance;

only strong men interpret laws according to the needs of the hour, assuming implied authority and accepting the responsibility therefor. The roads were built for the use of all the people—including automobilists—and Governor Smith recognized that the commissioners of a county and the aldermen of a city were competent to decide if the temporary employing of the highways for the exploitation and betterment of a new type of vehicle intended for general usage did not unduly interfere with the rights of those who utilized the avenue of commerce and pleasure previous to its appearance on the roads.

Here's to the Governor of Georgia, the Mayor and the councilmen of Savannah, and the road commissioners of Chatham county! Though they shall have many imitators, their names are indelibly inscribed on the roll.

THE PREDICAMENT OF THE OLDEST CLUB

To insure the success of the Good Roads Association, enlarged upon the value of good roads to Georgia and referred to the excellent beginning in Chatham county. Frank Oliver, counsel to the club, in the matter of securing the course, said that this race would foster the movement for good roads in Georgia. He stated that the county commissioner had told him he would furnish twenty-five to thirty miles for the course if needed.

Gen. Clifford S. Anderson, of Atlanta, a member of the Good Roads Association, declared it was his aim to have Savannah, Augusta, Atlanta, Macon, and the other cities of the State, connected by a great highway.

Edgar Apperson declared that the industry needed such stock cars, which most helped makers to improve the kind of caused the directors of the New York State Automobile Association to accept temporarily a constitutional change which reduced the A. C. A. dues to \$500. But when it was recently made apparent that the dominant figure of the club's exclusive ring was interfering with the State association's legislative program and peremptorily disregarding the acquiescence of the club's duly authorized delegate in the premises, the limits of consideration and toleration had been passed.

Surely the oldest club of the country is in sore straits under its Shattuckian—almost Pickwickian—government, and if a change is not effected the handwriting on the wall of the unfrequented, expensive home will soon be legible even to its short-sighted governors.

EVOLUTION OF CRANKCASE DESIGN.

Within the past two years it has become noticeable that designers are no longer of one accord concerning that essential of motor design—the crankcase. Evidences seemed to point to the practically universal adoption of the two-piece crankcase of aluminum, and the use of this type is probably more general than that of any other that could be mentioned. There has been more or less talk of abandoning aluminum for this purpose, but thus far it has had no result. Departures have been along other lines. One of these is the adoption of the one-piece crankcase with provision for the insertion of the crankshaft and camshafts, the latter complete with their bearings, from the ends, thus not alone simplifying the motor itself but also facilitating its dismounting and re-assembling. Liberal handholes are provided for main-bearing adjustments, and access to the crankcase.

A.A.A. WILL SOON CONTAIN 30 STATE BODIES AND 200 CLUBS.

An unmistakable indication of the belief in benefits to be derived from organization by automobilists is supplied in a recent announcement from the secretary of the American Automobile Association, and is most interesting.

New York.—The Empire State now leads in the number of automobile clubs, and during the past week the Peekskill Automobile and the Automobile Club of Ulster County, Kingston, were added to membership in the New York State Automobile Association, giving that organization a numerical strength of 43 automobile clubs. The Automobile Club of Mount Vernon was formally organized on Thursday last. The automobilists of Yonkers will form a club in the near future, and automobilists of many other cities in New York State have similar plans in view.

Ohio.—Automobile Club of Toledo formed, and the Automobile Club of Portsmouth is under formation.

Kentucky.—The Automobile Club of Owensboro and another automobile club of Lexington, known as the Blue Grass Automobile Club, have been organized.

Arkansas.—The Automobile Club of Little Rock is the first club of that State to organize, and is co-operating with the automobilists of Pine Bluff and Fort Smith, who are organizing clubs with the view of forming a State association.

Pennsylvania.—The Norristown Automobile Club and the Motor Club of Harrisburg have applied for membership in the Pennsylvania Motor Federation.

Nebraska.—Omaha Automobile Club.

Michigan.—The Flint Automobile Club and the Automobile Club of Kalamazoo have completed organization, and clubs are also being formed in Jackson and Battle Creek.

Maine.—The automobilists of Portland and Bar Harbor are expecting to complete the organization of local clubs in their cities within a fortnight.

In many other Southern and Western States similar organization work is being conducted, and it is confidently expected that before the touring season begins there will be affiliated with the American Automobile Association thirty State associations, comprising at least 200 automobile clubs.

NEW JERSEYITES MUST GIRD ON THEIR ARMOR.

NEWARK, N. J., March 24.—The automobilists of New Jersey have definitely come to the conclusion that the only way they can obtain sane automobile legislation is through most thorough organization over the entire State.

Indications point to the probability of the election of W. C. Crosby, of the New Jersey Automobile and Motor Club, as president of the Associated Automobile Clubs of New Jersey, the meeting of which will take place March 31, at Trenton.

A recent letter from Senator Frelinghuysen to Mr. Crosby conveys the information that a recent conference of New Jersey automobilists decided that the license fee should be raised to \$2 for cars under 10 horsepower; \$5 for cars from 10 to 30 horsepower, \$10 for any above that figure; drivers' fees to be raised to \$4; no tourists' privileges; manufacturers' fee to be \$5 annually for from one to five cars.

Mr. Crosby comments in this strain:

It will be seen that the automobilists of this State are to get nothing in the form of tourists' privilege, or any change in the present limitation of speed, and will have to pay increased license fees, as well as doubled drivers' license fees; or, to drive a car anything over 30 horsepower will cost \$14 per annum. The cars will, if what is proposed becomes law, have to pay an annual license fee of \$5 per car, limited to five cars. The automobilists of this State must, therefore, acquiesce or fight."

ANOTHER CLUB FOR N. Y. STATE ASSOCIATION.

MT. VERNON, N. Y., March 23.—The Automobile Club of Mt. Vernon is the latest addition to the membership of the New York State Automobile Association of the A. A. A., the organization of the new club having been perfected on Thursday last at a rousing meeting. The officers are: President, William Adams; vice-president, F. A. Merriam; treasurer, Robert M. Van Namee; secretary, F. A. Kately; governors: R. V. Briesen, Wm. McGonigal, W. G. Phillip, J. E. Briggs and A. Schlesinger.

PROBABILITY OF ANOTHER NEW YORK CLUB.

It is among the assured probabilities that there will be another automobile club in New York City for the borough of Manhattan, the general sentiment of automobilists being that a club is needed in Manhattan belonging to the New York State Automobile Association of the A. A. A. The best results in legislative and other matters are assured through local clubs organized into State bodies. As one automobilist put it: "Just as long as the Automobile Club of America is controlled by a self-perpetuating board of governors trying to make the club national in character, which it is not and cannot be under the existing circumstances, there is positive need for a club in Manhattan Borough to supplement the efforts of the Long Island Automobile Club in Brooklyn, the Richmond County Automobile Club on Staten Island, and the Bronxville Automobile Club in Bronx Borough."

ONE AUTOIST'S INTERFERENCE IN NEW YORK LEGISLATION.

ALBANY, N. Y., March 24.—That new and revised Motor

Vehicle law is not yet introduced, and will not be till the end of the week. It would have been introduced and printed a week ago had not the draft of the bill presented by the New York State Automobile Association been objected to by A. R. Tuttle, without the sanction of the Automobile Club of America, although the legislators thought he was then representing that New York City club. The suggestions he made of an increased registration fee were sufficient to hold the bill and call for several conferences; then the Good Roads and Highway Commission bill came along and occupied the attention of Senator Allds, and the bill has not been touched.

The bill will be amended before introduction to strike the original provisions for penalties for violations by owners and drivers and a simpler penalty provision submitted. The fees for registration, based on weight, will probably remain as they were, or

nearly so, and produce \$300,000 revenue for New York State. The speed limit of the present law will be taken out, and the general common law that no one shall so drive or ride on the public highways as to endanger the life or property of others using the highways will take its place.

It is understood here that the reason for the suggestion to the legislators that automobilists would be willing to pay a registration fee to the State of from \$4 per hundred pounds and up to \$40 a year on their cars is due to the fact that some New York City automobilists, whose residences are in New Jersey, Massachusetts, or Connecticut, but whose autos are assessed as personal property in New York, pay about \$200 to \$235 as a personal property tax on them. Hence, as the proposed registration fee is in lieu of a personal property or other taxation, to pay \$40 to the State instead of \$235 is personally economical to those seemingly most interested in this proposition.

Through the Sage Brush of the Utah Plains.

THOMAS COMPLETES TRANSCONTINENTAL.

SAN FRANCISCO, March 24.—Amid scenes of the wildest excitement ever witnessed in connection with an automobile event, the Thomas car made a triumphal entry into this city at 4:30 this afternoon, its total elapsed time in crossing the continent being 41 days 8 hours and 15 minutes, which compares very favorably with the one-man record made under the best weather conditions, despite the fact that the Thomas made a detour of 900 miles to the south, bringing the total distance covered to 3,832 miles. Seldom have contestants in any sporting event been accorded a more enthusiastic reception than was the portion of Harold Brinker, George Schuester and the rest of the Thomas crew. San Franciscans have been awaiting the arrival of the car for several days past, and large crowds waited until a late hour last night. They were out again the first thing this morning, so that when the car finally struck Market street its progress was arrested by the hundreds who wished to personally congratulate Brinker and his comrades, and the police were practically helpless.

The last stage of the continental trip consisted of the 100-mile run from Los Baños here, and it was one of the best stretches in the entire trip since leaving New York. The boulevards in Alameda county were in fine condition, and part of the distance was covered at the rate of 40 miles an hour. There was a large procession of cars for the entire 50 miles from San José. On a smaller scale, the same scenes were enacted in Oakland as here, and it was with difficulty that the Thomas car got to the ferry. The car will remain here for a thorough overhauling, and will be shipped to Seattle in time to take the boat to Valdez, Alaska, which sails on April 1. George Schuester will take charge of the car from now on, and expects to find the Alaskan rivers frozen, so that they may be used as highways, otherwise he does not expect to be able to make a great deal of progress until fall.

The Thomas success is not alone a great triumph for that car, but one of the greatest that has ever been achieved by the automobile, as it was generally predicted at the start that none of the contestants would ever get across before spring. What making the trip across the continent in the dead of winter in such a short time means may be realized from the fact that the Thomas record is little more than eight days longer than that of Whitman and Carris, of 32 days 23 hours and 40 minutes, made in a Franklin.

Daily mileages are becoming greater as the Thomas car gets further West, as on Wednesday, March 18, which was the thirty-sixth

day of the race, the car covered 141 miles, arriving at Ely, Nev., and pushing on 40 miles further before stopping for the night. The telegraph wires were left behind at this point, the next point of communication being Goldfield, Nev., 185 miles distant. The Pierce acted as pilot as far as Ely, the little Reo "rabbit" having lost two tires at Cobre, which could not be replaced. For the stretch to Goldfield, another Thomas acts as pilot car. The Zust, which is now about 500 miles behind, came near ending its chances for good March 18, only the quick wit of the driver and the fact that the axle caught on the brink preventing the car and passengers from going into a ravine.

Goldfield went wild over the arrival of the Thomas, which did not reach there until Saturday morning, owing to being stalled in the mud west of Ely, and later breaking a differential pinion. The whole population stayed up the greater part of the night, awaiting the racer, but was disappointed. The Thomas made the run of 30 miles from Tonopah in 58 minutes, and was greeted on its entry by the ringing of the fire bell, which was the signal for the gathering of the various entertainment committees. The entire town was decorated.

When near Spring Valley, Wyo., the Zust crew found themselves followed by a pack of timber wolves, and only succeeded in driving them off by shooting twenty, the pelts of which will net the ranchmen who gathered them next day some \$200 in bounties. Its arrival in Goldfield placed the Thomas 605 miles ahead of the Zust, which passed Evanston, Wyo., the same day. The DeDion was then at Cheyenne, Wyo., 1,013 miles back; the Protos at Ogallala, Wyo., and the Motobloc at Carroll, Ia., where it gave up and was shipped by rail. The Union Pacific officials would not permit the Zust to use the railroad right of way or go through the Aspen tunnel, because of the damage done the loose gravel ballast by the Thomas. Sirtori was compelled to take his car over the mountains and has made this the ground for a protest.

The car crossed the California line Saturday, March 21, and then had 800 miles between it and San Francisco. It had been expected to reach there in time to take the train for Seattle Saturday night, but the accident on the Nevada desert, when away from telegraphic communication, spoiled its chances. E. R. Thomas, of the Thomas Company, awaited the arrival of the car all day Sunday at Dagget, Cal., but Brinker made a short cut over the mountains to Mojave, where his arrival was quite unexpected. The mileage for the last seven days:

Car	Country	Day 36	Day 37	Day 38	Day 39	Day 40	Day 41	Day 42	
Thomas	(America)	2,859	2,859	3,065	3,119	3,451	3,632	3,832	
Zust	(Italy)	2,390	2,390	2,460	2,536	2,536	2,616	2,636	
De Dion	(France)	1,690	1,878	2,052	2,166	2,226	2,345	2,390	
Protos	(Germany)	1,627	1,767	1,878	1,950	2,109	2,109	2,226	
Motobloc	(France)	1,439	Shipped by rail, March 18.						

Arrival of Thomas at Castle Rock, Green River, Utah.

MULTIPLE UNIT SYSTEMS OF TRANSPORTATION*

By JOSEPH A. ANGLADA, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

WITHIN the past few years it has been proven by users in general that, aside from the advertising value of commercial automobiles, which exists in few cases at present, the employment of auto trucks of over 6,000 pounds load capacity is not as profitable as the employment of smaller vehicles. The rapid depreciation of rubber tires in general use, and of the power-generating apparatus, necessitating frequent repairs and replacements, are the chief reasons for the above state of affairs.

A few vehicle manufacturers and users have attempted to solve the problem of expensive tire renewals by the use of various types of wooden and combination tires, and the use of resilient wheels. However, considering that by far the greater number of commercial automobiles of all types are still using and being equipped with rubber tires of the same general type used for the past eight or ten years, it seems that solid rubber tires, expensive as they are in all respects when used on large vehicles, are at present the most satisfactory solution of the problem. An objection to fabric and wooden tires is that, while they perform the work required of them, they disintegrate more rapidly than is commercially allowable, and because of their comparatively non-resilient materials, the tires become loose in the fastenings securing them to the wheels. The inability to absorb the rapid blows produced by encountering small inequalities of the road surface also counts seriously against these tires.

Various forms of combination tires, such as an outer solid tire of a comparatively tough material, which rests upon a pneumatic or spring cushioned part, and spring wheels of various types have been tried, but, as stated above, the old-style solid rubber tire is still the most satisfactory. A form of composite tire is shown by Fig 1. This tire was tried for a while on a five-ton brewery truck, but failed because the parts were not properly proportioned. It consists of a solid rubber tire of the usual form, capable of carrying about one-half the total weight on the wheel. This tire is placed centrally between two steel tires designed to slightly more than carry the balance of the weight. The rubber tire is intended as the traction furnishing and resilient member because it projects slightly beyond the steel tires. The steel tires will protect the rubber when additional loading of same would be injurious. For instance, when crossing a street car track with the ordinary rubber tire the pressure is concentrated on a small section of the tire with occasional injurious results. In fact, in the majority of cases with large vehicles the tires are seldom considered worn out because the tire has worn down to a small cross-section, but because the tire has been split in places and chunks of rubber have been cut out, or the fastening is no longer secure. The steel tires in combination with the rubber should not permit this to occur. However, in my estimation, it will require a long time and the expenditure of a large sum of money to develop a thoroughly commercial tire for a vehicle exceeding three tons load capacity.

Another objection to the use of large trucks is their inability to exert sufficient tractive effort under all conditions of loading and road surface. As a remedy, some manufacturers furnish sand boxes for delivering sand under the driving wheels,

*Paper read before the Society of Automobile Engineers at Boston.

as in railroad practice, while others endeavor to overcome this difficulty by driving all four wheels. The first method is an unsatisfactory makeshift, while the latter necessitates expensive complication of the propelling and steering mechanisms, with the extra weight of these parts assisting depreciation.

The six-wheel vehicle is a step in the right direction, but the complication inseparable from this arrangement and the expense of building and maintaining this complicated construction detracts seriously from the attractiveness of the six-wheel proposition. Unless at least four wheels are driven, the traction disadvantages of the two-wheel drive are always present. When four or six wheels are driven, the objections stated above also count against this system.

The system employing a tractor and trailers is used abroad to some extent, and has the advantage of distributing the load on a number of wheels. But the objectionable feature of having but one pair of driving wheels counts seriously against the system; because unless the driving wheels are provided with cleats to assist propulsion, it is impossible to haul a paying load at all times, and even with cleats above it is not

Fig. 1.—Combination steel and rubber tire.

possible if the road has deep sand or mud upon it. The use of cleats is objectionable because they cause the load on the driving wheels to be concentrated on comparatively small areas of the road surface, causing it to deteriorate rapidly.

Colonel Renard realized the shortcomings of the above system when he developed the road-train system which bears his name. It consists of a train of vehicles, the leading vehicle having mounted upon it the power-generating, speed-controlling and steering apparatus. A shaft arranged with the proper number of universal and slip joints extends throughout the length of the train and transmits the power for propulsion to the driving wheels of each vehicle. Thus it is possible to carry a large and, therefore, a well-paying load without having excessively large individual vehicles, causing rapid depreciation of same due to the inability of providing resilient tires or wheels or springs for carrying heavy loads. The road surface is also protected, because the unit load on the same is reduced, the weight being distributed on a greater number of wheels and therefore on a greater area of road surface. In addition, rubber tires are not necessary, because sufficient tractive effort is obtained by the increased number of propelling members. Steel tires may be used on the trailing vehicles, because there is no mechanism except the comparatively simple propelling and steering apparatus mounted on them, and on the leading or power-furnishing

Fig. 2.—Elevation of gasoline-electric power wagon and independently driven, self-steering multiple units.

Fig. 3.—Gibbs gasoline-electric power wagon, used for mine haulage.

vehicle rubber tires are allowable, because in no case should the weight of the vehicle complete with apparatus weigh more than three tons. It seems to the writer, after studying the Renard system, that its advantages may be retained and the complication of the power-transmitting and controlling apparatus reduced and these parts made more efficient by the use of the system shown diagrammatically by Fig. 2.

The leading vehicle has mounted upon it the steering and control apparatus, a source of motive power, storage battery, steam or internal combustion motor, but preferably the latter, on account of its simplicity and small weight per horsepower. The motor is coupled to an electric generator which furnishes current to a pair of electric motors on each vehicle. The vehicles are connected by means of a bar which transmits the steering effort from the drawhead at the rear of the leading vehicle to the front axle of each following vehicle. The length of this bar and the position of the front axle are so determined in reference to the rear axle of the leading vehicle, that the entire train follows the same course when turning. The vehicles are also connected by flexible electric conductors, arranged so as to be readily connected or disconnected when it is desired to place a vehicle in or out of the train.

Three methods of control suggest themselves:

First, the ordinary method of operating the internal combustion motor at a constant speed to obtain a constant voltage at the generator, and then, by means of a series-paralleling controller, connecting the fields and armatures of the motors in various combinations, virtually as done in street car and electric

train service on elevated and subway lines at the present time.

Second, a method in which by varying the speed of the generator its voltage is varied correspondingly, causing a proportional current to flow through the motors, making their speed and torque vary.

Third, a method whereby varying the voltage of the generator, by changing its field excitation, its speed meanwhile remaining constant, causes an effect similar to that of the foregoing method. It would probably be found advisable to obtain the field current for the generator from an exciter mounted on the end of the main generator shaft, to save weight, and having its output controlled by the driver of the train.

With the two latter methods, it would also be found advisable to provide a switch for connecting the two motors on each vehicle in series combination for climbing grades and for starting when the train was fully loaded. This switch could also be used for reversing the direction of rotation of the vehicle motors.

The generator should be designed to furnish a direct current at 220 volts and the windings should be so arranged that when the output of the generator nearly equaled the output of the gas motor, the voltage of the generator would decrease and thus decrease the current flowing to the vehicle motors. This feature, while not absolutely necessary, is desirable because at no time is it possible to overload and stall the gas motor by careless operating. For instance, consider that the motors of the train, which are 220-volt direct-current series motors, are operating in multiple combination, and that the train approaches a grade which requires more power than the gas motor can furnish to the motors in multiple combination. The generator voltage would decrease and thus prevent the vehicle motors and the gas motor from being overloaded, and if the driver should persist in not operating the switch to connect the vehicle motors in series combination, the train would come to a standstill if the power required was greatly in excess of what the gas motor can supply. It is seen that by connecting the vehicle motors in series combination the effect of changing to a lower gear of about twice the reduction is obtained with a corresponding drop in speed and increase of torque.

It is generally known that in the existing types of electric commercial vehicles the chief, and, in fact, generally the only feature which prevents them from being ideal is the battery. The motor rarely, if ever, gives trouble and requires little attention; therefore, it seems that, with the exception of the generator, the reliability of which is beyond suspicion, the only other parts of the electric system which might give trouble are the conductors carrying the current to the motors and the controller, of whatever type it may be. The reliability of these is proven by the successful daily operation of such apparatus on railways.

A train such as here described would be useful for many purposes. Besides being adapted for the transportation of goods and passengers in sparsely populated sections, it would be quite suitable for use in congested districts, owing to the ease of control, combined with its ability to accelerate and stop quickly, due to the fact that each vehicle is self-propelled and braked.

The train would not weigh more than a train equipped with an entirely mechanical transmission, and would not cost as much to build. It would operate more efficiently and the cost of maintenance would be less.

In this country multiple unit road trains have been constructed by the Gibbs Engineering and Manufacturing Company and Alden Sampson. The first Gibbs train consisted of a power wagon and two trail wagons. As shown by the photograph, the power wagon has mounted upon it a three-cylinder gasoline engine direct connected to a generator furnishing power to motors driving the rear wheels of all the vehicles. The leading vehicle is equipped with solid rubber tires and the trailers have iron tires. The speed of the train was regulated by a two-motor street car type controller so modified that by operating the drum intended for reversing the car motors, the

Fig. 4.—Gibbs electric units used with foregoing tractor.

vehicle motors, which were regular series wound electric vehicle motors, would be connected in series or multiple combination. The main drum of the controller was used to connect resistance in or out of the motor circuit. No provision was made for reversing the trailers, but separate switches were provided for that purpose on the power wagon.

The second Gibbs train consists of a power wagon and four trailers. The power wagon has mounted upon it two three-cylinder gasoline engines driving a double commutator generator through positive clutches on the engine shafts and Morse chains. The rear wheels of all the vehicles are driven by series motors through gearing and roller chains. The photograph gives an idea of the construction of the road wheels, which are steel discs flanged at the outer circumference. The discs are riveted to bronze bushed steel hubs and steel tires eight inches broad. Speed regulation is obtained by means of a controller similar to the one used on the first train, with the exception that the controller drum generally used for reversing the car motors is in this case used to connect the two windings on the armature of the generator in series or parallel. The main drum

ELECTRICAL MEASUREMENT OF TEMPERATURES.

PROFESSOR H. L. CALLENDAR and W. E. Dalby described in a paper recently read before the Royal Society a form of platinum thermometer which measures directly the temperature of the gas in the cylinder of a gas engine at some one point of the cycle, says *The Engineering Digest*. In order to avoid uncertain corrections, it is necessary in any attempt on this problem to employ wires fine enough to follow the changes of temperature of the gas very closely during suction and compression. If such a wire be employed under working conditions, it must be perfectly screened from the flame during explosion. The arrangement designed by the authors is such as to introduce the thermometer into, and withdraw it from, the cylinder at the proper instants, and to do this without making any change in the usual form and extent of the clearance surface during the time interval comprising the end of compression. The thermometer itself consisted of a loop of platinum wire 0.001 inch in diameter and 1 inch long, and a compensation loop of similar wire was provided to eliminate the end effects arising from conduction to the leads. The current employed in meas-

Fig. 5.—Another example of the same type of gasoline-electric road train made by the Gibbs Engineering Company.

of the controller is used to connect resistance in or out of the motor circuit. Each vehicle has a switch for reversing the motors.

This train was used to transport machinery and supplies from a railroad to a mine in Arizona. The route is one hundred and fifteen miles each way and leads through a desert and mountainous country.

The Alden Sampson train, which was exhibited at the last Madison Square Garden show, consists of a power wagon and two trailers, the former carrying a four-cylinder gasoline motor, driving a dynamo by a silent chain. The power plant, which occupies the forward part of the vehicle, is mounted on a separate spring-suspended frame, while the rear part is arranged for carrying a load. All the vehicles are of the six-wheel type, the large center wheels being independently driven on all of the vehicles. In its general features the train resembles the Renard type, the chief difference being that the French train is mechanically and not electrically driven. The trailers are double-ended, so that they may be operated in either direction.

It is a mighty poor plan to come to the conclusion that just because a certain thing about the motor was the cause of deflection but a short time previous, it is again to blame. Some amateurs get "carbureter crazy"; others are afflicted with a streak of "batteries"—they can't imagine a condition of affairs that a bad battery did not contribute to, and so on down through the list, different drivers getting various ailments.

uring the change of resistance (which was practically 1 ohm for 100° C. rise) was about 1/200 ampere. This thermometric arrangement was contained in a small valve inserted through the spindle of the admission valve, which was bored out to receive it. This thermometer valve was introduced into the cylinder by a cam operated by a simple gear. In order to measure the temperature at a definite point of the cycle, a periodic contact-maker was inserted in the testing battery circuit. This consisted of two cams on the same axle and two brushes. The shape of each cam was a flat spiral, which lifted the corresponding springy brush away from the axis as the shaft rotated, and the spirals each terminated with a step which allowed the brushes to fall suddenly. The steps were staggered in angle, so that the brushes fell at different instants. As one side of the electrical contact was carried by one brush, and the other side of the contact by a projection on the second brush, by setting the cams initially at the proper angle, any desired period of contact could be brought about at any desired point of the gas-engine cycle. This method has the advantage that it can be applied without difficulty to any existing engine by simply making a special admission valve. It is absolutely necessary in such investigations that the engine should repeat a perfectly regular cycle at each explosion. No results of any value can be obtained with a hit-and-miss governor in operation, because the conditions vary too greatly from stroke to stroke, and it is manifestly impossible to arrive at any definite conclusions from records made with an engine that is seldom twice the same.

GYROSTATIC ACTION—ITS EFFECT ON STEERING*

By WILLIAM W. WATSON, D.Sc., F.R.S.

THE motions of a gyrostat are to most persons a subject of very considerable interest on account of their apparently mysterious nature. The wheel seems, when in motion, to possess volition of its own, and while setting at defiance all the laws of Nature, only obeys some law such as that followed by the Irishman's pig. On account of this mysterious behavior of the gyrostat it has often been suggested as an "explanation" of various events the causes of which are unknown. Thus, when the *Cobra*, the first destroyer to be fitted with turbine engines, was lost in the North Sea, the hull having apparently broken in two, it was suggested that the gyrostatic action of the rapidly rotating turbines had caused such a severe stress as to fracture the hull. In the same way the Salisbury railway disaster was by some attributed to the gyrostatic action of the wheels of the locomotive. Finally, gyrostatic action has been suggested as affecting the motion of a motor-car, and in this paper I propose to consider in what ways and to what extent such an effect is likely to be produced.

An elementary explanation of the action of a gyroscope can easily be given, and will be easily followed if the following considerations are kept in mind. When a body is in motion every autoist is acquainted with what is meant when we say it possesses momentum, and that this momentum depends both on the mass of the body and the velocity with which it is moving; and to change the momentum in any direction, we must act on the body by a force in that direction. Further, the change in momentum produced in a given time is equal to the product of the force which is causing the change into the time. In the case of a rotating body we have a similar set of considerations which may not be quite so familiar. Thus every rotating body possesses angular momentum, which depends on the velocity of rotation, and what is called the moment of inertia, which itself depends on the mass of the body and the distances of the various parts of the body from the axis of rotation. The angular momentum of a rotary body has not only a particular value for any given speed of rotation, but it has also a definite direction—namely, that of the axis about which the rotation is taking place. To change the angular momentum of the body we have to exert a twist or couple, and the magnitude of the change in angular momentum about any axis in a given time is equal to the product of the value of the couple into the time. Finally, we must remember that the angular momentum about any axis may be increased in two distinct ways—either (1) by increasing the speed of rotation about this axis, or (2) by so tilting the body that a spin, which already exists about some other axis, is changed so as to be more nearly coincident with the given axis.

It has often been suggested that the gyroscopic action of the flywheel on an automobile, particularly in the case of horizontal engines with heavy flywheels and having the axis of rotation athwartship, may tend to appreciably assist in preventing side-slip. It has been shown that such an action will only occur if the axis of rotation of the flywheel can tilt when the car rotates. This tilt can only occur by the give of the springs, and it is a matter for calculation to see if any appreciable effect can occur. Although a rigorous calculation would be a matter of enormous difficulty, an approximate solution is quite easy. This approximate solution is sufficient for our purpose, for it will give an upper limit to the quantity required, and, as we shall see, even this is insignificant. The author has taken the numerical data from his own car, which has a single-cylinder horizontal engine.

The weight of the rim of the flywheel is 80 pounds, its outside diameter 20 inches, and moment of inertia 46 foot-pounds, the speed of rotation being 1,000 revolutions per minute. A

couple of hundred pounds at an arm of one foot will tilt the car through seven minutes of arc. Now, suppose the car starts turning, and completes a whole turn in one second, the speed of rotation increasing at a uniform rate throughout. Then the outside value for the gyroscopic couple resisting turning is about six pounds at an arm of one foot. This is quite insignificant, and is so small because of the fact that the springs of the car prevent the axis of the flywheel tilting. This effect was illustrated by a small model car, fitted with a heavy flywheel. When the axis of the flywheel is clamped to the *chassis*, so that the only tilt that can take place is due to the give of the springs, the model side-slips just as badly when the flywheel rotates as when it is at rest. When, however, the axis of the flywheel is allowed to tilt with reference to the *chassis*, only being restrained by a light spring, then the gyroscopic effect comes into play, and the model no longer side-slips.

Another problem is to the effect of the gyroscopic couple called into play when the car rounds a curve. The ratio of the gyroscopic couple to the centrifugal couple tending to capsize the car is—

$$\frac{C \omega}{V h W}$$

where C is the moment of inertia of the flywheel, ω its angular velocity (radius per second), V the speed of the car in feet per second, h the height of the center of gravity of the car above the ground, and W the weight of the car. Taking W as 1,900 pounds, h as 2 feet 9 inches, and the flywheel being that already considered rotating at 1,000 revolutions; then the ratio at 10 miles per hour is .056, at 20 miles per hour is .028, and at 30 miles per hour is .019. Here, again, the effect is insignificant.

Finally, we have to consider the effect of the gyrostatic action of the front wheels in the steering. When a front wheel goes over a stone the axis is rotated, and hence a couple is produced tending to turn the wheel in the direction so as to steer the car away from the side struck, and this effect tends, with the ordinary form of that axle, to reduce the shock in the steering connection produced by the impact with the stone. Taking a 760 by 90 mm. wheel, which has a moment of inertia of 31 foot-pounds, a car having a tread of 56 inches and proceeding at 30 miles per hour; then if we suppose the wheel to lift one inch while the car moves forward two inches, the gyroscopic couple would be equal to 320 pounds at an arm of one foot. This might be of some effect, only the example taken is certainly an extreme case, for the pneumatic tire would decidedly prevent any such rapid rise of the wheel. Further, as has been already pointed out, the blow of the wheel striking the stone will cause a couple in the opposite direction to the gyrostatic couple. It will thus be seen that under present conditions the gyroscopic action of the various rotating parts of a car produce no appreciable effects. If, in the future, cars are driven by gas turbines, which will almost certainly be of the De Laval type—it may, however, be otherwise.

The model exhibited shows one way in which gyroscopic action may be used to minimize side-slip, but the method is not a practical one, for the size and weight of the gyrostat when used in this way would be prohibitive. If, however, the Brennan arrangement were employed, a comparatively small gyrostat would be efficacious, and in the event of all studded tires being prohibited, might be found worth the additional expense.

From what has been said it will be seen that in the use of the automobile, which, of necessity, possesses such large lateral stability, gyroscopic action is of little practical importance. When, however, we come to the submarine and aeroplane it is quite otherwise, and gyrostatic action will have to be taken into account, or eliminated by the use of twin engines.

*Paper read before the Royal Automobile Club, London.

LETTERS INTERESTING AND INSTRUCTIVE

SOME FRAME WEIGHTS COMPARED.

Editor THE AUTOMOBILE:

[1,256.]—For some time I have been considering the purchase of a well-known American car, which I am satisfied is of the highest grade in every respect, except possibly in the fact that it has a wooden frame. However, the local agents for this car not only claim a reduction of vibration and other merits for this frame, but actually contend that it is stronger and lighter than a steel frame. Now I know that in the earlier history of the automobile industry wooden frames were very common, yet to-day only a few manufacturers persist in using them. Surely there must be some very good reason for this, and, if there is, naturally I am going to consider it in the purchase of a car. So I am writing to ask you your opinion on the wood frame matter, with a view to learning on good authority whether it really possesses the advantages claimed—especially the ones I have mentioned—and of finding out what the objections are that offset these advantages.

Covington, Ky.

CARL MILLIKEN.

The great objection to the wood frame always has been the difficulty of making the various attachments between its parts and the elements that must be mounted upon it as strong as the wood itself. Wood, of properly selected and high qualities is, weight for weight, one of the strongest structural materials known, comparing favorably with alloy steels in this respect. This is because its porous microcellular structure is practically equivalent to an enormous number of minute trusses, by means of which weight is kept down and resistance to transverse, compressive and torsional stresses, as well as to those of tension, is abundantly provided. An idea of what this amounts to practically can be had from the fact that an ordinary channel frame member four inches deep, two inches wide and one-eighth of an inch thick weighs more for each running inch than a solid pine beam two inches thick and eight inches deep. In this connection it is interesting to note that some of the very lightest wood—pine, spruces, ash, etc.—are the strongest; oak, hickory, and other hardwoods, though stronger for a given size, being less strong in proportion to their weight. A further advantage of wood over most steels is its dynamic resistance, it never fracturing without considerable bending and ample warning. It is, moreover, both easier and cheaper to repair. As for the merit of wood frames on any particular car, the question is one to be decided largely by individual preference and by the reputation of the manufacturer. A few designers have undoubtedly perfected remarkably substantial methods of joining wood frames together, and, though it is true that these frames are found in only a few makes of cars, it is to be remembered that some of these makes are ones especially noted for enormous outputs of most serviceable machines, so that the wood frame is regularly giving satisfaction in many quarters.

FURTHER CORRECTIONS FOR DR. HARD.

Editor THE AUTOMOBILE:

[1,257.]—In the issue of March 12, letter No. 1,229, signed by A. D. Hard, he says, "the faster the wheels turn the motor, the greater will be the resistance to be overcome, and the slower the car will move," and then says, "if we wish to use the motor as a retarder to car movement, we will get the greatest service by using high gear." If he means maximum braking effect by "greatest service," it seems as if he has made a mistake, even if he is a mechanical engineer and writes on the practical side, for the motor will be turned faster by the car on the low gear than by the same speed of the car and the high gear. It is a natural mistake, but high gear doesn't mean a big gear ratio between the engine and road wheels, but a small difference in speed between the engine and the wheels.

A SUBSCRIBER.

Kingston, R. I.

Mr. Hard is an "M.D.," not an "M.E.," the latter being a typographical error that went through unnoticed in the issue in which the letter referred to was published.

CAUSE OF LAMP MIRRORS BREAKING.

Editor THE AUTOMOBILE:

[1,258.]—An acetylene headlight that I use on my car has been found to have a cracked mirror, which I contend must have resulted from an original flaw in the glass or some similar cause, as there has been nothing else that could have produced the break. The matter has been the occasion of some argument with the dealer who sold the lamps, he contending, in justification of an unwillingness to replace the mirror, that it probably broke from heat, as by putting in too large a burner or by having too great a gas pressure. Since the lamp has been in use for some months under absolutely uniform conditions, with the gas supplied by a carefully regulated Prest-O-Lite tank and there has been no change in burner or adjustments, I cannot see it this way, and would like to know if you can suggest anything that will be positive evidence of just what occurred. I have always understood that these mirrors are of a heat-proof glass and that it is not possible for them to crack in the manner of an ordinary lamp chimney unless flawed or defective to begin with.

JOE FINK.

Atlanta, Ga.

The fact, as you state it, that the lamp was in use for months without trouble constitutes proof that is almost positive to the effect of something happening just prior to the breakage. There is no such thing as heat-proof glass, the heavy lead glass usually used for lens mirrors being simply more heat-resisting than other kinds. But even it will break when unequally heated to a sufficient degree, which might have resulted in any one of several ways. Have you lit the lamp since the mirror broke? If not, we think you will find that the arm of the burner tip nearest the mirror is stopped up from dust or carbonizing, with the result that the flame from the opposite arm has not been stopped by the other impinging upon it, but has shot across and overheated the mirror. This is a common cause of the trouble you speak of, and can happen when the rear arm is completely obstructed or just enough so to destroy the balance of the flame.

WIRELESS TELEGRAPHY IN AUTO ENGINES.

Editor THE AUTOMOBILE:

[1,259.]—Can you tell me if any satisfactory explanation ever has been offered for the increase of power that results with both sections of a double ignition system working at once? I have a car fitted with both high and low tension ignition, and I find that when it is running on either ignition, set switching or the other, in addition gives a material increase on the power—especially noticeable in hill climbing, for instance. At first I thought the effect was due to the more rapid ignition of the magneto that furnishes the low tension ignition, but subsequently I found that the same result was produced when, while running on the magneto, the battery system also was brought into action. I am pretty familiar with most ignition theory and practice, and am especially disinclined to subscribe to the "fat" spark creed, which might afford a possible explanation of the condition which I have encountered and which I am led to understand, has befallen the experience of many other car users. An electrical engineer of my acquaintance suggests that the merit of two ignition systems, whether twin or different, may possibly be due in some way to Hertzian waves produced by one discharge, breaking down the resistance adjacent to the other—a sort of wireless telegraph effect, so to speak. And this friend further advances the startling opinion that the merit of the once popular spark gap may have had its explanation in a similar principle. Do you know of any data—corroborative or contradictory of these suggestions—that throws any light on this interesting subject? I am sure that there are many others besides myself who will read any information you can dispense or produce.

Austin, Texas.

C. E. ENGLEHART.

Your letter certainly raises a number of interesting questions, upon which we shall be pleased to have our readers' comment. The idea of a Hertzian-wave effect, while at first consideration apparently very far fetched, may after all have much of merit in it. This much is certain—there is no man living who knows all that really goes on within the cylinders of an internal combustion motor, which being the case, no one can deny much more

positively than another can affirm the supposed facts on any given proposition of sufficient abstrusity. Some time ago a Freuchman patented the idea of employing a disruptive discharge outside the cylinders for the purpose of lowering the resistance inside, but beyond this single fact we know of nothing definite on the subject. A very little experimenting would throw more real light on the matter than pages of speculation, and it is not impossible that some information may be in possession of people who will read this. For instance, some one may have noted whether or not there is a difference in the value of the spark gap at different distances from the cylinders. It assuredly could be argued that if a fairly powerful discharge can be made to procure a lowering of the resistance between loosely-contracted iron filings thousands of miles away, at least as much might be expected from a less powerful discharge, acting upon a very short air gap only a few feet away. And the fact of the effect appearing, despite intervening walls of metal, would be no violation of anything that is known of the principles involved in wireless telegraphy.

MORE ABOUT BRAKING WITH THE MOTOR.

Editor THE AUTOMOBILE:

[1,260.]—I am inclined to think that Mr. Hard has made a slight mistake in his letter No. 1,229, relating to the use of the motor as a brake. Accepting the theory that the braking effect is produced by friction of motor action, I believe that we would secure greater resistance by placing the low gears in mesh instead of the high, which he suggests. Mr. Hard can certainly see that the motor would revolve more rapidly, or a greater number of times in a given distance of car travel, by driving it through the low gears than by driving it direct or through intermediate gears, consequently more friction would be produced, which is the desired result. His statement in regard to using the motor as an emergency brake after coasting with motor released, while true in a certain way, is slightly misleading. The impression is given that if in an emergency it should be necessary to use the motor, the liability of damage to gears and motor would be less by using the low gears. Owing to the great difference in peripheral speed of the low speed pinions, the liability of damage would be greatest in using this set and in a descending ratio until least in the high speed direct drive, where the shock is taken by a jaw clutch instead of gear teeth. This correction applies more generally to the sliding gear types of gear changes, but is true of the planetary as well. I do not believe that good practice will permit of motor-braking through any gears other than direct drive.

In case I am wrong in this, I would thank you for an explanation.
ANONYMOUS.

There is naturally less resistance to be opposed to a shock when the motor is started with the high gear engaged than when one of the lower speeds is being employed, and we believe it to be quite general to coast with the direct drive in when using the motor as a brake, although instances are not wanting where the low gear is utilized, especially if the hill be particularly long and steep in order to afford as much assistance as possible to the running brakes.

RELYING UPON A MAGNETO ALONE.

Editor THE AUTOMOBILE:

[1,261.]—Can a good magneto alone be relied upon for ignition, without having a battery and coil for reserve? Is there any disadvantage in using leather treads studded with steel rivets? If it is a good thing and cuts tire expense in two, why don't practically all owners use them, especially as it reduces the liability of puncture? Is a cast iron exhaust valve head any better than a one-piece forging? Does a two-cylinder engine have any more than double the power of one cylinder? Some say it does and others say not.

Peru, Ind.

A great many foreign cars in use on the other side—thousands in fact—have no other form of ignition than a magneto. Tires, or treads, of this type consume considerably more power in driving the car than where plain treads are used, and we do not believe the life of the tire is as great when they are used, though they prevent punctures and similar unpleasantness. Whether a cast-iron exhaust valve head is better than a one-piece forging will depend upon the material employed in the forging. For a cheap form of construction the valve with cast-iron head gives satis-

factory service, as the material is heat-resisting to a high degree. One-piece forgings are frequently made of nickel-steel and other alloys having similar heat-resisting properties. A motor having two cylinders of the same dimensions, and operating at the same compression and speed, should give approximately double the power of a single-cylinder motor of the same characteristics, it being customary in figuring the horsepower of multicylinder motors to calculate that of one and multiply by the number of cylinders.

REGARDING PUMP SYSTEMS OF FUEL FEED.

Editor THE AUTOMOBILE:

[1,262.]—Have automobiles ever used a pump and distributor in place of a carbureter to supply fuel to the cylinder? I never heard of one doing so, and there must be some great disadvantages in the system or some makers would undoubtedly give it a trial. Some such simple variable stroke pump with distributor, as was outlined by Mr. Lougheed last summer in "Motor Age," would seem to be far simpler and more reliable than a carbureter. The fact that the most efficient engines in the world, the Antoinette and Diesel, employ this means proves that it can be used, and used satisfactorily, too. What are the objections to its use on automobiles?

Evanston, Ill.

EVANSTON.

We do not know of any such system ever having been used on an automobile motor, but the mere fact that no builder of cars has seen fit to give it a trial cannot be taken as evidence that it has any great inherent disadvantages. Automobile manufacturers are in business chiefly to build and sell automobiles, and in order to do this successfully, they must work along the lines of least resistance, which means giving the public what it wants. There does not appear to be any reason why such a system cannot be successfully applied to an automobile motor, but as long as fuel costs are not excessive and the carbureter is fairly efficient, the demand for improvement will not be keen. Auto buyers had their fill of investing in experiments in the early days, so that a car to sell nowadays must be along currently approved lines. Improvement is not the work of a day, but must come as the result of development and evolution, and they represent a tedious and expensive process that the average maker does not wish to bear the cost of.

USING OLD SHOES AS TIRE PRESERVATIVES.

Editor THE AUTOMOBILE:

[1,263.]—As a subscriber to your valuable magazine, I would like to take advantage of your columns open to those seeking information. Is it practicable to put an old shoe over the tire on a car and hold it in position by lacing it to the wheel? In my locality there is a great deal of rough stone on the roads, which is very destructive to tires. If an old shoe could be strapped over the tire proper, it would take up all the surface cuts, which now ruin my tires very rapidly. I am aware that the resiliency of the tire would be somewhat affected, but the saving in tire expense would compensate me for that. If practicable, what size shoe would best fit over a 28x3 tire? Also, would the slight increase in the circumference of the driving wheels materially affect the gearing?

Grantwood, N. J.

F. P. W.

At least one case has come to our attention where this has been done with very satisfactory results. The experience in question was outlined in a short article by A. D. Hard, M.D., a Minnesota doctor, and appeared in THE AUTOMOBILE during the first half of 1907. If we recollect aright, Dr. Hard's procedure was simply to take an older shoe that was no longer fit to serve as the sole outer covering of an inner tube, and by means of holes punched along its edges, lace it directly over the complete tire, this applying particularly to the rear wheels. According to his account, the resiliency of the tire was not affected to a very marked degree, and the saving was considerable. The increase in diameter would not have any appreciable effect on the gearing of the car. Discarded shoes of the same size were used.

ABOUT AUTO TIRE PUMPS AND COMPRESSED AIR.

Editor THE AUTOMOBILE:

[1,264.]—Is there any power pump manufactured and for sale which gives entire satisfaction by which you can pump your tires with the motor of an automobile? You advise a Spencer pump. Is it satisfactory? A short time ago I saw a statement in "The

Automobile" telling of cleaning carpets with the motor of an automobile by a San Francisco concern. Can you give me any more information about it? If carpets can be cleaned by the compressed air of an automobile, it is one of the greatest boons to the home in this generation. If the required apparatus for this work is not manufactured and for sale, a splendid field is open to somebody. We have had our homes cleaned by compressed air, with fine results, by a cumbersome machine which made it very expensive. Pasadena, Cal.

A. I. GAMMON.

There are a number of such pumps on the market and, so far as we know, most of them have proved satisfactory in service, though we cannot lay claim to having had personal experience with any of them. When it is a matter of inflating a five-inch rear tire to the required pressure when near the close of a long day's drive, a power pump is certainly a friend in need. The idea of house, or carpet-cleaning, with the aid of an automobile is not novel, as outfits of this kind have now been in steady service in New York City for three or four years past. A vacuum, instead of compressed air, is generally employed, and after arriving at the point where the work is to be done, the auto engine is used to drive the vacuum pump and various lines of hose are led to the rooms to be cleaned. The vacuum sucks the dirt into the pipes and deposits it in a tank of water on the car.

ROUTE FOR ACROSS NEW ENGLAND TRIP.

Editor THE AUTOMOBILE:

[1,265.]—Will you kindly answer in your next issue the following: I have a party who is intending to make a trip down through Maine from Stamford by way of Springfield, Mass. Can you or any of the other readers of this magazine give me the best route to take, and if I will have to register in States I pass through. Stamford, Conn.

F. N. P.

The principal route would be along the shore line to New Haven, then up through Hartford to Springfield. From the latter point there are a number of routes, the best leading through Worcester, Northboro, Marlboro and Weston. From Boston, there is a still greater number of routes to choose from, the main line running through Lynn, Salem, Ipswich, Newburyport, Mass., Portsmouth, N. H., and Biddeford and Saco to Portland, Me. The directions beyond the latter city will depend entirely upon the destination of the trip. The entire route from Stamford to Portland, with the exception of comparatively few miles, has been rewritten for the 1908 edition of the "Official Automobile Blue Book," which is now in press, and will be ready by April 1. In addition, it gives complete detailed information concerning the roads, garages, hotels and State laws. Your Connecticut registration will be good for the trip.

ARE THERE ANY SUCCESSFUL AIR-COOLERS ?

Editor THE AUTOMOBILE:

[1,266.]—Are there any thoroughly successful air-cooled motors built? If so, by whom? If not, is there a demand for an air-cooled motor that will do all that a water-cooled motor will? Mt. Zion, Ind.

G. W. BROWN.

Your query savors of a rare lack of knowledge of what has been going on in the automobile world during the past five or six years. Have you never heard of the Franklin, Knox, Marmon, Corbin, or Frayer-Miller cars? The many hundreds, if not thousands, of these makes that are in daily use in all parts of the country would appear to be ample evidence of the fact that successful air-cooled motors are not a rarity by any means.

IRREGULAR FIRING OF ONE CYLINDER.

Editor THE AUTOMOBILE:

[1,267.]—I operate the two-cylinder Autocar—1907 Runabout—and for some time I have observed that by cutting out cylinder No. 2, by holding down the trembler when the motor was at good speed, the engine would almost or perhaps quite stop running. To give cylinder No. 1 the same speed requires much earlier spark and more throttle than does No. 2 for the same speed. The lack of harmony in velocity of the two cylinders, of course, results in loss of power, and perhaps may damage the power plant finally. The ignition does not seem at fault, as I can trade lines and coils without remedying the sluggish engine and without retarding the more

active one. The exhaust and inlet valves have been scrutinized and the compression is good. Have I loose connections at the piston end of crankshaft, or what must I look for next?

Farmland, Ind.

L. N. DAVIS, M.D.

Judging from the description you give of the trouble, we should put it down, either to the carbureter, or to the manifold, and probably it is more apt to be the latter. See if there is a leak in the manifold where it enters the first cylinder, or any other reason why that cylinder does not get the same amount, or the same quality of fuel as does No. 2, which runs satisfactorily. Irregular working of this nature is most often traceable to the fuel supply.

WANTED: AN IMITATION RADIATOR FRONT.

Editor THE AUTOMOBILE:

[1,268.]—Will you kindly let me know where I can buy an imitation front part of hood to represent a water-cooled machine? I am repairing an air-cooled hood and want the front piece to hide the motor and represent a water-cooled machine. New York.

JOHN A. WESER.

If you will look through our columns you will find the announcements of makers of such parts, or if this letter comes to their attention we will be pleased to forward any information they care to supply.

REGARDING VERTICAL AIR-COOLED MOTORS.

Editor THE AUTOMOBILE:

[1,269.]—Please tell me the name of a four-cylinder, vertical, air-cooled car that has a forced down draft pipe to each cylinder? Also please give me the name of some four-cylinder, vertical, air-cooled cars other than the Corbin. Rockdale, Tex.

PRESTON H. PERRY.

This is the Frayer-Miller.

The Franklin, Knox, Aerocar, Cameron, Marmon, Logan. Probably there are others that we do not happen to call to mind at the moment.

DEVELOPMENT OF THE AUTOMOBILE.

Editor THE AUTOMOBILE:

[1,270.]—Could you give me the name of a book on the subject of "advance in automobile construction?" I would like to get a book that describes the old makes of machines and their inventors, as I have been asked to write on the subject. Plymouth, Ind.

FRED. H. KUHN, JR.

Probably Homan's "Self-propelled Vehicles" will give you what you want in this connection.

INFORMATION ON FRICTION SUPPLIES WANTED.

Editor THE AUTOMOBILE:

[1,271.]—Will you please send me addresses of firms where I can obtain friction paper, strawboard, etc., suitable for fillers of friction wheels? Kenesaw, Neb.

C. G. SCHLEGEL.

Will some advertiser or subscriber please come to the assistance of Mr. Schlegel by furnishing the information desired?

ANOTHER IDEAL "CAR OF THE FUTURE."

Editor THE AUTOMOBILE:

[1,272.]—Being a subscriber of your most valuable paper and interested in former articles appearing in the same on the subject of the "Car of the Future," would like to give my ideas along the same line. Having been in the automobile business from almost the beginning, builder of one car in the earlier days, and also an old bicycle man, I thought my article would probably interest some of your readers, to a certain degree anyway. The specifications of my ideal or "car of the future" are as follows:

Axle.—(Rear.) Live, and of the full floating type. Annular bearings throughout; (front) I-beam section, ball bearing, steering knuckles, roller bearings in front wheels.

Frame.—Ashwood, selected, reinforced with steel radius rods, etc., nickel steel.

Springs.—Full elliptic, 40 inches long, clipped. Front and rear the same.

Wheels.—34-inch, selected, white hickory, artillery pattern.

Tires.—34 inches by 4 inches front and rear, on detachable rims.

Brakes.—Double-acting on transmission shaft, operated by foot pedal. Two double-acting, one on each rear hub, operated by hand lever.

Tank Capacity.—14 gallons gasoline; 1 gallon lubricating oil.
 Tread.—56 inches.
 Wheelbase.—100 inches.
 Motor.—Two-cycle, four-cylinder, 3 3/4 by 3 3/4 inches, having only nine moving parts, four pistons, four connecting rods, one crankshaft.
 Cooling.—Air, copper radiating flanges on cylinders, etc., fly-wheel suction fan in rear.
 Lubrication.—Oiler, gear driven from crankshaft.
 Carburetor.—Float feed, auxiliary air inlet, needle valve, adjustable from the seat.
 Ignition.—Atwater-Kent system, with dry batteries.
 Spark Plugs.—Glass base.
 Control.—Spark and throttle levers on top of steering post; also foot accelerator.
 Starter.—Cylinder primer located on dash, so as to start from the seat.
 Transmission.—Selective sliding, three forward and reverse, ball bearing.
 Clutch.—Expanding ring.
 Drive.—Nickel steel shaft.
 Muffler.—As nearly silent as consistent with back pressure.
 Steering.—Wheel irreversible.
 Lighter.—Electric lamp lighter to light gas lights from seat.
 Body.—Aluminum, side entrance, running boards, divided front seats, seating five persons.
 Hood.—Aluminum, circular shape, instantly removable.
 Weight.—2,000 pounds, scale weight.
 Equipment.—Two oil side lamps, 2 by 8 inches, short focus lens, mirror headlights, set on car even with top of hood or a little higher; good horn, with screen; good generator with swinging basket, or gas tank; cravenette top; folding glass front; full tool equipment, with jack; tires equipped with tire treads, made from chrome leather, thick and heavy, with nickel corrugated rivets in the tread, round headed rivets on the sides to protect tires from ruts; fastened on the tires with steel wire rings through loops in the side of the treads.
 The above car should give excellent service on our American roads, with a minimum amount of expense. The vibration and road shocks should affect the engine and other vital parts so slightly that the repairs should be very light. This car would be very easy on the tires. The long, full elliptic springs will make it very easy riding. This car should be marketed at \$2,250, f.o.b. factory, and would afford a fair profit at that figure.
 Corsicana, Tex. CLARENCE THOMAS.

WILL THE TIRE EXPERTS PLEASE ANSWER ?

Editor THE AUTOMOBILE:

[1,273.]—I have long been a close observer of the pneumatic tire problem, but this is the first time I have ever got up "in meetin'" to air my views. I am not going to bore you with any spring wheel or other fantastic and revolutionary cure-all for tire troubles on the pleasure automobile, as experience with the types in daily use, extending over several years, has convinced me beyond a doubt that there is only one tire, and that is the pneumatic. It is like gold—entirely in a class by itself, but just as we have "near-gold" and "like-gold," we have lots of "near" pneumatic tires, some of which look all right, but the majority of which are neither one thing nor the other, while all are merely more or less recent newcomers to the "just-as-good" class of substitutes.

However, what I would like to obtain some definite information on is the matter of the heating action of the pneumatic tire. It is a matter of common knowledge that running even a comparatively short distance at high speed generates a great amount of heat in a tire—so great that the bare hand cannot be borne on the shoe of the tire, even for a moment, and water thrown on the tires is partially converted into steam. A little consideration shows that there are several sources of this heat. Starting from the outside, these are: First, the friction between the shoe of the tire and the road, and probably this is much greater than is generally imagined; second, heat due to the side bending of the shoe and the working of its various piles, one upon another, this doubtless not being very great, as otherwise the tire would be apt to disintegrate very much sooner than experience shows to be the case; third, the friction between the inner tube and the fabric lining of the shoe, this doubtless also being a matter of minor importance, as if there were much relative movement between the two, the valve stem would soon be damaged; fourth, the continuous compression and expansion of the air in the tube, which is already under considerable pressure. If we have a five-inch tire inflated to 100 pounds to the square inch, this being the pressure to which it is subjected under the load of the car and passengers when standing, it must be evident that every blow which the tire receives in meeting obstructions, dropping into gullies and in otherwise overcoming obstacles, causes a reduction of its interior volume and a consequent rise in the pressure which is accompanied by the generation of heat. The causes of this super-compression, so to speak, follow one another with such

great rapidity when the car is running at high speed that the attendant expansion has but a slight cooling effect.

What I would like to find out is, whether the outside friction with the road, or this super-compression of the contained air, is responsible for the major portion of the heat generated in the tire, and if the latter be the chief cause, would it be of any benefit to interpose a heat-insulating substance between the inner tube and shoe, so as to confine the heat to the former? PNEUMATICS.

CRITICISES DR. HARD'S IDEA OF COASTING.

Editor THE AUTOMOBILE:

[1,274.]—Dr. Hard, in his letter No. 1,229, seems to have a very hard time to tell whether the motor is pulling his car or the car pulling the motor, and if he is going up hill it is a question with him if it is advisable to use the high speed to gain power or the low speed. Compression is also a doubtful quantity with him. I quote, "when an automobile weighing 2,000 pounds descends a 25 per cent. grade, it is propelled by the force of gravity equal to one-fourth of its weight, plus the propelling force of its motor. The retarding forces to be overcome are total friction, air resistance, and the resistances to be overcome before the motor car delivers power. If the motor is turned by force applied to the drive wheels, these resistances remain constant, just the same as if the explosions overcame them. The faster the drive wheels turn the motor, the greater will be the resistance to be overcome and the slower the car will move. We will get the greatest service by using high gear with the spark throttle closed. Therefore, to coast down hill using the motor as a retarder, we should have a convenient circuit breaker and use the speed gear that gives the required resistance for steep hills, and intermediate or low for hills of less grade."

After all, the study of medicine does not make a man a mechanic. If the M.D. was to apply his medical skill to his patients as his letter would indicate he does his mechanical skill to his machine, his would be a good place for an undertaker.

Minneapolis, Minn.

JESSE JENNINGS.

COMMENDING THE HAZLETON STEAMER.

Editor THE AUTOMOBILE:

[1,275.]—The letter by W. Hazleton on his steel-tired steamer was very interesting to me. We see little enough about steam automobiles in the papers these days, and this seems strange, because there are plenty of steam enthusiasts on deck, and the subject seems worthy of more attention.

The use of coal in an automobile has never, to my knowledge, been attempted, at least in a pleasure vehicle, and while this would result in economy it seems to me that this is not the place for coal. In regard to the evaporating capacity, Mr. Hazleton does not state whether this is based on evaporation alone from and at 212 degrees, or whether he means evaporating water as at the temperature fed to the boiler into steam, under the conditions which it leaves. If the latter, his boiler must have an efficiency of about 90 per cent., which would be very remarkable.

I think that Mr. Hazleton is mistaken in his statement that one pound of kerosene will evaporate 25 pounds of water. There is no question, however, but what the Hazleton type of boiler is very efficient and has great capacity.

New York.

GEO. F. WOOLSTON.

BEST ROUTE FROM SPRINGFIELD TO ALBANY.

Editor THE AUTOMOBILE:

[1,276.]—Answering inquiry No. 1,214 for best route from Springfield to Albany: Via Westfield, Huntington, over "Jacob's Ladder," which, by the way, is only play for a good car, through East Lee, leaving State road just beyond at fork, direct to Stockbridge. Continue through West Stockbridge, State Line, East Chatham, Old Chatham, Malden Bridge, Nassau, Schodack Center (slow down for Judge Van Ness), Albany, 92 miles. Have made nineteen trips over this route, and find it the best. The direct Pittsburg-Albany road will be torn up this summer.

Albany, N. Y.

C. S. RANSOM.

WHO CAN HELP OUT ON THIS?

Editor THE AUTOMOBILE:

[1,277.]—Last summer I drove a Ford runabout with which I repeatedly had the same trouble complained of by F. R. Zeigler in letter 1,217 of your issue of March 12, 1908. I note your reply to his query, but am very confident that in the case of the car to which I refer, the difficulty was not due to alteration of the needle adjustment by jolting or otherwise, while the car was running.

It may be that some others of your readers have had this same trouble and have succeeded in remedying it. If so, I trust one of them will be good enough to communicate with you on the subject.

New York City.

D.

INDIANA'S AUTOING WEEK IS IN SUCCESSFUL PROGRESS

INDIANAPOLIS, IND., March 25.—The second annual automobile show given by local dealers and manufacturers opened Monday. The largest automobile parade the city has ever seen took place to-day. The number of automobiles in line exceeded expectations, and a successful week is anticipated. There were four sections to the parade, which was headed by C. W. Newby, grand marshal, followed by Mayor Charles A. Bookwalter, members of the board of works, board of safety, the police automobiles and the Indianapolis military band riding on a big five-ton truck.

Following came one model each of the different cars handled by local dealers, each car bearing a card of uniform size with the name of the car, its price and the name and address of the dealer handling it in Indianapolis. The commercial vehicle section was a special feature, with trucks and delivery wagons ranging from a little Waltham-Orient to a big five-ton Pope-Waverly. Following this came scores of automobile owners, including individuals and clubs from all parts of Indiana.

Tuesday morning at 11 o'clock the hill-climbing contest was held at Michigan Hill, northeast of the city, and there were fifty contestants, including a special event for motor trucks and delivery wagons.

The obstacle race will be held Thursday afternoon on Capitol Avenue boulevard. The week closes with a dinner at the Grand Hotel Saturday night.

In order to carry out the events of the week successfully, the Indianapolis Automobile Trade Association was organized and incorporated last week, as a voluntary association, without capital stock. Frank Staley, of the H. T. Hearsey Vehicle Company, was elected president; A. E. Vinton, of the G & J Tire Company, vice-president; P. D. Stubbs, local representative of the American Motor Car Sales Company, and secretary of the Overland Automobile Company, secretary; Frank L. Moore, of the Fisher Automobile Company, treasurer, and B. W. Twyman, of the Gibson Automobile Company, Charles R. Newby, manager of the Capital Auto Company, R. H. Losey, of the Buick-Losey Company, D. B. Sullivan, of the D. B. Sullivan Auto Company, and Paul Smith, of the Indianapolis Motor Car Company, directors.

Each dealer will exhibit in his own garage during the week. Several automobile manufacturers from over the State have obtained space in different parts of the city in which to exhibit their cars, and the accessory dealers will show their goods in the hotels.

BOSTON'S SHOW STARTED BOOM IN LOCAL TRADE

BOSTON, March 23.—That the much talked about success of the Boston show and the heavy business reported was not all due to imaginations unduly excited by the predominating red in the show building decorations has been indicated since the show was closed, and the exhibitors have been in the quieter atmosphere of their salesrooms. Instead of the reaction which commonly follows show week, and which leads the exhibitors, after footing up their expenses, to say that a show is an interruption of business and costs as much as it comes to, the Boston dealers are enthusiastic over the results which were obtained, and they are producing bunches of signed contracts and long lists of people to be followed up, which they obtained during the week in Mechanics' Building. It is estimated that \$500,000 worth of cars were sold, but these actual sales are as nothing to the business that was started and which the dealers expect to close within the next few weeks.

Very conclusive evidence that the show started a boom in the local trade may be obtained at the automobile department of the State Highway Commission. The week previous to the

show only 314 automobiles were registered, show week the total was 438, while during the week following the show the registrations reached a total of approximately 600 cars. Motor cycle registrations also took a jump. This increase shows only a part of the effect of the show, for many of the cars that were purchased, probably the larger part, will not be delivered for several weeks. During show week, sixteen new dealers were registered, and the past week eight more have taken out certificates. Since the first of January, when the law required that all motor vehicles should be registered, the Highway Commission has issued about 6,900 certificates for automobiles, 300 for motor cycles and 275 for dealers. Only 346 new private operators' licenses have been issued, but it was unnecessary to take out new licenses of this sort as the old ones held over. There have been issued since the first of January 231 new chauffeurs' licenses, and 460 have been renewed. Up to the middle of the month, when the returns from the automobile department were last tabulated, the commission had taken in more than \$40,000 from this source.

NEW HAVEN'S SHOW PROVES SUCCESSFUL.

NEW HAVEN, CONN., March 25.—The largest automobile show ever held in this State was brought to a most successful close here to-night. The New Haven Automobile show opened a week ago last Wednesday night. Mayor Martin, of this city, President Fuller, of the Connecticut State Automobile Association, and Montague Roberts, who piloted the Thomas car the first leg of the New York-Paris race, were present. The exhibition was held in Music Hall, the largest auditorium in the city, which was beautifully decorated, the decorations including several novel electrical effects. Every auto dealer and agency in the entire city was represented at the show, there being a complete accessories exhibit in the basement of the building.

Aside from the big show, there was an annex exhibit of Maxwell and Stoddard-Dayton cars in a building only two doors from the main show.

The Yale Automobile Club successfully held its first annual banquet last Wednesday night at the University Club.

DELAWARE TO HAVE ROAD SIGN BOARDS.

WILMINGTON, DEL., March 23.—Recently it was announced that the Delaware Automobile Association had decided to have sign boards placed at the road intersections in New Castle county, and now comes the announcement that the work will be done by the county, at the suggestion of Road Engineer James Wilson, who will supervise the project. In order to work in harmony in its efforts to insure the enforcement of the automobile law, the executive committee of the Delaware association has had a conference with the police commissioners.

AUTOISTS ENDORSE GOOD ROADS ADVOCATE.

MILWAUKEE, WIS., March 23.—That the good roads question is liable to become a political issue in Wisconsin was demonstrated last week, when a number of Janesville autoists endorsed J. B. Brown for the State Senate. Brown will make good roads his whole platform, and, judging from reports from that place, he will have a walkover.

FARMAN ECLIPSES ALL FLYING RECORDS.

PARIS, March 21.—Before a large gathering at the parade grounds of Issy-les-Moulineaux, Henry Farman to-day successfully accomplished the greatest feat that has ever been achieved in aeronautics. He made a continuous circular flight of two and a half kilometers, or about two miles, in 3:21, which is at the rate of 38 miles an hour. At least half of this time he sailed directly into the teeth of a stiff breeze, and that the latter did not perceptibly diminish the machine's speed is considered Farman's greatest triumph. The machine was of the heavier-than-air type of his own invention, and rose from the ground like a bird, without the slightest hitch, then circling around under perfect control at a height of about 30 feet. The course followed measured a mile, but the distance actually covered was easily twice this, as the inventor caused the machine to make long swerves one way and the other to show under what perfect control it was.

Yesterday Farman made a flight of two kilometers at a greater height and is confident that, within a year, machines will be made capable of flying fully 12 miles without coming to the ground. He also predicts that the sport will never become general, as it is not only costly, and real flying is too hard to learn.

Following his record-breaking performance, Farman accepted an invitation from Leon De La Grange to enter his machine, with which the latter had been making successful short flights throughout the day. De la Grange sent the machine over the ground at the rate of 30 miles an hour and then went into the air, succeeding in making a short flight. This is the first time on record that two persons have been aloft in an aeroplane of the heavier-than-air type.

INTEREST ACTIVE IN BALLOON CUP RACE.

PARIS, March 21.—A. B. Lambert, secretary of the Aero Club of St. Louis, is here, his chief object being to awaken interest in the aeronautical contests to take place at St. Louis next Fall, when the club will distribute \$35,000 in prizes. He is also reported as stating that the St. Louis club is anxious to take over the International cup race again in the event that the German club is not able to make the necessary arrangements. The French club announces that there are so many desirous of representing France in this event that the choice of three contestants to go to Germany has had to be deferred. The club has recently received a concession of a large plot of ground at the Issy-les-Moulineaux parade and will shortly erect ten sheds for aeroplanes. The Spanish Aero Club has arranged an elaborate program for the season and will start it with a long-distance balloon flight, which will start from Barcelona on May 17. The prizes are 9,000, 4,000 and 1,500 pesetas for the first, second and third arrivals, respectively.

CORRECTING THE STEARNS' 1908 DESCRIPTION.

In publishing a detailed description of the Stearns car for 1908, which appeared in the March 19 issue of THE AUTOMOBILE, on pages 401 and 402, a half-tone illustration foreign to the car was inadvertently inserted on page 402, and captioned "Bronze to Steel Emergency Brake and Its Housing." As a matter of fact, this was a photographic view of the new Le Moon rear wheel clutch, designed to do away with the differential, and its appearance in connection with the Stearns car was entirely out of place.

L. E. FRENCH TO EDIT A. S. M. E. PUBLICATIONS.

The American Society of Mechanical Engineers is to be congratulated upon the acquisition of Lester E. French to head its editorial department. Mr. French has had a long technical and newspaper experience, having been for nine years past editor-in-chief of *Machinery*, besides having compiled numerous textbooks on technical subjects. So many improvements are planned in the society's editorial work that no progressive engineer can afford to miss its various publications.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- Apr. 4-11.....—Pittsburgh, Pa., Duquesne Garden, Annual Show. Automobile Clubs of Pittsburgh. Thomas I. Cochran, manager.
Apr. 5-12.....—Montreal, Canada, Arena, Third Annual Automobile and Sportsman's Show. R. M. Jaffray, Mgr.
Apr. 6-8.....—Denver, Mammoth Rink, Annual Automobile Show. G. A. Wahlgreen, manager.
Apr. 16-18.....—Memphis, Tenn., Automobile Show, Memphis Automobile Dealers' Association. William Bruce, secretary.

Race Meets, Hill Climbs, Etc.

- Apr. 6-10.....—New York City, Automobile Carnival, Illuminated Parade, Hill Climb, etc., New York Automobile Trade Association.
Apr. 24.....—Briarcliff Trophy Race, Westchester County, N. Y. Robert L. Morrell, chairman.
May 4-5.....—Harrisburg-Philadelphia and Return, 300-mile Endurance Run, Motor Club of Harrisburg.
May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
May 16.....—Hartford, Conn., 200-mile Endurance Run, Automobile Club of Hartford.
May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
July 6-8.....—Buffalo, National Convention of the A. A. A., and Start of Fifth Annual A. A. A. Tour.
Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- Mar. 26-April 4.—London, Olympia Industrial Vehicle and Motor Boat Show.
Mar. 28-April 6.—Paris, Alcazar d'Ete, Small Inventors' Exhibition.
May 17-31.....—Austria, Budapest Automobile Show.
May 17-June 2.—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- April 1-13.....—Monaco Motor Boat Races and Motor Boat Exhibition, International Sporting Club of Monaco.
April 25-May 25—Industrial Vehicle Competition, Automobile Club of France.
May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
May 7.....—Sicily, Palermo, Targa Florio Circuit, Voiturette Race, Automobile Club of Italy.
May 11-16.....—Ireland, Irish Reliability Trials.
May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
May 31.....—Russia, St. Petersburg to Moscow Race.
June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
June 14.....—Mount Cenlis Hill Climb, for Voiturettes.
June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club of Germany.
June 15-19.....—Scotland, Scottish Reliability Trials.
July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France).
July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
July 20-30.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.
Sept. 1-8.....—French Voiturette Contest, auspices of "L'Auto."
Sept. 6.....—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.
Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

CALIFORNIANS PREPARING FOR AN ACTIVE AUTOING SEASON

SAN FRANCISCO, CAL., March 20.—For the first time in the history of automobiling on the Coast, an organization devoted to the sport has systematized a schedule of events and has issued a full program for the season, in advance. This is the Automobile Dealers' Association of California, and, judging from the ambitious salc on which it has outlined its program, there should be no dearth of interesting events. The dates and runs are as follows:

Monday, March 29, club run by members and their friends to the summit of Mt. Hamilton and return, leaving San Francisco on the 7 A. M. boat for Oakland, thence southward to San José, stopping at Smith's Creek for luncheon. Then the trip up the mountain and return to San José, going home on either side of the Bay.

Saturday, April 11, hill-climb in or near San Francisco. The cars will be classified as follows: Gasoline runabouts, \$1,500 and under, two passengers; touring cars, \$1,500 and under, four passengers; touring cars, \$2,000 and under, four passengers; runabouts, \$2,000 and under, two passengers; touring cars, \$2,500 and under, five passengers; runabouts, \$3,500 and under, five passengers; free-for-all, gasoline or steam, two or more passengers. The entry fee will be \$20, to be returned if the entrant starts.

Saturday and Sunday, May 30 and 31. Two-day endurance

run round the Bay. First day, by way of Mission road to Uncle Tom's Cabin, round Spring Valley water works' lakes, to Half-Moon Bay, to San Gregorio, La Honda, Redwood City, by way of the Summit to Mountain View, to Los Gatos by way of the Saratoga road, and to San José. Second day, to Mission San José, through Livermore, Concord and Walnut Creek, over the Fish Ranch grade to Berkeley and finish at Oakland.

Saturday, July 4. Two days' trip through Marin, Sonoma and Napa counties. This event may be postponed, should the Automobile Club of California plan one for the same time.

Sunday, and three days following, September 6, 7, 8 and 9. This stretch covers two holidays, Labor Day and Admission Day, and may be utilized for an extended endurance run to Los Angeles. Nelson's record for the distance of 520 miles is 18 hours 13 minutes, but 48 hours will be allowed for the run each way, with a day's rest at Los Angeles.

As a curtain raiser to the program the association, through its Runs and Tours Committee, will welcome the contestants in the New York-Paris run to the Golden Gate. A. B. Watson, chairman of the committee, will head a delegation that will go south as far as San José, and will assume the duties of piloting them to San Francisco, this task having been undertaken by the Santa Clara Automobile Club as far as San José. The local club is preparing to make a great deal of the event.

A. M. C. M. A. NAMES ITS COMMITTEES FOR 1908

COMMITTEES for 1908 were announced last week by Benjamin Briscoe, chairman of the committee of management of the American Motor Car Manufacturers' Association. There are few changes in the committees over last year. The show committee, which is always an active one, will again have H. O. Smith, president of the Premier Motor Manufacturing Company, as its chairman. Associated with him will be S. H. Mora, of the Mora Motor Car Company, and R. M. Owen, of the Reo Motor Car Company. The following are the committees in full:

Show.—H. O. Smith, Premier Motor Mfg. Co., chairman; S. H. Mora, Mora Motor Car Co.; R. M. Owen, Reo Motor Car Co.

Tours and Races.—W. C. Marmon, Nordyke & Marmon Co., chairman; H. O. Smith, Premier Motor Mfg. Co.; A. C. Newby, National Motor Vehicle Co.

Good Roads.—Chas. E. Lewis, Jackson Automobile Co., chairman; James Couzens, Ford Motor Co.; R. E. Olds, Reo Motor Car Co.; H. B. Krenning, Dorris Motor Car Co.

Legislation.—R. E. Olds, Reo Motor Car Co., chairman; C. G. Stoddard, Dayton Motor Car Co.; A. C. Newby, National Motor Vehicle Co.; R. A. Palmer, Motorcar Co.; R. E. Graham, Acme Motor Car Co.

Advertising and Publicity.—Barney F. Everitt, Wayne Automobile Co., chairman; Harry Fosdick, Moon Motor Car Co.; G. B. Louder-

back, Buckeye Mfg. Co.; Theo. P. Bailey, St. Louis Car Co.; Leon Myron Bradley, New York office; Charles E. Duryea, New York office.

Membership.—W. H. VanDervoort, Moline Automobile Co., chairman; Morris Grabowsky, Rapid Motor Vehicle Co.; R. E. Burroughs, Abendroth & Root Mfg. Co.

Finance.—James Couzens, Ford Motor Co., chairman; W. G. Morse, Atlas Motor Car Co.; J. B. Bartholomew, The Bartholomew Co.

Standardization and Technical.—John D. Maxwell, Maxwell-Briscoe Motor Co., chairman; Henry Ford, Ford Motor Co.; R. S. Crawford, Crawford Automobile Co.; L. P. Mooers, Moon Motor Car Co.; R. E. Olds, Reo Motor Car Co.

Freight and Transportation.—Harry Knox, Atlas Motor Car Co., chairman; H. W. Mack, Mack Bros. Motor Car Co.; R. Harry Croninger, Pennsylvania Auto-Motor Co.; J. N. Willys, Overland Auto Co.; G. D. Wilcox, Gearless Transmission Co.; C. C. Hanch, Nordyke & Marmon Co.

Tires.—G. V. Rogers, Mitchell Motor Car Co., chairman; James Couzens, Ford Motor Co.; Frank Briscoe, Brush Runabout Co.; O. Stevenson, York Motor Car Co.

Agencies.—W. H. VanDervoort, Moline Automobile Co., chairman; A. R. Welch, Welch Motor Car Co.; H. S. Leyman, DeLuxe Motor Car Co.; Frank L. Pierce, Gaeth Automobile Co.; H. B. Larzelere, Chadwick Engineering Works.

NEW JERSEY'S AUTO AGENTS BEGIN ATTACK ON POLITICIANS

NEWARK, N. J., March 23.—That no stone is to be left unturned to rout the politicians who have been making auto legislation to suit themselves is evident from the first move in the campaign undertaken by the New Jersey Automobile and Motor Club and the New Jersey Automobile Trade Association, who are acting in conjunction. To demonstrate to the public the value of the automobile industry to the State of New Jersey, the Trade Association is sending broadcast to manufacturers a request to state from what makers in Jersey they buy parts of various kinds. The circular letter is signed by Secretary Ellis and President Paddock, of the association, and outlines the reasons for this particular move. It is, in part, as follows:

"Our politicians are blind to the extent to which our State is benefited by the automobile and the great number of people who

depend on it for a livelihood, for the reason that they do not see a complete car made here, but the fact is that New Jersey, more than any other state, benefits by the automobile.

"1.—From the fact that almost every part entering into its construction is made by our factories, including forgings, castings, bearings, springs, tires, lamps, bodies, varnish, leather, paint, electrical appliances, wire, tools, jacks, machinery, wheels, axles, gas tanks, trunks, radiators, gears, etc.

"2.—The peculiar location of our State makes it most attractive for tourists, and great amounts of money are annually left with our hotels, summer resorts, garages and merchants generally, and the automobile has immeasurably benefitted the real estate business and brought more desirable residents to the State than anything except the railroads.

"We are going to fight and fight hard. We will make it a paramount political issue with us and will look to parties rather than to persons for results."

ADVANCE OF THE CARRIAGE-MAKERS' ART.

Ever since the time, three or four years ago, when the carriage-maker first awoke with a start to the possibilities of the automobile and its future, there has been a keen rivalry on the part of different makers to see who could bring forth the most artistic and completely furnished closed body. As a result, many closed cars have come to represent a standard of

Interior Finish of Franklin Coupé.

taste and equipment far in advance of anything that had been thought possible in connection with body-building on the horse-drawn vehicle. A good example of this refinement of interior finish that forms one of the striking developments of the industry during the past few years, is represented by the accompanying photograph of a special four-passenger Franklin coupé. This is finished in striped buff, French whipcord with lace to match, the broad lace around the door and front edge of the seats being designed especially to harmonize with the whipcord cloth. Quite a unique effect has been produced by lining the ceiling of the car, which carries a neat dome electric light, with the same pattern of cloth used on the remainder of the interior. The curtains are of light brown French silk and the carpet of French wilton, all harmonizing in the general buff color scheme, which is extended even to include the handles, these being made of brownish-yellow horn. The windows are all arranged to drop in pockets, and have frames of polished mahogany. The car is very roomy, and is said to be one of the best of its kind ever turned out by the Franklin Company, which has only turned its attention to the closed vehicle within the past two years.

NEW MODEL LOCOMOBILE ON VIEW.

One of the new models unveiled at the recent Boston show is the Locomobile roadster shown by the accompanying photograph. The chassis resembles the Locomobile, "Type 40," in most particulars, but the springs have been made lighter, owing to the reduced weight of the body employed, while the low seats give the car a lower appearance than it ordinarily has.

The designers have taken particular pains to secure a combination of style, conservatism and comfort, as it has been noticeable that many cars of this type are extremes,

First Roadster Type of the Locomobile Turned Out from the Bridgeport Factory.

some even having the driver's seat almost over the rear axle, so that the seats are far from comfortable.

In this Locomobile "40 runabout" the seats are large and comfortable, and the seating capacity is variable, the two rear seats being placed on an artillery tool box. One of these seats may be removed, and the other placed on the center of the box, thus making it a three-seated car, or both of these seats may be removed. There is ample space between the box and the back of the front seats to carry a good-sized trunk or hamper, or the box itself may be removed, leaving the platform free. Some of these cars have already been placed, and the makers are planning for April deliveries.

STRIVING FOR RAMBLER CLUB PRESIDENCY.

KENOSHA, WIS., March 23.—Competition is keen for the presidency of the recently formed Rambler Fifteen Thousand Mile Club, every member of which must have covered at least 15,000 miles in a Rambler car. Major Edwin S. Muir, of the city of Winona, Minn., a formidable candidate for presidency, has a record of 20,000 miles from one Rambler car, 18,000 from another, and 6,000 from a third. Joseph I. Bennett, Boston, is a strong second with 19,000 miles from one car, the first 5,000 of which were traveled with an expenditure of but 85 cents for repairs. From the letters received from owners desiring membership in the club, it is shown that the average cost is a little more than two cents a mile, many owners having run forty to fifty thousand miles at a cost of less than \$200, exclusive of tires. Oil and gasoline averages one cent a mile, and repairs make up the remainder. Thomas B. Jeffery & Company offer a handsome watch fob as a membership token and as an incentive to owners to send in facts about the cost of keeping their cars. One hundred members are now enrolled in twenty-six different States. According to recent registration returns, 10 per cent. of the 2,211 automobiles in Nebraska are Ramblers; Illinois possesses 738 Ramblers out of a total of 9,799 cars, and Wisconsin claims 477 cars from the Thomas B. Jeffery factory among the 3,852 in daily use in that State.

ENTRY BLANKS READY FOR HARRISBURG RUN.

HARRISBURG, PA., March 23.—Rules for the second annual endurance run of the Motor Club of Harrisburg, to be held May 4-5, were issued to-day. This year's run will be over 300 miles in length, and will have the night control established at Philadelphia. On the first day, 168 miles will be traversed by the contestants via Lebanon, Reading, Allentown, Easton, Doylestown to Philadelphia. On the return trip, the mileage will be 145 miles, via Norristown, Reading, Lancaster, Columbia, Marietta, Mount Joy to Harrisburg.

There will be four classes in the run, as follows: Class A, for touring cars costing \$2,250 and over; Class B, for touring cars costing less than \$2,250; Class C, for runabouts costing \$2,000 and over; Class D, for runabouts costing less than \$2,000. Handsome silver loving cups will be awarded as prizes in each class to the winning cars.

ELIMINATING THE DIFFERENTIAL.

Ever since automobiles have come into practical use, attempts have been made to do away with the balance gear, or differential, which has been found necessary to enable the car to take turns and to save the wear on the tire of the wheel which takes the inside of the curve. One of the latest of these is known as the Le Moon axle, the chief feature of which is that it transmits the

power through the slow-turning wheel alone when rounding a curve. It consists of a special form of automatic clutch applied to each rear wheel, one of these clutches being illustrated in elevation and section by the accompanying illustration.

These clutches consist of a spider *B* keyed to the drive-shaft *A* of the axle. The end of each star piece carries a roller *C*, which bears upon an arc segment *C* of an expander *D*, which expander is forced outwards against the drum *F* on the rear wheel, thereby locking the axle *A* to the road wheel. The expander *D* is made in three sections, with springs *E* separating them, these springs serving to disengage when the clutch releases. The spoke of the wheel is designated *W*, and the wheel, loose on the driveshaft *A*, is only connected thereto when the expander *D* engages with the drum *F*. The drive-shaft *A* extends from end to end of each axle and carries

Elevation and Sectional Views of Le Moon Clutch In Place.

a spider *B* on each end. Whether going straight or turning corners the axle and both spiders revolve at the same speed. When driving on the straightaway, the rollers *C* in their efforts to revolve, attempt to climb the curvature of the arc of the expander *D*, thereby expanding *D* and locking it to the wheel and rotating it. Should a corner have to be turned, the outer wheel is compelled to travel faster than the spider *B*, and so runs away, as it were, with the expander *D* until the rollers *C* are in the middle of the arc, at which point there is no engagement between the clutch *D* and the drum *F*, and then the inside wheel is carrying the car around the corner. When the corner is rounded and the road wheels run at the same speed, the clutch operates and the drive through both wheels is resumed. The claim that this device reduces skidding is based on the fact that the inner wheel drives when turning the corner.

According to the inventor, Mr. Le Moon, where a car starts turning to the left, if the outer wheel does the driving, its tendency is to keep moving in a straight line, irrespective of the turn made by the front wheels, and this tendency to drive in a straight course, results in the skidding. When the inner wheel drives, it also tends to follow the straight line or direction the car was following before the turn, but the direction of its effort is practically through the center of the car. Inventor Le Moon attaches great importance to this feature and claims remarkable freedom from slipping on cars equipped with his clutches. Dr. J. R. Pennington, 103 State street, Chicago, who is exploiting the merits of the invention, claims to have given some most satisfactory exhibitions of its work, and is confident that the Le Moon can be employed most satisfactorily as a substitute for the differential balance gear now universally employed. This would tend to both simplify and strengthen rear-axle construction to a very great extent.

PACKARD NEGOTIATING FOR E. V. CO. PLANT.

HARTFORD, CONN., March 23.—Though none of the terms of the deal are forthcoming, nor is it definitely settled that it will be consummated, it is known that the Packard Company is negotiating for the purchase of the Electric Vehicle Company's plant in this city. This much the officials representing the Packard interests, H. B. Joy and M. J. Budlong, are willing to admit. The hopelessly entangled condition of the defunct company's affairs is given as the reason for the delay that is bound to ensue before it will be announced definitely whether the plant will be taken over or not. In the meantime, it is currently reported that the purchase has practically been completed and that the only thing remaining is to settle the details.

It is rumored that M. J. Budlong, formerly president of the Electric Vehicle Company, will take charge of the Hartford works when they pass under Packard control, and that the plant will be used for the manufacture of commercial cars and taxicabs. What will become of the Selden patent, and whether it is included in the sale as an asset, is a matter for much speculation. It still has four years to run and, should it be upheld by the courts, its value will be tremendous.

TWO STUDEBAKERS FOR THE A. A. A. TOUR.

It has been formally announced by C. F. Reddin, of the Studebaker Bros. Company, New York City, that at least two Studebaker cars will be entered in the A. A. A. Glidden tour. "The consensus of opinion," says Mr. Reddin, "seems to favor an endurance test of some kind, and the Glidden tour is, perhaps, the most satisfactory solution of the problem. Unquestionably, some of the faults which developed in the rules of the 1906-07 tours will, from experience, be eliminated in the tour of the coming season. Whatever the rules are, it is now my intention to enter at least two of our cars, and I feel certain that they will make as good a showing as they have in every contest in which we have entered."

AMERICAN TAXICABS BECOMING NUMEROUS.

Interest in the solution of the cab problem on the part of American manufacturers is growing apace to judge from the number of new cars designed for this service that are making their appearance on the market. The latest of these to be brought out is the Oakland, of which a photograph is shown here. It is being produced by the Oakland Motor Car Company, of Pontiac, Mich., and is the work of Alanson B. Brush. It is the first of its kind to be placed on the market at such a low price, as it lists at \$1,850 in complete running order, as shown. It is of extremely light, yet stanch, construction and has been designed particularly with a view to economical running and maintenance; in other words, as a dividend-carner.

Attractive Lines of the New Oakland Taxicab.

HOWARD NOW MARKETS ASSEMBLED CAR.

Since adopting its plan of selling the complete parts for six-cylinder and four-cylinder cars, which was described in these columns some time ago, the Howard Motor Works, Yonkers, N. Y., find that there are a great many prospective purchasers who doubt whether the assemblage of parts thus supplied "will go together or not." They have accordingly decided to modify their plan of marketing these materials to the extent of giving

Complete Assembly of Howard Six-cylinder Parts.

the purchaser the option of taking the car in pieces, or completely assembled and ready for the body as shown in the accompanying illustration, which shows one of the six-cylinder type. These cars are equipped with the well-known Howard four- and six-cylinder, four-cycle, vertical, water-cooled motors, which are designed and constructed according to the best engineering standards. They are equipped throughout with the best grade of accessories, such as the Hill Precision oiler, and have numerous special features of construction, such as the Delahaye type of slip joint on both the water piping and inlet manifold.

The clutch is of the conical type, with cork inserts and the change speed gear provides three forward speeds and reverse on the selective plan of operation, the clutch and gear being inter-connected by means of an ingenious and positive interlocking device which prevents the shifting of the gears until the clutch is disengaged. Final drive is by propeller shaft to a live rear axle. The six-cylinder car is geared 2.5 to 1 on the high speed, while the four-cylinder car is geared 3 to 1. The complete parts of the six-cylinder car, including tires, list at \$1,200, or \$1,500 assembled as shown, while two-seated bodies may be had from \$100 upward. The touring car lists at \$1,100 and \$1,400 respectively and will accommodate a five-passenger touring body.

HUNTING ANTELOPE IN AN AUTOMOBILE.

"Although it is some time ago now, doubtless the story of the antelope hunt which I made in my car last fall will be of considerable interest to you," writes M. L. Woodman, of Lewistown, Mont., to the National Motor Vehicle Company, Indianapolis. "However, I will confine myself to a bare statement of the facts," continues Mr. Woodman, "leaving all literary embellishments to yourselves, that being, if my information is correct, an accomplishment with which every Indianian is gifted.

"Accompanied by an expert chauffeur, Johnny Warner, we left Lewistown, where I reside, about 8 o'clock in the morning of October 10 last, and set out in my National for the foothills of the Belt Mountains, located in Meagher County, Montana. Lying about twenty miles northwest of Harlowtown and sixty-five miles from this city is a spring where I was sure we could find some antelope. The roads were superb and we let her out on the way over, covering the sixty-five miles without even a pause and making the distance in an even two hours. Upon arriving at the spring we drove around for a few minutes until, with the aid of a powerful field glass, I located a bunch of about twenty-

five antelope lying down at a distance of about five miles.

"We headed the machine in that direction and succeeded in getting within one mile of the antelope before they jumped up, ready for the race. The country is of a rolling nature that has been close-cropped by thousands of sheep, so that we could make out all holes and stones some distance ahead. The antelope broke into a run when we were within about three-quarters of a mile of them. We started after them at a moderate pace to get some idea of their speed, gradually creeping up. After following half a mile or so in the rear for a short time, we let the machine out and the way we began to close the gap made it appear as if the animals were standing still. After running about two miles we came within fifty feet of them. Going at a 35-mile an hour rate, I brought down one of them and then took the wheel while Warner handled the gun and brought down another.

"We dressed the antelope, loaded them on the car and started for home, arriving back in Lewistown in the afternoon, having traveled fully 150 miles in the short time we were out. This was my first hunt for big game in an automobile, but it is my intention to repeat the experience next year, having fully convinced myself that my National can easily outrun even an antelope, which is one of the fleetest animals to be found on the plains."

IMPROVED WHEELS FOR PORTABLE TANKS.

Wire wheels not having proved satisfactory on their special portable gasoline tanks, owing to their continually catching on projecting parts of the cars, and wood wheels not being practical, S. F. Bowser & Company, Fort Wayne, Ind., have adopted the indestructible steel wheels made by the Indestructible Steel Wheel Company, 1304 Michigan Boulevard, Chicago. These wheels are very light for their size and are extremely strong. As is the case with the pleasure type for automobile use, the steel stampings are perforated, as will be noted on reference to the accompanying illustration of a Bowser portable tank equipped in this manner. The makers of the indestructible wheel are now perfecting a type for motor-cycle use, which will be placed on the market in the near future, as these wheels are especially adapted for service calling for extreme strength and a minimum weight.

Bowser Garage Tank with Indestructible Steel Wheels.

IMPROVING CARBURETER AIR REGULATION.

Doubtless the question of automatically altering the amount of air supplied to the mixture provided by a carbureter has been by far the most puzzling that the maker of a carbureter has had to contend with. Certain it is that it has been the subject of a greater number of inventions and patents than probably all the other parts of the carbureter put together. One of the most

Sectional Views of the New Goldberg Carbureter.

recent attempts to solve the problem and one that has met with unusual success, is the Goldberg carbureter, made by the Goldberg Motor Car Devices Manufacturing Company, 1253 Michigan avenue, Chicago. It is the result of more than two years' close study of the subject on the part of its inventor, although it has now been on the market but half a year.

The chief features of its design will be apparent from the accompanying sectional illustration, which shows it to be of the float type, the gasoline entering from below at the point *A*, this being a universal type of coupling permitting the end *A*¹ to be turned in any direction. Departing from the usual practice of making the interior of the float chamber a closed book, it has been made of Macbeth glass 1-4 inch thick, which is claimed to be practically unbreakable. This glass chamber rests on combination rubber and cork washers *C*¹, so that by screwing the cover down tightly on its central support it is made perfectly gasoline tight. The needle valve *B* is purposely made of heavy and durable construction. It is operated by the two triangular-shaped levers *C*², formed with toe-pieces resting against a shoulder on the valve and the high heel parts on which the drawn brass float *A*², rests. The valve *B*, is held on its seat by the spring *D*¹.

Another feature in which the Goldberg carbureter differs is in the nozzle, which is not provided with any means of adjustment, but has openings of three different diameters, the largest, *H*¹, being near the top, while one of medium diameter is a short distance above it, this being shown at *H*², and the smallest, *H*³, is in the tip of the nozzle. The exterior of the cone, *H*, bears a definite relation to the conical sides of the chamber *K*, which is such as to produce a strong current of air at low speeds, the auxiliary air inlet meanwhile remaining closed. The gasoline level is 5-16 inch below the top of the cone, or approximately at the bottom of the smallest opening. The mixing chamber is water-jacketed and an unusually large amount of water used, as is indicated by the size of the spaces *J*, thus insuring against condensation even in the coldest weather, while should this occur higher up, as at *M*, the liquid will fall back into the heated zone. The thimble, *F*, at the base of the chamber, regulates the size of the normal air opening, and when starting any overflow from *H* falls into *F* and is there vaporized on the principle of the surface carbureter.

The spring-controlled auxiliary air-valve, *V*, takes care of this essential, which is controlled by a high-speed spring, *S*, and a low-speed spring, *S*¹, the latter giving an opening of 1-64 to 1-32 inch, while the former permits the maximum opening of the valve, one coming into action as the other stops, *S*¹ acting alone on the low speed, the relative tension of these springs hav-

ing been carefully worked out. The Goldberg is made in 1, 1 1-4 and 1 1-2-inch sizes, the various parts being exactly proportioned in each case, so that a carbureter of this make when purchased for a motor of a certain size may be said to be accurately adaptable to it, as if designed expressly with its needs in mind, and with the present demands for greater economy and efficiency this is what is required in every instance.

SIMPLIFYING THE GLASS WINDSHIELD.

One of the most important developments in the design of that essential that few drivers care to be without for any length of time—the windshield—has been the elimination of the array of bolts, nuts and fasteners which had to be manipulated every time an adjustment was necessary. This was a distinguishing feature of the early types of glass windshields, and the culmination of its development toward the other extreme, that of simplicity, is to be found in the new Williams divided windshield, now being placed on the market by the Twentieth Century Motor Car Company, South Bend, Ind. It is so constructed that the top sash can be placed in any one of three positions without touching a nut, thumbscrew or bolt. The operation is accomplished with the aid of a simple locking device, the design of which will be clear at a glance at the accompanying illustration, showing it in longitudinal section.

One of these locking devices is placed at each side of the frame, and by taking hold of them and pulling down and outward, the sash may be moved to any position desired. The forward position leaves a space through which the driver can see the road very plainly, but still serves as a protection against rain and snow, while in summer it acts as a dust and bug shield though giving ample ventilation. The design and construction of the brass frame type of shield made by this firm is shown in the larger illustration. These fittings are machined throughout, all parts being made on jigs and templates, thus making them all interchangeable. On both the brass and the mahogany frames they are assembled with "anti-rattlers," which prevent them from becoming noisy. The wood frames are made in two styles, for touring cars and runabouts. On the brass frame there is not a nut or bolt to hinder cleaning, which will be found a great advantage.

Automatic Hook of Williams Shield.

THINGS DOING AMONG THE GARAGES.

System Essential in Automobile Garage Business.

ROCHESTER, N. Y., March 23.—As many an experimenter has learned to his cost, the automobile garage business, by reason of its many ramifications, is one in which it is easy to lose money. A reliable system of bookkeeping and consistency in carrying it through are in every case essential to success. The United States Automobile Company, of this city, has evolved a system which appears to keep a very close check on all departments and to preclude possibility of waste of time or material.

As far as customers are concerned the charges are the usual ones for live and dead storage. The internal working embodies the use of a time clock for all arrivals and departures of men, cars, liveries, etc. The same system applies to the workshop, where every man must account for each half-hour of his time, besides reporting to the garage foreman if he is employed in the shop. Such general terms as "cleaning up," "shop work," etc., are unknown. For all accessories delivered a signed receipt is demanded, thus obviating any later claim that goods were not delivered. In connection with this is the usual system of receiving goods through a receiving clerk.

Just what it costs each day to run the garage is shown by a special daily form, giving the exact amount paid in and paid out in connection with the establishment. The bookkeeping system comprises about twenty-five different headings, with a debit and credit account for each, thus keeping an absolutely correct distribution of payments and earnings in all the different departments into which a garage business can be divided.

New Jersey's Capital Has a Fine New Garage.

TRENTON, N. J., March 23.—Quite a notable addition to this city's garage facilities—in fact to that of the State of New Jersey—was made last fall in the shape of the new Brock garage, located on Canal street, just off East State street and near the Pennsylvania railroad freight depot. Its owner is John L. Brock, who has had a number of years' experience in the business, and who planned the building throughout with a view to handling the largest number of cars without confusion. The building is of brick construction, two stories high, and measures 80 feet front by 154 feet in depth. The first floor is devoted to storage, making it easy to run cars in and out of the garage at short notice. An independent locker is provided on this floor for each one of the cars stored there. Access to the second floor is by means of an electric elevator which conveys cars to the repair shop and electrical department. Both of the latter are of the most modern type throughout, the repair shop being completely equipped with the latest improved machinery, all of which is motor driven, while the electrical department affords facilities for the charging of a number of cars simultaneously and has a storage capacity for 60 cars. A

special reception room is provided for women, and every provision has been made both for the ready handling of the car, as well as the comfort of the drivers. The establishment represents an outlay of \$25,000 and is reputed to be one of the largest and best equipped of its kind in the State. Mr. Brock is the Trenton representative of several well-known cars, and also carries a full line of accessories. He is a member of the contracting firm of Prior & Brock.

An Imposing New York Up-State Garage.

GLENS FALLS, N. Y., March 23.—Nothing is so strongly indicative of the permanent nature of the automobile business in the smaller cities of upper New York State as the imposing character of the buildings that are being put up within the last year or two for garage purposes, as well as the amount of money that has been spent on facilities for the comfort of the automobile owners who look to these establishments for the storage of their cars, as well as their supplies.

The Miller Brothers Garage, located at 12 Maple street, in this city, forms a typical example of this, and some idea of the size of the establishment may be gained from the accompanying reproduction from a photograph. The building is two stories in height, of fireproof construction throughout, and with its wide front and ample depth affords storage and washing facilities for a large number of cars. The building is devoted exclusively to garage purposes, the office of the proprietors being situated at 7 Bay street. As Glens Falls is located right at the entrance to the Adirondacks and lies between Saratoga and Lake George, the number of tourists that pass through it daily during the season is unusually large, and the demand for garage accommodation and facilities is correspondingly large. This accounts, to a certain extent, for the size of the Miller Brothers' establishment, though there are quite a number of cars of various makes owned by local residents in the city and suburbs.

Delaware City's Garage Facilities Growing.

WILMINGTON, DEL., March 23.—The T. C. Bradford Company, which conducts a large automobile, motorboat, bicycle and general sporting goods establishment at 711 Market street, will shortly undertake the establishment of an up-to-date automobile garage which will represent a welcome addition to the city's facilities in this respect. The large Tanguy stable property, located at Tenth and Tatnall streets, has already been leased for ten years and the work of remodeling the former dwelling place of the equine motor into a modern automobile garage will shortly be undertaken. Every modern facility will be installed and the establishment will be a model of its kind when completed. The lessees will take possession this week.

The Garage that Glens Falls, N. Y., is Proud of.

FORT GEORGE HILL-CLIMB TO BE FROM STANDING START

FOR the first time in the history of events of its class in this country, the Fort George hill-climb, New York City, which will be run off on Thursday, April 9, as one of the features of the auto carnival to be given under the auspices of the New York Automobile Trade Association, will be made from a standing start. This is done for two reasons, probably the chief of which is the danger of a flying start, owing to the obstructions in the shape of the pillars of the elevated structure at that point, and on which one of the contestants came to grief last Summer. It is also a much more severe test of a motor's power and will not be a great disadvantage, as a short run will be available before taking the grade. No alterations on stock cars will be permitted, other than that of gears and the removal of mufflers, tops and windshields.

Since first issuing the program of this event, the hill-climb committee of the association has revised the classification of the different entrants so that they now stand as given below, the chief changes being the addition of two open classes in which steam and gasoline cars may compete together, beside special classes for steam and electric cars. The list of events will be:

- 1.—Gasoline cars selling for \$850, or less.
- 2.—Gasoline cars selling from \$851 to, and including, \$1,250.
- 3.—Gasoline cars selling from \$1,251 to, and including, \$2,000.
- 4.—Gasoline cars selling from \$2,001 to, and including, \$3,000.
- 5.—Steam, gasoline or electric cars selling from \$2,001 to \$3,000.
- 6.—Gasoline cars selling from \$3,000 to, and including, \$4,000.
- 7.—Four-cylinder cars selling for more than \$4,000.
- 8.—Six-cylinder cars selling for more than \$4,000.
- 9.—Free-for-all, open to cars of all motive powers.
- 10.—Open to steam cars only.
- 11.—Open to electric of all types.

Entry fee for each car for each event, \$10.

Early entries for the carnival parade, to be held on the evening of Tuesday, April 7, include 50 Oldsmobiles, 25 Maxwells, 6 Stearns and 6 Studebakers, the other entries already bringing the total over 200, although the blanks have only been out a short time. Several entries of floats have already been made for the dealers' division, prominent among them being one of Jones speedometers and one of P. & H. tires.

The search for the oldest car still in use has brought forth a two-cylinder, six-horsepower Panhard imported in 1898. It will be driven by George Robertson and will be given the post of honor, unless something antedating it should be unearthed in the interim. It has been decided to start the parade at 7:30 in the evening from Broadway and Fifty-seventh street, the route being as already given in THE AUTOMOBILE. The reviewing stand will probably be located on Broadway at or near Eighty-sixth street.

THIRD ANNUAL HILL-CLIMB AT BRIDGEPORT.

BRIDGEPORT, CONN., March 23.—Preparations are well begun for the third annual hill-climb of the Bridgeport Automobile Club, at Sport Hill, Easton, on the morning of May 30. Chairman Ralph M. Sperry, of the contest committee, has obtained permission from the selectmen of Easton to use the road on the hill on the morning of Memorial Day, and during the present week a meeting of the committee will be held and the classes arranged. A. H. Crawford, of New York, who won the Yale cup last year, has expressed his intention of offering a special prize cup. A. L. Riker, of the A. A. A. racing board, has been asked to officiate as referee.

QUAKER CITY M. C. ROADABILITY CONTEST.

PHILADELPHIA, March 23.—On Saturday, April 11, the Quaker City Motor Club will run off the second event of its season's program—a "roadability" contest from Philadelphia to Cape May. The winner will have to be an excellent judge of pace, for drivers will have absolutely nothing to go on except the speedometer. The chief emblem, the handsome \$500 silver Hotel Cape May cup, will go to the car that most nearly approaches the official schedule time figured out for the course by the officials.

Time allowances will be secret, each driver carrying a sealed envelope, which will not be opened until the finish is reached, when the start and finish times will be compared and the relative positions of the contestants figured out. Second and third cars will be awarded certificates of merit, while the drivers will receive medals. The event will be open both to club members and outsiders, the latter "coming up double" on the entrance fee.

POWELL EVANS HEADS A. C. OF PHILADELPHIA.

PHILADELPHIA, March 23.—Powell Evans has been elected president of the Automobile Club of Philadelphia, to serve during the year 1908-09. The other officers elected are: Vice-president, Stedman Bent, and S. Boyer Davis, secretary and counsel. The new board of governors will be made up of Stedman Bent, S. Boyer Davis, George B. Linnard and Isaac Starr, who will serve for one year, and Henry P. Baily, Powell Evans and Jacob J. Seeds, whose terms will expire in March, 1910.

A. C. A. ESTABLISHES SUPPLY DEPARTMENT.

With a view to affording its members reduced prices, the Automobile Club of America has added a supply department, located on the third floor of the clubhouse, and will handle a complete line of tires and accessories.

NEW YORK MAY HAVE F. A. M. NATIONAL MEET.

In response to a call sent out by Henry Wehman, secretary of the Federation of American Motorcyclists, there was an enthusiastic gathering at the Grand Union Hotel on Monday evening last. The outcome of the meeting was the formation of the Federation of American Motorcyclists 1908 Meet Club, which was organized for the purpose of conducting the next annual meet. Toledo, O., was an applicant for the event, and the only one outside of New York. As the sentiment in favor of holding the affair here is very strong, there seems to be little doubt that New York will be decided upon. The dates are to be fixed by mail, and will not be announced for a fortnight or more.

The officers of the newly organized club are: President, R. G. Betts; vice-president, L. H. Gutermann; secretary, Henry J. Wehman; treasurer, David Dessau. Both President Betts and Secretary Wehman hold the same relative positions in the national governing body.

PROVIDENCE COMPANY GETS TAXICAB ORDER.

It has been known for some time that the William H. Seach Company, of New York, which has the cab privileges of the Waldorf, Holland House and the Park Avenue hotels, was in the market for taxicab equipment to take care of these stands, and it has been rumored from time to time that the order for them had been placed with various companies. It is now known definitely that an initial order for 100 cars has been placed with the American Locomotive Automobile Company, Providence, R. I. Two of the latter company's make have been plying in New York streets experimentally for several months past, and they won out against the entire field of both foreign and domestic types. No details are forthcoming as to the design of this smaller brother of the American Locomotive auto, but it is presumed that it will be found a most representative type of its class.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The West-Stillman Motor Car Company, Philadelphia, agents for the Pennsylvania and Mercedes, have secured the agency for the Atlas car in the same territory.

Charles A. Beber, Jr., formerly a partner in the North Side Vulcanizing Company, has just branched out for himself, establishing headquarters at 331 Michigan avenue, Chicago, where he will carry on a general tire repair business, dealing in all makes of tires and accessories.

Dating from March 16, the firm of Robert Bosch, New York, Inc., has been changed to the Bosch Magneto Company, in order to more clearly identify the name of the company's products in the public mind. The change is wholly one of title, and is merely for the reason indicated.

Pirelli & Company, the Italian tire manufacturers, who have an American branch house at 296 Broadway, New York, have just issued a revised price list on their tires, which went into effect on March 15. This concern is the oldest manufacturer of rubber goods in Italy, and has a most complete equipment of modern machinery for tire making.

Louis Strang's work on the Isotta-Fraschini at Savannah, on Thursday last, was a Michelin victory as well, for which Strang was awarded \$200 in cash, as his car was equipped with the Michelin compressed tread tires. This is the second victory for Michelins, as Bernin's Renault, which made a world's record at Ormond, was similarly equipped.

Memphis (Tenn.) automobile dealers have just formed a trade association, under the title of the Memphis Automobile Dealers' Association, of which Jerome P. Parker is president, and William Bruce, secretary. Arrangements have been completed for an automobile show, to be held on April 16, 17 and 18, next, the building having 30,000 square feet of floor space.

One of "Pal's" latest industrial works of art is the Continental Caoutchouc Company's poster advertising the Continental "Rouge Ferre" tires. It consists of a female figure surmounting one of the tires of the type in question, and as it is executed in brilliant colors, the effect is striking and unique. It is looked upon as one of the best specimens of this artist's poster work.

The Palmer & Singer Manufacturing Company, New York City, has just received its first consignment of Selden cars. The new car is a 30-horsepower, five-passenger touring type, and is universally considered one of the best of its kind ever offered at such a low selling price, namely, \$2,000. It follows standard engineering practise throughout, and is very well built, bearing no resemblance to the "original" Selden.

The Hartford Suspension Company has just been granted an injunction against the Motor Car Equipment Company, New York, agents of the Hercules Auto Specialty Manufacturing Company, of Los Angeles, Cal., restraining them from making or selling the Hercules shock absorber, which the Hartford company claims is an infringement of the well-known Hartford-Truffault device, covered by patents.

When it comes to original and attractive forms of advertising literature, Colo-

nel Sprague, of umbrella fame, who has made Norwalk, O., one of the best known cities in the country, ranks with the top-liners. His latest takes the form of a pair of calendars that will be honored with a place on the wall after their value as such has departed. They are entitled a "Bold Bluff" and "A Waterloo," and show groups of dogs playing poker, and are handsomely lithographed.

The rumor that the Winton company would market an eight-cylinder car next season is untrue. The success of the Six-Teen-Six has justified Mr. Winton's enthusiasm as to sixes, which to his mind, are infinitely superior not only to fours, but also to eights. The racing car, *Bullet No. 2*, had eight cylinders, and although this car was highly successful, Mr. Winton asserts, it is not to be compared for an instant with the Six-Teen-Six.

✓ Motor car shipments for the second week in March amounting to more than twice as much as the shipments for the first week of the month are reported by the H. H. Franklin Mfg. Co., of Syracuse, N. Y. Twenty carloads of automobiles were sent out during the week to points widely distributed throughout the country. Orders were well in advance of those for the preceding week. The Los Angeles dealer wired in for two carloads, and urgent orders for carload shipments were received from other Pacific Coast points.

"We have already received orders for 500 more cars than our agency contracts call for," says R. E. Olds, of the Reo Motor Car Company, Lansing, Mich., "despite the fact that the majority of these contracts were made as early as last September, when there was no suspicion of a financial slump. Confronted with these conditions, we have been compelled to increase our facilities for the production of 1908 models of the Reo cars, although we now have 1,100 men who have been working all winter, the Reo plant having been worked to its full capacity right through."

The Chicago Motor Car Company, which sells Packards in Chicago, figures out the question, "What becomes of all the automobiles that have been used for several seasons," thusly: These figures show that of 100 per cent. of the Chicago owners of 1908 cars, 91 per cent. of the owners of 1907 cars, 82 per cent. of the owners of 1906 cars, 80 per cent. of the owners of 1905 cars, and 50 per cent. of the owners of 1904 Packard cars, still drive their original cars. For a period of five years, 95 per cent. of all purchasers of Packards are still driving them, 87 per cent. retaining their originally purchased cars, and 8 per cent. having purchased later models of the Packard. Of the remaining 5 per cent. 2 1-2 per cent. are now driving other makes, while 2 1-2 per cent. have none.

English automobile papers have been devoting a great deal of space and attention to the recently concluded "standardization" test which was carried out with the aid of three single-cylinder Cadillac cars. The conditions were that these cars be totally dismantled, their parts being placed in three heaps. The Royal Automobile Club's technical committee then intermingled the parts promiscuously, and from the lot it was the duty of the Cadillac mechanics to reassemble three complete machines. This was done at the

garage of the Anglo-American Motor Car Company, London, agents for the Cadillac in England. After being reassembled, the cars underwent a long and strenuous test on the Brooklands race track, proving in a striking manner the accuracy of American methods of multiple production as exemplified by a car of which thousands have been turned out.

At the recent Buffalo show, the local Aetna Insurance Company agents, Knoll & Turgeon, who make quite a specialty of automobile insurance, had engaged a very prominent space, when they were confronted with the regulations that "no signs, and no advertising placards would be allowed." They were in a quandary as to how to "get their money's worth," as they had no mechanical devices to exhibit, but the difficulty was solved by mounting on a small box a toy circular saw and a toy trip hammer, operated by belts made of elastic bands, the power being supplied by a small motor. The sharp, insistent and rapid tap-tap-tap of the hammer drew the crowd, and the onlooker's gaze passing to the mechanical toys rested on a neat placard behind them, reading "We will keep right on hammering and sawing wood until we get your automobile, accident and health, and liability business," which effectively told the story.

NEW AGENCIES ESTABLISHED.

The Continental Caoutchouc Company, makers of the Continental tires, have taken on a new representative in Buffalo, N. Y., their distributing agents in that territory from now on being the Centaur Motor Company, 59 Franklin street.

The Ranger-Barrett Auto Company, Minneapolis, Minn., has taken the agency for the Glide line of cars for that city and St. Paul. This arrangement was concluded during the recent visit of R. A. Whitney, general sales manager of the Bartholomew Company to that city.

On April 1, the White Company will open a large branch house in Pittsburg, having secured the building at 138-148 Beatty street, formerly occupied by the Liberty Auto Company. W. B. Yoder will be in charge. This is the eighth White branch, and it will cover Western Pennsylvania.

R. E. Graham, of the Acme Motor Car Company, Reading, Pa., is making an extended trip through the West visiting the company's different agencies. In Chicago arrangements have been made with Webb Jay & Co., to handle the Acme line. Mr. Jay intends to enter the Acme in all events in the West to which the car is eligible.

PERSONAL TRADE MENTION.

Edward B. Lausier has resigned as sales manager of the motor department of the American & British Mfg. Co., Bridgeport, Conn., to accept an important position with the Timken Roller Bearing Axle Company, of Canton, O.

John C. Spiers, formerly factory manager of the Autocar Company, Ardmore, Pa., has just gone with the Standard Roller Bearing Company, Philadelphia, and will take full charge of the latter concern's manufacturing department.

INFORMATION FOR AUTO USERS

Duplex Carbureter.—No matter how superior the design and workmanship of a motor, or the material used in its construction, the service rendered will not be very great unless it is equipped with a satisfactory form of carbureting device. The converse is true, in that many a very ordinary engine could be vastly improved

SECTION OF THE DUPLEX CARBURETER.

by putting a good carbureter on it. The Duplex Roller Bushing Company, Belfast, Me., in their extended experience in building motor boats, some of them very fast, have had an excellent opportunity to study the problem of carburetion, and in the "Duplex," are confident that they have evolved something which fills the bill. Simplicity and reliability have been the chief aims, and following them out has resulted in a carbureter without springs or auxiliary valves. It is of the concentric float type, and has but one adjustment and one throttle, as will be seen by the accompanying sectional view illustrating the Duplex carbureter in its entirety. No provision has been made for priming, as it has been found to be totally unnecessary with this new type.

Quick-Acting Grease Gun.—Miller & Starr, 250 Green street, Brooklyn, N. Y., are placing on the market a special type of grease filler known as the Miller "Quick-Acting" grease gun, designed for replenishing the change-speed gears and shaft bearings on automobiles and motor boats. The Miller grease gun is made of the best bronze and consists of a barrel with a nozzle at one end and a cap at the other, the plunger having its shank extended through the cap, the shank itself being provided with spiral grooves. Spiral lugs in

MILLER & STARR'S QUICK-ACTING GREASE-GUN.

the cap engage these grooves to reciprocate the plunger as the shank is rotated. The plunger is advanced rapidly and with a uniform movement by turning the handle shown, only four revolutions being necessary, so that the makers claim that this gun will empty a charge of eight ounces of grease in three seconds. It can be as quickly recharged by unscrewing the cap,

and its construction obviates the tedious process of unscrewing the plunger. The lubricant can also be ejected in exactly the quantity desired by turning the handle. Moreover, it will not spill nor lose its contents through the jolting of the car.

Salisbury Wheels.—In the mind of the autoist, "wheels is wheels," and provided they do their duty uncomplainingly there is probably no one part of the car that receives so little attention as the wheels. But that there are wheels and wheels is amply evident from the catalogue of the Salisbury Wheel & Manufacturing Company, Jamestown, N. Y. The hub is the vital part of any wheel, and as it is strong or weak, the wheel itself must be likewise.

DETAILS OF THE SALISBURY WHEEL AND HUB.

It is on this account that the makers of the Salisbury wheels dwell particularly on their patent Improved Artillery hub. This is made in two parts of malleable material, the inside flanges of each half being ribbed as shown. These ribs serve to stiffen the flanges, prevent torsion, keep the bolts from shearing off, and maintain the spokes in the proper alignment, from which it will be apparent that their advantages are more numerous than would appear at first sight. This company makes wheels of this type in all sizes, from those designed for the lightest runabout up to the heaviest car, turning out special sizes and patterns to order.

SHOWING THE PITTSFIELD SPARK COIL COMPANY'S NEW ACME IGNITER.

Flentje Shock Absorber.—This is a new device of the hydraulic type, employing glycerine as the operating fluid, and on which patents have been applied for. As will be apparent from the illustration, it is of extremely simple design and construction, consisting of a piston and cylinder, the latter adapted to be attached

to the axle of the car by means of a special bracket, while the former is made fast to the frame. The best grades of steel and phosphor bronze are used in its construction, all parts being heavily coppered and nickel-plated. The piston is pierced with six ports, allowing the glycerine to pass freely on the downward stroke, but partly closing automatically, thus checking the rebound by only permitting the fluid to pass slowly. It is being manufactured and marketed by Ernst Flentje, 1643 Cambridge street, Cambridge, Mass.

FLENTJE GLYCERINE SHOCK ABSORBER.

Pittsfield Acme Igniter.—This is a new combined contact maker, timer and distributor just brought out by the Pittsfield Spark Coil Company, Dalton, Mass., in response to the demand for greater economy and reliability in ignition systems us-

EXTERIOR VIEW OF NEW ACME IGNITER.

ing batteries, and particularly dry cells, as the source of current. It is, in short, a synchronous timing system in itself, as with the addition of a single vibrating coil it is adaptable to a motor having any number of cylinders. Its increased economy

is due to the fact that contact is made mechanically, so that it is always positive, regardless of the speed of the motor or the condition of the batteries, while it also eliminates the possibility of having the contacts "freeze" together. The contacts are insured long life as the circuit make and break is provided with a magnetic "blow-out," which prevents arcing and keeps the single large platinum contact cool. As will be evident from the accompanying illustration showing the Pittsfield Acme Igniter dismantled, it consists of but a few simple parts, and as its only moving member runs on an annular ball bearing, its life is practically indefinite. No changes are required to adapt it to the average car, as it is designed to be attached to the half-time shaft usually provided for the ordinary ignition timer.

Emergency "Mud Hooks."—This is a novel and ingenious device which has just been brought out by the Garage Equipment Company, Milwaukee, Wis., and is being placed on the market in the East by the Post & Lester Company, Hartford, Conn. It is intended for emergency use on occasions which occur so frequently on American roads—that of being hub-deep in mud, snow or sand. The makers guaran-

SHOWING THE EMERGENCY "MUD-HOOK."

tee one set of them to be sufficient to enable the car to pull itself out of bad places in which any one of these obnoxious materials happens to be the retarding element, and once the car is out they can be removed again. As the makers say, "The farmer will charge the price of two sets to pull you out of one hole." For long stretches of mud or deep sand two or three sets can be used to advantage. They are made of malleable iron, weighing 5 pounds per pair and can be applied to any tire from $3\frac{1}{2}$ to $5\frac{1}{2}$ inches. They are supplied either with or without straps.

Invincible Schacht.—One of the handy buggyabout type of cars that has forged quickly to the front is the Invincible Schacht, made by the Schacht Manufacturing Company, Cincinnati, O. It was one of the first of its kind to be seen at the Boston Show recently, and attracted far more attention than did many of the high-powered and high-priced cars, as the down-Easters had heard a great deal of it, but had never seen this truly middle Western type of automobile. It is distinguished by numerous features of design and construction, employing no gears or clutches. A friction type of transmission is used, the flywheel disc of the engine being brought into contact with the driving wheel on the main countershaft by means of a pedal. Any speed from one to thirty miles an

hour can be attained by shifting the hand lever at the side of the body, and this can be operated at any time, regardless of the speed that the car happens to be traveling at. The long Concord springs and high-cushion tired wheels of second-growth hickory were familiar sights to the New Englanders, but they had never seen them

THE "INVINCIBLE" SCHACHT RUNABOUT.

combined with an automobile power-plant before. It is equipped throughout with roller-bearings, and its general appearance is quite a pleasing contrast to that of many of the high-wheelers. Its makers have been building automobiles for a number of years, so that it represents the culmination of a long experience in this line. Many agencies have been placed in different parts of the country this Spring.

Improved Tire Casings.—Unprotected casings, though they may never be called upon to do any work, deteriorate so rapidly that it is rare for an automobilist to carry them on his car without some cover. From the earliest types, in which the tire was protected by a rough canvas cover secured by buttons, various improvements have been made, until now pneumatic tires are as carefully gloved as a lady's hand. One of the latest types of casing, patents for which have been issued to H. R. Teele, is marketed by Hopewell Brothers, Cambridge, Mass. Instead of the buttons or laces usually employed, the duck or leather

SECTIONAL VIEW OF THE TEELE COVER.

casing is attached by means of a metallic casing at one end and a cord at the other. As will be seen from the sectional view, the inner diameter of the tire case does not pass over the outside diameter of the tire; consequently the inner portion of the tire case makes a perfect fit to the tire, avoiding the customary wrinkled appearance.

The Scientific Carbureter.—This is a new type of carbureter that is the invention of E. W. Stevens, East New Market, Md., and is the result of three years'

constant study of the problem of carburetion, supplemented by exhaustive experiments. The "Scientific" carbureter is not of the float feed type, as will be evident from the accompanying sectional view of Model A, designed for two-cycle motors. Probably a description of its method of operation will suffice to make matters clearer than merely describing its construction. The fuel enters at *A* and is strained by *C*, then passing the needle valve *D*. The plate *J* is pierced by four triangular openings coinciding with ports, and is moved by *K* to open them more or less as needed. The valve *D* is threaded into the piece *Y*, and at its outer end carries a pinion meshing with a rack carried by *J*, so that moving the latter causes *D* to open more or less as the throttle is moved, so that the amount of fuel used is always in proportion to the air admitted. The draught through the mixing chamber causes the wheel *N* to revolve at

DETAILS OF THE "SCIENTIFIC" CARBURETER.

high speed, thus increasing the suction on the opening of the inlet valve of the motor, causing the valve *L* to lift and admit a predetermined amount of fuel which is thoroughly mixed with the air by the revolving wheel and being blown against the hot plate of the member *Q*, and issuing at *O*. The exhaust from the engine enters at *P*, sets the wheel *R* spinning, and as the latter retains its momentum it greatly increases the scavenging of the engine. The "Scientific" carbureter is being manufactured in both two and four-cycle types by the E. W. Stevens Company, East New Market, Md.

Brampton Auto Chains.—Charles E. Miller, 97-101 Reade street, New York City, has just received a large shipment of the well-known Brampton English chains and is now in a position to supply all calls for both American and foreign standard sizes. Mr. Miller has been importing these chains for a number of years, during which time the demand for them has increased to a very great extent, as they are their own best advertisement.

THE AUTOMOBILE

AMERICAN LEADER NOW ON ITS WAY TO ALASKA

SEATTLE, WASH., March 31.—If it had not been for the seventy cars lined up on the steamship pier, waiting to act as a special escort to the Thomas, it would have seemed as if the American leader in the Paris-New York race were the first and only automobile that the inhabitants of this city had ever had an opportunity to see. Nothing brought home so strikingly to the observer the fact that the West is taking the event with the greatest interest, as the reception that the Thomas crew received on its arrival here. It was one thing for San Francisco to go wild over the Thomas, because it rolled into that city's midst right over the road it had been traveling for almost 4,000 miles, whereas here the car was hoisted out of the hold of the steamer *City of Pueblo*.

But that made no difference to the huge crowds that assembled along the waterfront two hours before the steamer was due. As soon as the tires touched the dock and the chain slings were removed the car was mobbed by autograph cranks, who wished to scribble their names all over it, so that it was some

time before the crew could get near enough to start. To do so, they had to shake hands with every one who could get close enough. Finally the Thomas, with Schuester at the wheel, led the procession through the streets, which were so packed that traffic was completely demoralized for the time being. After the parade, the Thomas was taken to a garage to be given a final rubdown before being shipped on the *Santa Clara*, which leaves for Valdez, Alaska, to-morrow. Similar scenes of enthusiasm were enacted on the occasion of the car's departure, and the Thomas, with its crew, received a truly Western send-off and God-speed on their long journey. The *Santa Clara* is due at Valdez on April 6.

Seattle is the chief winter resort of Alaskans, and men who know the country that the cars will have to traverse are here in plenty at this time of the year. Their opinions of how far the Thomas will get out of Valdez would hardly be called encouraging, and are remarkable for the unanimity, only differing slightly on the mileage question. Many are quite certain that one

The Thomas Globe Girdler Among the Current Creek Mountains, Utah, Where the Sage Brush Is Luxuriant.

Crossing a Rocky Ditch Where Differential Broke.

mile will mark the end of the journey, while it is conceded that ten miles out of Valdez will be a world's record. Charles H. Hamilton came from Fairbanks to Valdez early in February, over the same trail that the Thomas is to take, and is probably best qualified to speak. "There's no crust on Alaska snow," he says, "and it won't hold a man except on snowshoes, and the trail, or so-called post-road, is only 42 inches wide, while 10 miles beyond Valdez is Keystone cañon, where the trail narrows to 30 inches, so what is your 56-inch wide automobile going to do? Outside of the trail is nothing but snow, anywhere from 6 to 26 feet deep. At times the Delta river has three or four feet of water over the ice even in the coldest weather, so that you can't depend upon that."

Zust Enthusiastically Received at Los Angeles.

LOS ANGELES, CAL., March 31.—Upon their arrival here last night, the Italian crew were fairly mobbed by their countrymen, who showered them with oranges and flowers, and tried to drown them in champagne. The official welcome was tendered by Consul Giacomini and a large delegation from the Italian Club. From Cajen Pass, 70 miles out, where they were met by Capt. S. C. Ryus, the run was made in good time until within a few miles of the city, when a stump burst the gasoline tank. They were able to reach here without assistance, despite the accident, and ran the car to the White garage for repairs.

The De Dion reached Tonopah to-day, where it was met by a special reception committee from Goldfield, and requested to make its entry into the latter place in the afternoon. The Frenchmen complied, and found that a reception and ball had been prepared in their honor. The De Dion crew has been making up for lost time, as the 250 miles of desert from Ely to Tonopah were made in 13 hours, or a day and a half less than the Thomas required. The Protos is struggling between Granger and Evanston, Wyo., and is having a very much harder time of it than the other cars, owing to the recent thaws.

Indians at White River, Nev., Interested in Car.

A STATEMENT FROM THOMAS COMPANY.

From the E. R. Thomas Motor Company comes this emphatic statement, signed by its president:

While many competitors are fair and realize our victory benefits the whole American industry, certain knockers, to boost their sales and injure ours, have made false and malicious statements that the Thomas Flyer was not a stock car, that cylinders were changed, and that the car was necessarily rebuilt during the race. We hereby notify them that their statements are false and malicious and must cease, or they will be prosecuted to the fullest extent of the law. We make the following statement in order that our friends and the public may know the truth, and we offer \$1,000 reward for proof to the contrary:

We hereby certify that the Thomas Flyer in the New York-to-Paris race is absolutely an ordinary stock car, selected only six days before the race, and was not specially prepared or tested. Furthermore, it is identical in motor, clutch, driving shaft, radiator, carbureter, transmission gears, frame, wheels, bearings, and in all other essential features of its mechanism now in use by Thomas owners.

We also certify that the Thomas Flyer ran from New York to Cheyenne, a distance of 2,028 miles, almost entirely over roads made practically impassable by snow and mud, climbing mountains, plunging through ruts, and fording streams without overheating once; without repair or replacements of cylinders, spark plugs, transmission, radiator, bearings, clutch, carbureter, or other mechanical parts. In fact, the only breakage was two chain links, easily replaced, and a sprocket housing.

Detailed reports beyond have not been received, but telegraphic reports state repairs were insignificant and that the car arrived in

Starting Out from Tonopah, the Miners' Paradise.

San Francisco in splendid condition, ready to proceed on the long journey, a feat unparalleled in the history of automobiles—the longest and severest endurance contest in the history of the world, and one that makes the Gildden tour on well traveled roads, between large cities, pale into insignificance by comparison. The Thomas was only entered because we believed it to be a reflection on the American industry to have five foreign cars carry five foreign flags across the American continent without an American car contesting for American supremacy.

(Signed) E. R. THOMAS MOTOR COMPANY,
By EDWIN ROSS THOMAS, President.

A. C. C. OF N. J. ELECT POST PRESIDENT

TRENTON, N. J., March 31.—The annual meeting of the board of directors of the Associated Automobile Clubs of New Jersey was held here this afternoon. Wilbur F. Sadler, Jr., of this city, declined another term as president, and George A. Post, of Paterson, was elected to succeed him. Other officers chosen were: W. C. Crosby, Newark, first vice-president; Walter E. Edge, Atlantic City, second vice-president; H. A. Bonnell, Newark, secretary and treasurer. The report of President Sadler showed that during the past year the membership of the association had doubled. The directors passed a resolution indorsing a bill introduced in Congress providing for the erection of a bridge over Newark Bay, and a bill pending in the Legislature which authorizes Freeholders to issue bonds for the repair and betterment of roads.

HOW MONTAGUE ROBERTS TOLD HIS STORY.

AT the recent banquet of the Yale Automobile Club, held at New Haven, Montague Roberts was one of the guests.

"I can tell you a few things about the price of teams, and pancakes, and how it feels to be scared to death by a cowpuncher," he began. "That trip to Cheyenne was a pretty tough one, but the Harry S. Houpt company and I were too patriotic to allow any race to be run off without an American car being represented, and so when the Thomas was entered I agreed to pilot it.

"The time for me to run the machine was limited to four weeks, on account of my engagement at Briarcliff and in the Grand Prix races. After the Briarcliff races—if I don't kill myself—I shall start for France, and later take the American racer again in Siberia.

"Well, after we left New York, the snow wasn't so bad until we got to Albany. There we had to take the Erie towpath to Syracuse, where we again took to the roads as far as Buffalo. I've had dealings with farmers—I was born in Pittsburg myself—but never such dealings as I had from Buffalo on. We bucked the snowdrifts straight through to Toledo, and from there on—well, I never thought there was as much snow in the skies. Just beyond Toledo we put the car up in the village livery stable and went into a little country store to warm up. I started to wrestle with one of the boys to get my blood circulating and accidentally put my elbow through a showcase. Then the lady put me out. All the fellows followed, and we struck out for the next town. Honestly, it took us 14 hours to go 17 miles the next day, and then I was arrested for cutting down a wire fence and forced to pay \$15 in settlement. In the next town we landed in more snow, and it cost \$102 to hire four more teams to haul us out.

"In one place where we were stuck, we hired a 12-horse sled and hauled the car up on it. The car slid off into a ditch and pulled two horses in with it. It took three hours to get the car and horses out again, and some warm arguments with the teamsters regarding the cost followed. We ran the next 23 miles over the railroad ties. It wasn't so bad bumping the rails; but those thundering 'frogs' gave us a great time as we drew near Chicago. In Chicago we put on a new set of tires. It took the next two days to run 190 miles and we ruined the set. In northern Iowa the 'gumbo' mud, as they call it there, averaged anywhere from two inches to a foot deep all the while. Honestly, you'd have to help the car down hill at full speed. The sandy hills of Nebraska came next. There are no roads there—just a lot of ranches. I always had a longing to see a real cowpuncher. I've had a horse of my own, and now I've got a pair of those pants with the fuzz all down the side of 'em. They were given me by the Cheyenne Auto Club.

"Well, I met a cowpuncher near there. We were driving along at dusk, when I heard the sound of horse's hoofs behind, and then a yell. I looked around and saw one of them dashing down the line. I took out my own gun, as I did not know whether there was going to be something doing or not. He galloped up alongside, and I waited for something exciting to happen. To my surprise, he pulled out a little bunch of flowers, wrapped up in a small American flag, and said: 'Here, boys, plant these here colors in Paris. Luck be with you—go ahead!'

"At Cheyenne, the Thomas car had a lead of 516 miles. I made the driver who took my place promise to hold that lead, and I assure you that nobody will try to get a car to Paris more than the Thomas people."

On the Ferry from Oakland to San Francisco.

Arrival of the Thomas on Market Street, San Francisco.

Finish of the 500-miles Trial of the Reassembled Cadillacs at Brooklands Track, England.

BRITISH SUCCESS OF CADILLAC CARS.

LONDON, March 19.—A trio of Cadillac cars have just successfully emerged from a most severe test of standardization at the hands of the Royal Automobile Club. These popular cars are noted on this side for their reliability, and it was in order to establish an equally strong reputation for their parts standardization that F. S. Bennett, the manager of the English branch, proposed the present test.

Two members of the trials committee of the club visited the Cadillac sales depot and selected three 10-horsepower cars at random out of the stock. These were run under observation to Brooklands and straightway driven round the track for 50 miles. At the end of this preliminary jaunt the cars were taken to pieces and in three compartments of the Brooklands garage were to be seen three heaps each composed of 721 separate pieces of a 10-horsepower Cadillac. From these the judges selected at random the parts necessary for the rebuilding of the three cars, and, to show the practical utility of the standardization system, no less than 90 parts were picked out and ordered to be replaced by spare parts from the London stores. The reerection was successfully completed in quick time, the engine of the first car being started and ready to run the car round the track in 71-2 hours from the commencement.

On the two following days the three cars were run a distance of 500 miles each, the average speed for the three being 34 miles per hour and the maximum speed 39 miles per hour. The whole distance was completed without a single mechanical stop. Since this test the cars have been taken charge of by the Royal Automobile Club, and when the date of the 2,000 miles reliability trial arrives, one of the cars will be chosen by the judges to run through the trial without any preparation.

LOCOMOBILE WINS RECORD CUP CONTEST.

MEXICO CITY, March 20.—In the race for the cup offered by the *Mexico Daily Record*, a 40-horsepower Locomobile driven by J. L. Lawrence, for the Compania Mexicana de Vehiculos Electricos made the round trip between the Country club in Chirubusco and Cuerravaca, in 3:21 flat, beating a Thomas, driven by Leandro Cuevas, by 21 minutes. Owing to the narrow roads and their crowded condition, the contestants ran over the course on different days. Considering the condition of the route, which is very hilly, and the fact that it was very crowded for a greater part of the way with peones on the way to market from Morelos, the speed made was remarkable, quite a few stretches being done at 60 miles an hour and better. No tire trouble was encountered, and but five minutes were lost in replenishing the radiator, this being the only stop on the trip aside from those necessary to avoid pedestrians and burros.

HOTCHKISS TALKS TO THE CANADIANS.

TORONTO, ONT., March 28.—The annual dinner of the Ontario Motor League, held last night, was a notable affair. One of the principal speakers was President William H. Hotchkiss, of the American Automobile Association, whose remarks found much favor with those present, for the reason that just now the Canadians are experiencing some very annoying forms of drastic legislation which they hope to have modified.

Duncan McDonald, president of the Automobile Club of Canada; U. H. Dandurand, vice-president of the Ontario Motor League; Mayor Oliver, E. B. Ryckman, K.C.; Dr. Godfrey, M.P.P.; Lloyd Harris, and William Stone were among the other speakers who addressed the gathering.

Committee of the Royal Automobile Club Mixing the Parts of the Three Cadillacs, and Handing Out Set for No. 1 Car.

GRAND PRIX PLANS ARE NOW WELL UNDER WAY

PARIS, March 28.—After considering several schemes the Automobile Club of France has decided on a form of grandstand for the Grand Prix differing from any adopted heretofore. The main stand and everything connected with it is on the outside of the course about half a mile from the Dieppe hairpin turn. On the inside of the course is nothing but the starter's box and the scoreboard, this latter being a long, low placard, its highest point less than three yards from the ground. Opposite the grandstands the road has been made double width, the inner half being reserved for cars running in for tires, gasoline, or other provisions. A long, shallow pit has been built the full length of the inner road, and it is in here that the gasoline and tire stations will be established. Behind this row of boxes is a passage communicating with the entrance to each stand. The grandstands proper commence some distance from the tire stations and rise up at such an angle as to allow a perfect view from every row. The general arrangement recalls forcibly that of Madison Square Garden for the six-day bicycle race; the circular passage between the spectators' seats and the track, in this case, being the tire and gasoline stations. At one end of the grandstand will be a high tower, one story of which will be reserved for notables and the other to members of the press, telegraph connection being brought into the rear of the press room. Behind the main buildings will be the garages.

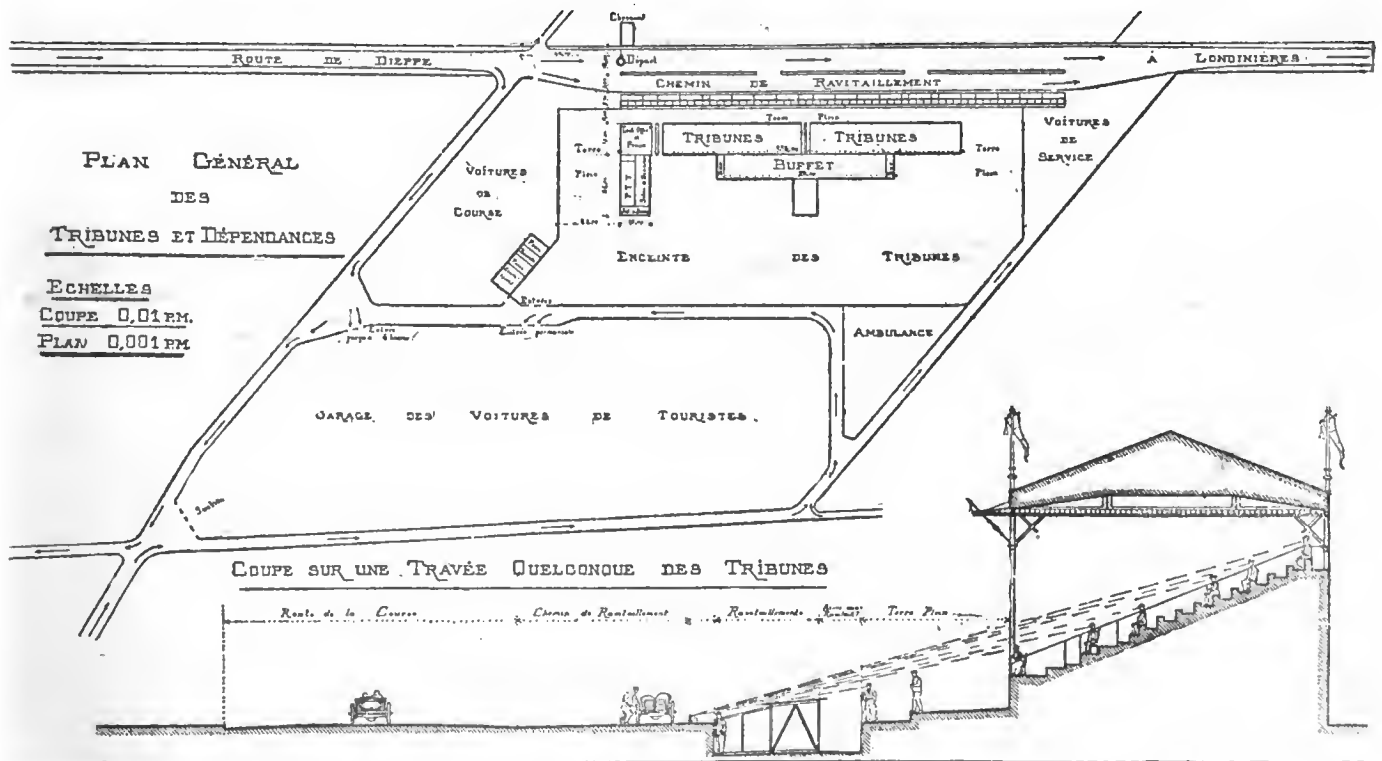

Being on the outside of the course access to and from the grandstands will be possible at all hours, even the main road from Dieppe can be kept open until a quarter of an hour after the start. Should it be considered necessary the racers will be started from the inner half of the road leaving the main portion of the course free for the passage of cars finishing the first round and passing at speed. As each machine must cut in for stoppages to take on gasoline and change tires the full width of the road opposite the grandstands will never be encroached upon for this purpose.

Racing drivers are already active on the Dieppe course, and so great has been the rush of automobiles to the Dieppe triangle that the police have had to take special measures to enforce the

speed regulations in all villages. Panhard, Brasier, Bayard-Clement, and Renault have been among those putting in a large amount of time during the past week. The three Renault racers now out have a close resemblance externally to those of last year. The four cylinders, cast in pairs, are 155 millimeters bore by 160 millimeters stroke, which is rather less than the majority of French cars constructed for the Grand Prix. Valves are all on one side, operated by a single camshaft. The engine is cooled on the thermo-siphon system, with multi-tubular radiator behind the engine, according to general Renault practice. There are three speeds forward by progressive sliding gear, shaft drive, and according to the driver's declaration, no differential. It will be remembered that the Renault which captured the first Grand Prix was also without differential.

An idea of the effort that is being made by Mercedes to recapture speed laurels may be judged from the fact that ten racing cars are being built, three of which are already on the road. In general lines there is nothing which distinguishes them from last year's models. The engine is declared to have the maximum bore and a stroke of 170 millimeters. Low tension magneto is employed with Bosch magneto.

Great Britain has selected an excellent team of racing drivers for the three Austin cars entered in the Grand Prix. Lee Guinness, the rich amateur driver, known to the world by reason of his connection with a certain brand of stout, stands forth in the automobile world as the owner of the 200-horsepower eight-cylinder Darracq, recognized as the fastest car in the world. Resta, who will handle the second car, has an excellent reputation as a driver of fast cars on Brooklands track, and Warwick Wright, the Darracq representative in England, has already won sufficient races at Brooklands and on the road for him to be considered the equal of any of the Continental drivers. Weigel, who drove his own car in the last Grand Prix, will be a spectator this year, the withdrawal of his license making it impossible for him to handle a car in his own country. The only driver who has been definitely selected is Coleman, an automobilist little known outside of home circles.

Grand Stand Arrangement for the Grand Prix—Upper Design Shows Floor Plan—Lower Design Shows Side Elevation of Stand.

FATHER KNICKERBOCKER SEEMS KEEN FOR THE CARNIVAL

EVERYTHING is now in readiness for next week's carnival in New York City to celebrate the tenth trade birthday of the automobile in this country and to formally open the selling season of 1908. Indications point to an automobile function far greater in magnitude than the most sanguine of its promoters of the New York Automobile Trade Association ever expected. Already "Automobile Row" is beginning to take on its holiday dress of bunting and carnival flags. Letters are pouring in on the dealers telling them of the intention of the writers to make a week of it in New York. Whether the big selling counted on occurs during opening or at a later week, the New York tradesmen are well satisfied that they will have given automobiling locally a big and beneficial boom at a time when some weak-kneed ones were a bit shaky over trade prospects.

Carnival week will be marked by four specially scheduled features, three of them taking place at night so as not to interfere with the examination and purchase of cars, which will be one of the main objects of many of the visitors to town.

formally entered in competition for first and second prize trophies for artistic beauty of embellishment. A trophy will also be awarded the most grotesquely decorated car. No names, signs, or other advertising features will be permitted in this division.

A division, which promises much in the way of exploitation of the business utility of the automobile is the fourth, whose place of assemblage will be Fifty-fourth street. To it are assigned not only commercial cars of every type, but also floats for advertising purposes.

On the night of the parade Eighth and Ninth avenues will be closed between Fifty-third and Fifty-eighth streets.

Novel judges' and reviewing stands have been conceived. They will consist of sight-seeing 'buses and touring cars parked on either side of the esplanade on Broadway between Eighty-seventh and Eighty-eighth streets facing the curbs on either side.

The hill-climb will take place at half past one o'clock on Thursday afternoon on Fort George hill, starting at Dyckman street, which has a station on the Broadway division of the

A Practice Trial by a Rambler on Fort George Hill, where Carnival Event Will Take Place.

On Tuesday night there will be a monster parade of illuminated and decorated cars. Thursday will be given over to a series of hill climbing contests at Fort George. A joy ride is scheduled for Friday night with Gramatan Inn, at Bronxville, as the place of rendezvous, and a banquet there as the attraction. Carnival week will wind up with a trade smoker at the A. C. A.

The trade will have for its grand marshal R. G. Howell and will move in four divisions. The route to be followed will be down Broadway to Twenty-fifth street, east to Fifth avenue, north to Fifty-ninth street, west to Broadway, and north to One Hundred and Tenth street, where it will countermarch down Broadway and disband at Columbus Circle. The first division will form in Fifty-seventh street. The place of honor in it will be given to the pioneer models of 1903 and earlier vintages. Following the old 'uns as an escort will be the racing cars, veterans of famous contests of the past, and candidates for coming struggles on road and track. The second division will line up in Fifty-sixth street. This will be the dealers' section and be a moving exhibition of all the models of 1908. No decorations or advertising will be allowed on the cars beyond the name of the dealer.

Great interest from a spectacular and competitive standpoint will attach to the third division, which will form in Fifty-fifth street. It will be made up exclusively of decorated cars for-

subway. The program as arranged by the committee follows:

1. Gasoline cars selling for \$850 or less.
2. Gasoline cars selling from \$851 to, and including, \$1,250.
3. Gasoline cars selling from \$1,251 to, and including, \$2,000.
4. Gasoline cars selling from \$2,001 to, and including, \$3,000.
5. Steam, gasoline or electric cars, selling from \$2,001 to \$3,000.
6. Gasoline cars selling from \$3,000 to, and including, \$4,000.
7. Four-cylinder cars selling for more than \$4,000.
8. Six-cylinder cars selling for more than \$4,000.
9. Free-for-all, open to cars of all motive powers.
10. Open to steam cars only.
11. Open to electrics of all types.

It has been decided that if a sufficient number of entries are received for the climb, suitable trophies will be substituted for the ribbons originally intended as prizes. The chief officers chosen for the climb are Jefferson deMont Thompson, honorary referee; A. R. Pardington, referee; C. J. Edwards, Robert Lee Morrell and A. G. Batchelder, judges; F. J. Wagner, starter, and the Timers' Club of New York, timers.

Those desiring to join the banqueters at Gramatan Inn on Friday night should not later than Monday notify Walter Lee, secretary of the New York Automobile Trade Association, Bryant Park building, giving the names of their party so that seats may be reserved together. The price of the dinner tickets have been set at \$1.25. It is not a stag affair, ladies being also expected.

The New Paulham-Kaepferrer Aeroplane with Its 35-horsepower, Six-cylinder Motor and Four-bladed Propeller.

FARMAN IS STILL THE AIR CHAMPION.

PARIS, March 28.—Henry Farman is still the world's champion flyer. Since winning the Deutsch-Archdeacon prize, the Anglo-French aeronaut has been occupied almost exclusively with the rebuilding of his machine. Yesterday evening, at the Issy-les-Moulineaux ground, he made two flights of the most successful nature, the first one being over a distance of one and a half miles in 2 minutes 50 seconds, and the second over a circle estimated at 1.8 miles in 2 minutes 55 seconds. Unfortunately, the officials of the Aero Club were not present to control the flight, and, in order that all may be regular, Farman has given official notice of his intention to fly in the presence of an Aero Club delegation against his own record.

In the course of the trials, while Farman was practising circling, he gave the machine too much inclination, and, as the machine was close to the ground, one of the wings struck the ground while going at a good rate of speed and threw the inventor out. He left some of the skin of his nose and forehead on the ground, but was otherwise unhurt.

An Appeal for Prizes.

PARIS, March 28.—Ernest Archdeacon, who, with M. Deutsch, gave the \$10,000 prize recently won by Henry Farman, has made an appeal, through the Paris *Herald*, to wealthy Americans to subscribe the sum of one million francs (\$200,000) for prizes to encourage the science of aviation. By offering prizes instead of spending money on personal experiments, M. Archdeacon says that fully \$100,000 was expended in attempting to win the prize, and unthought-of progress was the result. He is of the opinion that there are plenty of men in America who can afford to give largely, and he may even undertake an expedition to America for that purpose. How much success he will have should he cross the ocean is considered rather problematical.

GERMAN AERONAUTIC INTEREST KEEN.

BERLIN, March 27.—German patriotism has been aroused to the extent of offering a prize of \$10,000, which has been handed over to the German Aeroplane Club by Karl Lanz, a Mannheim merchant, to be contested for by machines of the heavier-than-air type. They must be constructed entirely in Germany, and of German materials. The competition will be held on the Tempelhof parade ground. Herr Lanz has also donated \$2,500 to aid poor German aeroplane inventors.

Progress has been so rapid that the Aero Club has now established itself in a splendid new home at Wollendorf Platz, No. 3, the quarters comprising meeting, dining, smoking and tea rooms, beside an assembly hall, and are elaborately fitted throughout. The club has also taken a country house, and its members are looking forward to a most prosperous future. It is understood that the emperor is taking increased interest in aeronautical matters, and greater recognition is expected from him in future.

AERONAUT BISHOP TALKS

NEW YORK, April 1.—At the fortnightly entertainment of the Automobile Club of America, held at the clubhouse Tuesday evening, Cortland Field Bishop, president of the Aero Club of America, delivered a lecture, entitled, "Some European Highways as Seen by an Automobilst." His lecture dwelt particularly upon the value of the strategic mountain roads of the French side of the Franco-Italian frontier, and was profusely illustrated with lantern slides made from negatives taken by Mr. Bishop himself while touring the Continent. The talk was one of the most interesting that the club members have been treated to in a long while, and was enthusiastically received, as it showed in a most striking manner the tremendous amount of work that must be done in this country before America can claim to have a highway system that can be dignified by this title.

Propeller and Housing of the Paulham-Kaepferrer.

WHAT IS BEING DONE IN CLUBDOM

FIGURES FROM CLUB DYNAMOMETER TESTS.

NEW YORK CITY, April 1.—A report has just been issued by the Automobile Club of America showing the results that have been obtained in the dynamometer tests of 17 different machines, most of them being owned by members. As will be recalled the dynamometer is designed to show not only the working horsepower of a car, but also the speed in miles per hour and feet per second, according to the gear used; the hill-climbing ability, and the holding-power of the brakes. The power reading is taken at the rear wheels in contrast with the usual motor rating, which does not take account of transmission losses, usually averaging about 25 per cent.

Although the cars are tested on all speeds and on each gear, in the following tabulated results of the tests, only one speed is given. In this table, it will be noticed that some of the cars give an output at the rear wheels in excess of their rating, though the latter is, in many cases, only nominal. One of the Packard "30" 1907 models, belonging to J. M. Fiske, showed 33 horsepower, on the first speed, while G. E. Schanch's "30" Peerless also showed the same rating on this speed. The smallest car tested was a Delahaye taxicab, which is in daily service about the city. On third speed it showed an output of 5.25 horsepower. The table is as follows:

Car, H.P. and Type	Maximum H.P. at Wheels	Miles Per Hour	Gear
Mercedes, 40, runabout.....	29	42	4th
Pope-Hartford, 30, touring.....	25½	36	3d
Westinghouse, 35-40, touring.....	30	25½	2d
Stoddard-Dayton, 40, runabout.....	30	43	3d
Packard, 30, runabout.....	33	12	1st
Pierce Arrow, 40 (6 cyl.), touring.....	30	43	3d
Pierce Arrow, 28-32, touring.....	21½	11	1st
Simplex, 50, touring.....	44	46	3d
Packard, 24, limousine.....	20½	13	1st
Stoddard-Dayton, 40, runabout.....	24	44½	3d
Oidsmobile, 35, runabout.....	15	34½	3d
Stevens-Duryea, 30 (6-cyl.), touring.....	26	40	3d
Delahaye, 8-9, landaulet.....	5½	25	3d
Locomobile, 15-20, limousine.....	13½	7	1st
Thomas, 40, runabout.....	23	40	3d
Peerless, 30, touring.....	33	14	1st
Packard, 30, touring.....	35	28	2d

NOTED NAMES AMONG A. C. A. NOMINEES.

NEW YORK, March 30.—The regular ticket put forth by the nominating committee of the Automobile Club of America will give the club several new officers not hitherto connected with the management of the club. It embraces names high up in financial business and social life, whose various connections therewith are well known. The nominees, who have been approved by the board of governors and will be voted upon at the annual meeting of the club on April 14, are: President, Judge E. H. Gary; first vice-president, Henry Sanderson; second vice-president, William G. McAdoe; third vice-president, Robert Lee Morrell; treasurer, Edgar L. Marston; governors, Cornelius Vanderbilt, General Horace Porter, F. D. Underwood, W. Pierson Hamilton, Colgate Hoyt, Waldron Williams, and Dr. Schuyler S. Wheeler. The governors who will remain in office are: Winthrop E. Scarritt, Dave Hennen Morris, Col. John Jacob Astor, George F. Chamberlin, and Albert R. Shattuck.

CINCINNATIANS SECURE HOTEL CLUBROOMS.

CINCINNATI, March 30.—Permanent clubrooms have been secured on the second floor of the Gibson House for the use of the Automobile Club of Cincinnati. The recent annual election of the club resulted in the choice of the following: President, Dr. Charles L. Bonifield; first vice-president, C. Gordon Neff; second vice-president, D. McKim Cooke; secretary, Dr. L. S. Colter; treasurer, Harry L. Manss; consulting engineer, E. J. Carpenter; board of governors, G. W. Drach, Val Duttonhofer, Jr., Dr. A. B. Heyl, C. E. Bultman, Paul H. Verkamp, and Louis Merkel. The three last named are recent recruits.

\$10,000 IN GUIDEPOSTS FOR CHICAGO.

CHICAGO, March 30.—Thanks to the signboard committee of the Chicago Motor Club, 1,000 miles of roads embracing eleven different routes leading from the city, are to be marked by guideposts. The cost of this great plant is estimated at from \$7,000 to \$10,000. Already the order for the first 1,000 signs has been placed. Most of the work will be done this summer, and when completed Chicago will have set a shining example to motordom of what can and ought to be done by the clubs, dealers, and automobilists at large of every city. The setting out of the posts and the erection of the signs will be begun by May 15. The committee counts on having at least four of the routes covered by June 1. A donation of \$1,000 by the Chicago Motor Club, and of \$350 by the Chicago Automobile Trade Association, added to \$539 from the old signboard commission, formed the nucleus of the fund. The signs will be of cast iron and the posts of cedar, 10 feet high. The posts and the background of the signs will be painted white to contrast at night with the black letters. The metallic paint will be renewed annually.

The routes to be marked are those to South Bend, Ottawa, Rockford, Cedar Lake, Ind., Kankakee, Lake Geneva, Milwaukee, Fox Lake, and Aurora and Elgin. Members of the signboard committee, which consists of J. V. Lawrence, Harry Branstetter, E. Q. Cordner, Paul Picard, Berne Nadall, W. H. Mason, O. G. Temme, N. H. Van Sicklen, Jr., and William R. Johnson, have already marked out the location of the posts. The signs will also give warning of hills, deep cuts, turns, railroad crossings, and other danger places ahead.

FIRST RUN OF NEW PENNSYLVANIA CLUB.

PHILADELPHIA, March 30.—Many local automobilists are preparing to take part in the first annual endurance run of the Norristown Automobile Club, which is scheduled for Tuesday, April 28. The route selected, which is about 123 miles in length, will be triangular in shape, with Norristown, Lancaster, and Reading at the three corners. A total of 7 hours 15 minutes will be allowed to cover the course. There will be checking stations at Coatesville, Lancaster, Reading, Pottstown, and Norristown. The going is sufficiently varied to make the run a hard test. The Lancaster-Reading leg, 31.7 miles, for which 1 hour 55 minutes will be allowed, will furnish the hardest going, and, if the weather be wet, clean scores will be a *rara avis*.

MILL CITY AUTOMOBILISTS ORGANIZE.

FALL RIVER, Mass., March 30.—Autoists of this city and vicinity have formed the Fall River Automobile Club. The new club has secured a charter from the Secretary of State and elected its first board of officers as follows: President, Dr. George L. Richards; vice-president, Earle P. Charlton; secretary, Arthur S. Phillips; treasurer, Albert A. Harrison; directors for three years, Earle P. Charlton, Robert Marshall, John P. Hilton; directors for two years, George L. Richards, Edward B. Jennings, Edmund Cote; directors for one year, Herbert C. Talbot, George D. Flynn, and Edward B. Remington.

DEAD HORSE HILL CLIMB MAY BE REVIVED.

WORCESTER, Mass., March 30.—The governors of the Worcester Automobile Club have called a meeting to decide on a date in May, at which time the annual meeting of the club and the elections of officers for the ensuing year will be held.

It is expected that the Dead Horse Hill climb will come up for consideration and discussion at this meeting.

At this meeting will be chosen the successor of the late secretary of the club, Robert M. Pratt. I. C. Caton has been acting as secretary since Mr. Pratt's death.

GOVERNMENT TESTS ALCOHOL AND GASOLINE

THE Technologic Branch of the United States Geological Survey, under the direction of J. A. Holmes, has recently completed an elaborate series of tests on the relative value of gasoline and alcohol as producers of power. The tests, over two thousand in number, probably represent the most complete and exact investigation of the kind that has been made either in this country or abroad, and include much original research.

Professor R. H. Fernald, Engineer in Charge of the Gas Producer Section and professor of mechanical engineering in the Case School of Applied Science, Cleveland, O., was in general charge of the tests. R. M. Strong, formerly connected with the engineering department of Columbia University, had personal supervision of the work. He was assisted by a corps of specially trained men. These tests were conducted at the Fuel Testing Plant of the Geological Survey at Norfolk, Va., and show the following results in regard to the comparative fuel

revolutions per minute, while the alcohol engines were of similar construction and identical in size with the gasoline engines. The air was not preheated for the tests, and the engines were equipped with the ordinary types of constant level suction lift, and constant level pressure spray carbureters. Many special tests with air preheated to various temperatures up to 250 degrees Fahrenheit, and tests with special carbureters were made, but no beneficial effects traceable to better carburetion were found when the engines were handled under the special test conditions, including constant speed and best load.

The commercial completely denatured alcohol referred to is 100 parts ethyl alcohol, plus 10 parts methyl alcohol, plus .5 part benzol, and corresponds very closely to 94 per cent. by volume, or 91 per cent. by weight, grain alcohol. No detrimental effects on the cylinder walls and valves of the engines were found from the use of the denatured alcohol. The lowest consumption

Interior View of the Government's Specially Equipped Fuel-testing Plant at Norfolk, Va.

consumption of 73 degree specific gravity gasoline and commercial completely denatured alcohol, per unit of power.

Correspondingly well-designed alcohol and gasoline engines, when running under the most advantageous conditions for each, will consume equal volumes of the fuel for which they are designed. This statement is based on the results of many tests made under the most favorable practical conditions that could be obtained for the size and type of engines and fuel used. An average of the minimum fuel consumption values thus obtained gives a like figure of .8 pint per brake horsepower hour for gasoline and alcohol.

Considering that the heat value of a gallon of the denatured alcohol is only a little over .6 that of a gallon of gasoline this result of equal fuel consumption by volume for gasoline and alcohol engines probably represents the best comparative value that can be obtained for alcohol at the present time, as is also indicated by Continental practice. Though the possibility of obtaining this condition in practice here has been thoroughly demonstrated at the government Fuel-Testing plant, it yet remains for the engine manufacturers to make the "equal fuel consumption by volume" a commercial basis of comparison.

The gasoline engines that were used in these tests are representative of the standard American stationary engine types, rating at 10 to 15 horsepower, at speeds of from 250 to 300

values were obtained with the highest compression that it was found practical to use; for the denatured alcohol, this ranged from 150 to 180 pounds per square inch above atmospheric.

Eighty per cent. alcohol (alcohol and water), for use in engines of the present types, would have to sell for at least 15 per cent. less per gallon than the denatured alcohol, in order to compete with it. The minimum consumption values in gallons per brake horsepower hour, for 80 per cent. alcohol, is approximately 17.5 per cent. greater than for the denatured alcohol used, or for gasoline. A series of tests made with alcohol of various percentages by volume, ranging from 94 per cent. to 50 per cent., showed that the minimum consumption values, in gallons per brake horsepower hour, increased a little more rapidly than the alcohol decreased in percentage of pure alcohol. That is, the thermal efficiency decreased with the decrease in percentage of pure alcohol. This decrease in thermal efficiency, or increase in consumption referred to for pure alcohol, is, however, comparatively slight from 100 per cent. alcohol down to about 80 per cent. alcohol. Within these limits, it may be neglected in making the calculations necessary to compare the minimum consumption values for tests with different alcohol percentages.

The purer the alcohol is, the greater the maximum horsepower of the engine. The reduction in maximum horsepower for 80 per cent. alcohol, as compared with that for denatured alcohol

used, was less than 1 per cent., but the starting and regulating difficulties are appreciably increased.

With suitable compression, mixtures of gasoline and alcohol vapors (double carbureters) gave thermal efficiencies ranging between that for gasoline (maximum 22.2 per cent.) and that for alcohol (maximum 34.6 per cent.), but in no case were they

One of the 10-Horsepower Nash Engines Used.

higher than that for alcohol. The above thermal efficiencies are calculated from the brake horsepower and the low calorific value of the fuel, which, for the gasoline, was 19,100 B. t. u. per pound, and for the denatured alcohol, 10,500 B. t. u. per pound.

As has been previously published, alcohol can be used with more or less satisfaction in stationary and marine gasoline engines, and these gasoline engines will use from one and one-half to twice as much alcohol as gasoline, when operating under the same conditions. The possibilities, however, of altering the ordinary gasoline engine as required to obtain the best economies with alcohol are very limited. The amount that the compression can be raised without entirely redesigning the cylinder and valve arrangement, is ordinarily not sufficient, nor are the gasoline engines usually built heavy enough to stand the maximum explosive pressures, which often reach six and seven hundred pounds per square inch. With the increase in weight for the same size engine designed to use alcohol instead of gasoline, comes an increase in maximum horsepower of a little over 35 per cent., so that its weight per horsepower need not be greater than that of the gasoline engine, and probably will be less.

The work was taken up to investigate the characteristic action of fuels used in internal combustion engines with a detailed study of the action of each fuel as governed by the many variable conditions of engine manipulation, design and equipment. These variables were isolated, as far as possible; their separate and combined effects were determined, worked out under practical operating conditions, and led up to the conditions required for minimum fuel consumption. The results show the saving that can be obtained over conditions for maximum consumption, and also establish a definite basis of comparison under conditions most favorable to each fuel. This latter is a point of much commercial interest, and a study of the comparative action of gasoline and alcohol may be of great service in solving some of the general internal combustion engine problems where other than liquid fuels are used.

A large number of fundamental tests were necessary in order

to clearly define conditions and interpret results. In a way, they follow the work conducted by the Department of Agriculture, supplementing to a certain extent, but not duplicating, Bulletin 191, which gives much data of general value. Many of the tests of internal combustion engines have been made, but most of them, especially in this country, were by private concerns, for a specified purpose, and the results are not generally available. Furthermore, as is generally recognized by those familiar with gas, and especially gasoline engine operation, the conditions influencing engine performance are so numerous and various as to make the value of off-hand comparison very limited and often misleading, exact comparisons only being possible under identical conditions, or with reference to the actual known differences in all conditions that influence the results.

FASTENING FLANGES TO TUBES.

By E. T. BIRDSALL, M.E.

In the design of most automobiles and motor boat engines, steel and copper tubing having comparatively thin walls is used for inlet, exhaust and water conduits. This tubing is connected to the engine and its accessories by means of flanges, usually by soldering or brazing. The brazing of the flanges to the tubes is an expensive operation calling for a brazing plant, and the soldering always gives more or less trouble. In addition, there is the labor of cleaning off the scale and surplus brazing or soldering material from the parts, which are often seriously damaged by the heat required in the operation.

The process of rolling or expanding the tubes into the flanges, or other parts, in exactly the same manner as boiler tubes are secured into a boiler shell, has been used by the writer for some time with perfect success. The only tool necessary is a roller-expander having the rolls specially shaped for the work. In the illustration, the flange is shown with a recess turned in its interior and the roller is so shaped and adjusted that when the stop on the expander is against the end of the tube, the greatest diameter of the rolls will be opposite the recess of the flange.

The job shown is a 1 3/4-inch O. D. seamless steel exhaust pipe of No. 16 gauge, expanded into a steel casting flange. The pipe projects 1-8 inch beyond the face of the flange and into the exhaust manifold in order to prevent the gasket from blowing out.

Simple Method of Fastening Flanges to Tubes.

These joints can be made by one man and require about five minutes each. They are absolutely gas-tight and present a very neat and workmanlike appearance. A tube can be securely fastened in this manner to a part, that, owing to its low melting point, shape, location, or other cause, would not admit of the brazing process, and the job when made in this fashion is not only far neater in appearance, but is likewise much more durable and is not apt to give trouble at an unexpected time.

COMPARISON OF FOUR AND SIX-CYLINDER MOTORS

By ARTHUR H. DENISON.

NOW that the amusing comparisons by enthusiastic manufacturers of four and six-cylinder engines of the centipede, spider, horse, ostrich, and "even peaches growing on cedar trees" types is at an end, the purchasing public is interested mostly in the dollars question; also what actually takes place in the four-cylinder and the six-cylinder motors, that one is claimed to be so much superior to the other. Judging from questions asked on the subject, there may be a widespread impression that the addition of two cylinders is merely an excuse to hide defects in the design and construction of the four-cylinder motors. Here

is a mixture of burnt and new, or fresh, gas that will cause a fairly high compression, yet poor explosion, because we cannot burn gas twice, and a portion of the charge is burnt gas. This diagram, considered as taken from cylinders No. 2 or 3, may show a slightly higher efficiency than from cylinders No. 1 and 4, due to inlet and exhaust manifolds and water connections. If ignition had taken place nearer the theoretical point *B I*, the dotted line would represent the curve, showing slightly more power developed.

In a four-cylinder motor, while one piston is descending on its power stroke, another one is ascending on its compression stroke. Considering the diagram, the piston on power stroke is subject to effective pressure for about 1-4 to 1-3 of its stroke, the pressure gradually becoming weaker until, when the exhaust valve opens, it has fallen to about 1-4 of its initial pressure.

With the valve opening 30 degrees ahead on a motor with a 5-inch stroke, this represents 1-6 of the stroke or 5-6-inch. This amount of lead is absolutely necessary to allow the expanding efforts of the gas to be directed through the open valve, thus relieving the motor of much work in clearing them out, and also to reduce back pressure. There is, therefore, during each one-half revolution power being developed in one cylinder and three other pistons working yet using power. There is also a period of constant pressure against the piston lasting only a fraction of the stroke, and this energy must be stored in such a manner that the rest of the motor may draw on it without materially affecting the speed of the engine. Consequently, we have flywheels weighing up to 150 pounds and up to 28 or 30 inches in diameter. This flywheel may seem to keep the engine running smoothly, yet actually it is far from doing so.

The cylinder, whose piston is on its compression stroke, is constantly demanding more power to overcome the resistance of the gas at a time when the power stroke has practically ended and ignition taken place before dead center puts a heavy load on the flywheel to carry the piston over dead center against the pressure of the expanding gas, as the diagram, Fig. 1, shows, running as high as 15 atmospheres. Those who have felt a back-kick when cranking will realize the amount of power needed. The two other cylinders, one on the exhaust stroke and the other on the suction stroke, are also using power to overcome the resistance of valve springs as well as friction at every contact

Fig. 1.—Typical indicator diagram showing average efficiency.

it may be said that a theoretically perfect motor, if such could be built, will give most unsatisfactory results, if subjected to inexperienced handling.

Consider first the four-cylinder, four-cycle motor. This represents the highest efficiency possible to obtain for general touring purposes, from the least number of cylinders and the minimum weight. Giving one power impulse for every half revolution of the flywheel the four-cylinder motor when turning at a speed of 300 revolutions per minute or more and propelling the car, causes so little vibration that one is conscious only of the smoothness and quietness of the machinery—assuming a well-built car, of course. If the car is standing and the motor running slowly, vibration cannot be escaped under any conditions or with any motor, and usually it is disagreeable to the occupants of the tonneau. In order to effectually compare the four and six-cylinder motors, we must thoroughly understand the relations of the essential parts of each motor, the flywheel, pistons, carbureter, etc., and their influence on the action of the motor.

Fig. 1 is taken from a photographed diagram of a four-cylinder motor, but the diagram, showing what took place in an individual cylinder, may be considered as a typical diagram of one-cylinder, irrespective of whether a one, two, four, six, or eight-cylinder motor is under discussion. *F* indicates the beginning of the suction stroke; *A* the lower dead center and commencement of the compression stroke, ignition taking place at *B*, the pressure rising to about 15 atmospheres at *C*, and the curve *D*, the drop in pressure to the exhaust valve opening at *E*. Therefore, the distance from *F* to *A* represents one-half revolution of the flywheel on the length of the motor's stroke. The line 1-2 indicates the line of atmospheric pressure. This diagram represents a fairly high standard of efficiency. Its faults are: Ignition was a little retarded, taking place almost on dead center. The exhaust stroke finishing slightly above the line of atmospheric pressure indicates trouble in getting rid of the exhaust, possibly in valve-timing or in the muffler, and this will materially affect the action of the carbureter and quality of the mixture in the following suction stroke. This is indicated by the end of the suction stroke lying below the line of atmospheric pressure; therefore, what we really have during the compression stroke

Fig. 2.—Diagram showing how in four-cylinder motor a large portion of each stroke is not developing power, the curve passing below the line of no pressure. In the six-cylinder motor the curve never reaches the line of no pressure.

point, and the flywheel must supply all of this. Thus, in one complete revolution, the flywheel must alternately receive and give energy. During this revolution, the flywheel receives energy through about 1-3 of the stroke; therefore, 2-3 of the stroke, or 2-3 of the revolution, the motor is dependent upon it, the proportions being the same.

Considering the six-cylinder motor from the same standpoint, Fig. 1 may be taken as a diagram from one of its cylinders, the dimensions being the same in both motors. The individual

operation is similar to that in the four-cylinder motor. There are also two more cylinders working; consequently, that much more power to be utilized. This is done by constructing the crankshaft in three series of two rows—see Fig. 3 and pistons Nos. 1 and 6, 2 and 5, and 3 and 4 on the same horizontal plane. Each cylinder fires separately, and,

Fig. 3.—Diagram showing relative positions of the crank pins of a six-cylinder motor flywheel flange in rear. Shaft viewed from the front end.

Summing up theoretically, there is a decided advantage in favor of the six-cylinder motor, but there are many other things worthy of being taken into consideration. In the four, the flywheel, receiving and then giving energy, is subject to a certain amount of fluctuation in its speed. The impulses delivered by the motor may be likened to an alternating current wave, rising to maximum pressure, then dying away. This produces considerable vibration, which will be apparent by watching mudguards, searchlights, dash-lamps, and, in large motors, a very pronounced quivering of the whole car is seen. It also has a bad effect on the machinery, locking of nuts and bolts, and hastens fatigue. The six, on the other hand, with the steadier flow of power and the energy developed by each impulse being used directly, does not require as large a flywheel or shake things up nearly as much. The sound resembles a contented purr, the note from one exhaust blending into the next, instead of the sharp beat noticeable in the four.

The six-cylinder car cannot be called a fad. Many manufacturers are building both four and six-cylinder cars, and some exclusively sixes. One successful six-cylinder car, the Stevens-Duryea Big Six, with cylinders 4 3-4 by 5 1-4 inches, uses a flywheel catalogued at 90 pounds. On the 1906 Thomas four-cylinder 5 1-2 by 5 1-2-inch motor the flywheel weighed 105 pounds, and on the 1906 Peerless four-cylinder, 4 1-2 by 5-inch motor the flywheel weighed 96 pounds. Weight of flywheel has been a strong six-cylinder talking point, yet these figures denote much weight saved. Possibly the reason for using so large a flywheel is to take care of the motor in case of trouble: two cylinders giving trouble would have a more marked effect on the performance of the motor than one cylinder in the four, considering crankshaft in arrangement and resistance of dead cylinders. Another point is the extra weight of the engine. This is important, as a car able to stand pounding over indifferent roads must, even with fine materials, go over 3,500 pounds fully loaded and with passengers. This, with added weight of accessories, water, extra length in crankshaft,

Fig. 4.—Diagram showing relative positions of the crank pins of a four-cylinder motor, with flywheel flange in rear. Shaft viewed from front end.

case, and manifolds, means a substantial amount. To keep the extra cylinders cool means larger water capacity and increased radiator surface. The increased length necessary in engine is obtained by sacrificing space in the body or tonneau, or a wheelbase so long as to make the car unwieldy. The extra power means a larger factor of safety generally, and with a motor bolted solidly to the frame, the twisting due to rough roads imposes a bending strain on the crankshaft, in addition to the load of the power impulses. This bending and twisting of the frame throws the bearings out of line also, and the crankshaft endeavoring to maintain its alignment increases enormously the strain on the bearings. This is sufficient to force the oil out, and then the shaft and bearing suffer.

The peculiar phenomenon presented by a child's top or toy gyroscope is also present in the automobile flywheel. On a powerful motor, running light, its action may be noticed by the slight movement of the frame in the direction opposite to that in which the motor is turning. The force of gyroscopic action is said to increase with the weight of the spinning disc and its speed, but this force is not very well known, and it presents many peculiar and unexplainable properties. It is seriously considered as responsible for different troubles, such as broken steering gears, tire troubles, etc., that cannot be accounted for otherwise, and its influence on the long crankshaft of the six-cylinder motor might form an interesting chapter. Recent foreign reports seem to indicate that prominent French constructors will pin their faith on four-cylinders in the coming Grand Prix race. They are also willing to build anything the public will pay for. In conclusion "price" must be put down as the deciding feature. Both types are standardized, both giving excellent service. While the six-cylinder motor overcomes the disadvantages of the four in a marked manner, the purchaser must decide for himself whether on the whole the increased weight, cost, and advantages are worth the increased price.

GAS FLAME TO REPLACE SAW.

The employment of the oxyhydrogen blowpipe flame for industrial purposes is rapidly extending, says Robert Grimshaw in *The American Machinist*. Recently it has come into play for melting out "scaffolded" blast furnaces. It is further being used for melting off fins from castings, cutting off iron and steel, cutting out manholes—or cutting out the metal and leaving the holes, as it please you better—and naturally, for welding. This latter operation has long been done with a blast flame consisting of hydrogen and ordinary air, where of course the oxygen being less plentiful, the heating effect is not so great. Among the welding processes thus carried out is the manufacture of wrought-iron tubes from strips of wrought iron wound about a mandrel. The Ferrum Iron Works, in Upper Schlesien, has extended the oxyhydrogen welding process to the manufacture of tubes, which being intended to withstand a very severe internal air, water or steam pressure without leaking, are made of quite heavy strips of iron or steel sheet; the latter by reason of their comparatively great thickness would not lend themselves very well to the spiral rolling process, hence are made with a lengthwise weld. The principal advantage of the gas weld is, independently of the greater speed and convenience in making it, the fact that no slag is formed between the welded surfaces, hence the seam is more truly "metal to metal." The Deutsche Oxhydric Gesellschaft has for some time been making experiments as to the shape of burner, etc., best adapted to do neat and rapid work in cutting off, or in cutting out metal plates, etc. The most recent development in this line is the combination of a foreheating apparatus employing oxygen and hydrogen, with a cutting jet of pure oxygen playing on the surface previously made red hot by this oxyhydrogen jet. In the course of time, its use will doubtless be extended to a great many other processes.

ABOUT FORGINGS FOR AUTOMOBILE WORK*

BY RICHARD W. FUNK, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

AS the complete subject outlined in the title may not be embraced in a short article, I will confine myself to the presentation of some few facts showing the effect of certain forging methods on nickel chrome steel as against the processes known as hydraulic and drop-forging. The information includes some results of personal experience gained in the business of making alloy steel forgings.

A certain operation known as drawing down is performed on most forgings, and it consists of hammering the piece on the square until near finish size, when the operation of rounding up begins. I have noticed that all good smiths follow this method, but have never had one in my employ who knew exactly why this was done, except that it was the quickest way to do the work. It is not uncommon to see a smith, while drawing down, allow the steam-hammer to strike with such force as to all but crush the material, often rending the structure in the case of poorer materials. Others again are timid about drawing down close to finish size before rounding up and begin the latter operation too soon, keeping the piece rolling on the anvil in the endeavor to produce a round section.

It is generally understood that hammering with care and at the proper heat improves steel, and my experience with alloy steels—that have been tested before and after being worked under the hammer—has taught me that the process of drawing down square should endure until finish size is practically reached, and that not until then should the rounding process begin; and then not by rolling around on the anvil indiscriminately, but by taking the corners with comparatively light blows. When drawing down square the blows should as nearly as possible be so gauged as to penetrate to the center and a very little beyond. The unmistakable sign will be that, in the finished piece, the core at the end will protrude a very little; not too much, as that would indicate that excessively powerful blows have been used and a crushing effect produced. As for the smith who draws square and starts to round up long before finish size has been reached, he will inevitably ruin the material.

The result of his handiwork is commonly known as piping. That is, the blows have had the effect of forming an outer shell which is drawn over the core and often separated from it in spots. This procedure leaves a hollow in the end which, in itself, should proclaim the fact that the material was not properly worked. If, on the other hand, the blows are powerful enough to penetrate to the center while working round, instead of square, there are set up continued sidewise shearing effects, shifting or sliding half of the section over the other half; in other words, the operation amounts to nothing more or less than continued violent disruptions, leaving a jagged hole extending through the length of the piece. To give some idea of the importance of the proper gauging of the hammer blows as described, in conjunction with the proper heats, I will name some actual tests in this connection that stand out in my memory.

I had occasion quite some time ago to forge a 600-pound crankshaft billet for Mr. Herreshoff, of whose endeavors you all have heard.

The normal figures of the material used were:

Tensile strength.....	125,000 lbs. per sq. in.
Elastic limit.....	118,000 lbs. per sq. in.
Elongation.....	18 per cent. in 2 inches.
Reduction of area.....	48 per cent.

The billet was hammered by myself and, after being annealed, was ready for machining, having been given no other heat-treatment of any kind.

At the works of the American and British Mfg. Co. test pieces were cut which gave the following figures:

Tensile strength.....	204,000 lbs. per sq. in.
Elastic limit.....	174,200 lbs. per sq. in.
Elongation.....	14 per cent. in 2 inches.
Reduction of area.....	45 per cent.

Against this performance I can place the figures found by Mr. Fay, our president, on testing some crankshafts of the same material, which I had the opportunity of supplying about the same time. The shafts in question were forged by the hydraulic press method—which is eminently a crushing process—then heat-treated twice most carefully, according to the best known methods at the mill where the steel was originally made, and the figures resulting were:

Tensile strength.....	154,400 lbs. per sq. in.
Elastic limit.....	133,300 lbs. per sq. in.
Elongation.....	11 per cent. in 3 inches.
Reduction of area.....	25 per cent.

The hammer method of treating shows an average improvement of 48-1-2 per cent., while the other method in combination with heat-treatment shows the slight average loss of 4 per cent.

Of course, the shafts were not made of the same piece of steel, but I have in my two years' handling of the same material found it to be what may be called uniform. Besides, as stated, the heat-treating was done at the home mill in Germany, where I know them to be very careful and painstaking, and the billet first described was forged here under very adverse and crude conditions. Again, I would not think of putting this in writing if the two years following I had not observed the same condition numberless times.

This seems to show that heat-treatment is valuable as a means of shifting the figures of physical properties to suit desired ends, but does not so much mean an all round improvement, while the material may, without a shadow of a doubt, be improved all round by observing the proper care in heating and hammering. I have further found that a shifting of physical properties may be obtained besides, as readily and nearly as accurately as by different heat-treatments. As for instance: If highest tensile strength and elastic limit with correspondingly low percentage of elongation be desired, I would work the steel at a lower heat than I would if higher figures were desired for elongation or reduction of area. In conclusion I would like to observe that I have seen figures advertised that would not uphold my conclusions, but I have in mind actual tests made by customers who wished to satisfy themselves, and not catalogue figures.

AUTO AS AN AID TO SURGERY.

Upon being called to attend a patient far out in the rural districts, and finding him in immediate need of surgical attention with the nearest hospital 15 miles away and night falling, Dr. W. B. Reid, of Rome, N. Y., was not in a quandary but immediately set to work. The kitchen was converted into an operating room and the ironing board constituted the operating table, but the question of suitable light where nothing but unshaded kerosene lamps were to be had presented a problem until Dr. Reid thought of his auto, which was a Ford runabout. It was backed up until right under the kitchen window, one of the headlights removed and an extra length of rubber tubing attached to the tank, so that the lamp could be brought close to the improvised operating table. In the doctor's opinion, the automobile with its gas tank and lamp proved a strong factor in saving the patient's life, as he happened to have appendicitis, and the disease had already reached such an advanced stage when the doctor was called in that a delay of a few hours would certainly have proved fatal, and any attempt to move the patient, even with the aid of every facility, could only have had the same ending.

*Paper read before the Society of Automobile Engineers at Boston, March 10-11, 1908.

GEAR ARRANGEMENTS AND RATIOS IN AUTOMOBILES

THE fact that in the recent Scottish trials of motor cars no less than 27 per cent., or 22 out of the 81 cars which completed the trials, failed to take their load up all the hills, shows that the calculation of the gears for a car is not yet always understood, says *Engineering* (London). The fact that in the three and four-speed cars the ratio between the top and bottom speeds varied from 2 to 1 to 10 to 1 confirms this view. There were cases, no doubt, in which the failure in hill-climbing was due to defects in the engine, but in the majority of cases it was simply due to the bottom gear not being low enough, and the result could perfectly well have been foretold.

In the present state of knowledge as to motor cars there are ample data to calculate the performance of a car beforehand with as great accuracy as that of most other kinds of machinery, and, therefore, the whole subject of gears should be treated in a scientific manner. In order to calculate the performance of a car under certain specified conditions, we want to know the resistance and tractive effort. The resistance depends on—

1. That due to rolling resistance on the road.
2. That due to the gradient.
3. That due to wind.

At the speeds at which reasonable motorists go, the latter is comparatively small, and for hill-climbing purposes negligible.

The tractive effort depends on—

1. The torque the engine will give.
2. The friction of transmission.
3. The ratio of gear between the engine and back wheels.
4. The diameter of the back wheels.

Although we seldom know all these factors with absolute accuracy, we know them near enough for practical calculations.

Taking the question of the greatest resistance to be overcome first, we may take it for granted that a modern motor ought to be able to take its full load up any hill on a road habitually used for horse traffic. This means that it must take it up short stretches of 1 in 4. The resistance expressed in pounds per ton (2,240 lbs.) due to this gradient is 560 pounds. Rolling resistance will vary a good deal with the surface of the road; but as the surface on steep hills is generally bad, it may reach 100 pounds per ton, making a total tractive force required of 660 pounds per ton.

Assuming that we know the brake horsepower of the engine at the revolutions at which it gives its greatest torque, we can calculate the tractive effort as follows:

$$\text{The torque in inch pounds} = \frac{\text{Brake horsepower} \times 63,024}{\text{Revolutions per minute}}$$

$$\text{The tractive force in pounds per ton is then} = \frac{\text{Torque} \times \text{ratio of gear} \times \text{efficiency of transmission}}{\text{Weight in tons} \times \text{radius of driving wheels in inches}}$$

If there should not be an actual brake test of the engine available, as in the case of a design which has not yet been built, it is usual to estimate the power the engine will give by assuming a torque equivalent to a mean pressure in the cylinder which is estimated by experience. In this case it is simpler to use the assumed mean pressure directly to calculate the tractive force, as follows:

$$\text{Tractive force per ton} = \frac{\text{Cylinder area} \times \text{stroke} \times \text{mean pressure} \times \text{ratio of gear} \times \text{efficiency}}{\text{Circumference of driving wheel} \times 2 \times \text{weight in tons}}$$

all dimensions being in inches. If more than one cylinder, the total area to be taken.

In these formulas the only uncertain factor, if we have a brake test of the engine, is the coefficient of friction of the transmission gear. Absolutely definite experiments on hardened-steel gear wheels running under the varying conditions of motor work

are wanting; but an assumption of a loss of 8 per cent. for each pair of gear wheels through which the power passes corresponds very closely with the actual performance of cars on the road.

If we assume that there is a loss of 8 per cent. of the power transmitted for each pair of gear wheels it goes through, the following will be the efficiencies of the various arrangements. In these some small losses, such as that of the back shaft, when running idle, and that of the universal joint, are omitted. These may vary slightly in different cars, especially that of the universal joint. In a well-designed car, however, this should run practically straight, and all the small losses together should be a negligible amount. The shaft-to-shaft gear box will have an efficiency of 92 per cent on all the speeds, and as the efficiency of the bevel drive is 92 per cent., the efficiency of the whole transmission from the engine to back axle will be 92 per cent. of 92 per cent. = 85 per cent.

The direct-drive gear box, when the direct speed is in use will have an efficiency of 100 per cent., and therefore the efficiency of the whole transmission will be 92 per cent. of 100 per cent. = 92 per cent.

The direct drive-gear box, with any of the indirect speeds in use will have an efficiency of 92 per cent. of 92 per cent. = 85 per cent., and the efficiency of the whole transmission will be 92 per cent. of 85 per cent. = 78 per cent. In the case of a car with side chains there will be the friction of these in addition, which will lower the above efficiencies to about 5 per cent. all around.

In estimating the torque we are likely to get from an engine, we should assume that it is not likely to materially exceed that corresponding to 95 pounds mean pressure, even if the compression, etc., are arranged for getting the greatest possible power; though a few engines, when carefully tuned up, may reach 100 pounds. If, on the other hand, power is sacrificed to other considerations, such as extreme silence, it may be a good deal less.

It is, perhaps, easiest to show the working of a formula by taking a definite instance. Let us assume a car with four cylinders, 3 1-2 × 5 inches, weighing, with passengers, 3,360 pounds, having 32-inch driving wheels, a live axle, and a direct drive on the top speed. Assuming a torque equivalent to 95 pounds mean pressure and 78 per cent. efficiency on low speed, we get a tractive force for gear ratio 1 to 1 of

$$\frac{38.48 \times 5 \times 95 \times 0.78}{100.5 \times 2 \times 1.5} = 47.3 \text{ pounds per ton.}$$

Consequently for a tractive force of 660 pounds we must have gear ratio of

$$\frac{660}{47.3} = 14.0 \text{ to } 1,$$

equivalent to a speed of 8.2 miles an hour at 1,200 revolutions per minute of the engine.

A moderate powered car should probably be able to take its full load up about 1 in 16 on a road with a pretty good surface, which means a tractive force of about 200 pounds per ton, *i. e.*, a ratio of 3.3 between the tractive force on the top and bottom speed. The ratio of gear between the top and bottom speeds will have to be greater than this, owing to the lower efficiency of the low speeds, which is only about 85 per cent. of the top. It will therefore be about 3.9 to 1. In a low-powered car the ratio should be greater than this, as we shall not be so ambitious as to go up hills at our top speed. In a very high-powered car, however, it can be a good deal less. Probably while the low and moderate-powered car wants a ratio of about 4 to 1, the high-powered car should be about 3.5. Experience in these trials showed conclusively that it was merely a matter of either straining a point to gear a car too high for the load it was designed to carry on stiff grades, or of simply guessing at what its gear ratio should be.

LETTERS INTERESTING AND INSTRUCTIVE

FOUR-CYLINDER SEQUENCE OF IGNITION.

Editor THE AUTOMOBILE:

[1,278].—The writer is an owner and amateur driver who reads "The Automobile" with interest each week, and herewith takes the liberty of requesting your decision on the following point in settlement of an argument. I maintain that a four-cylinder motor, four-cycle, with piston numbers 1-4 and 2-3 parallel on a 180 degree crankshaft, must fire either 1-2-4-3 or 1-3-4-2. An automobile factory man tells me that it fires 1-4-3-2, and scouts at my assertion that this firing order is impossible.

My contention is that with piston number one at the beginning of the firing stroke, number four on the same downward stroke, and traveling parallel with number one, will be commencing its intake, and that it can fire only after another cylinder has intervened between it and number one.

My point is that, regardless of arrangement of cams for intake or exhaust, a motor cannot fire 1-4-3-2, and that with such a firing order an entire half stroke with no power application would result in number four, as the piston must, of course, be at the top of the cylinder at the time of firing. Moreover, I contend that such a sequence of firing would result in the same conditions between numbers three and two.

HARRY S. HALL.

New York City.

Your contention is quite correct. It would not be possible for the average four-cylinder automobile engine, which is constructed with the crank-throws in pairs, each pair being 180 degrees apart, to fire in the sequence 1-4-2-3, as cranks Nos. 1 and 4 and 2 and 3 are in the same plane. Counting from the forward cylinder rearward, it would ordinarily be 1-3-2-4, though this is naturally not arbitrary, as any arrangement in which a cylinder having its crank in one plane is followed by a cylinder with its crank in the opposite plane is permissible, and it will be found that many makers set their motors to fire differently in this respect. If the timer were set to spark the cylinders in the sequence 1-4-2-3, only two cylinders would be operative, the sparks for the other two occurring at a time when there was no charge under compression. A canvass of the six-cylinder motors staged at the two New York shows last Fall revealed the fact that practically every one of the permissible sequences of firing was employed on one or another.

SELF-STARTING WITH MAKE-AND-BREAK.

Editor THE AUTOMOBILE:

[1,279].—Can you give me directions for remodeling a make-and-break ignition system so as to make a car self-starting from the seat, if this is practicable with this type of engine? The ignition system, as it is, gives excellent service, the current being supplied by a magneto, but there are times when I am almost disposed to exchange it for a high-tension system, as a means of avoiding a large part of the labor of cranking.

A. W. INGLIS.

Lafayette, Ind.

To make the change is not so simple a matter as might appear, but it can be done without resort to a high-tension system. The first essential, of course, is a battery to supply the current at starting, the magneto being capable of generating current only after the motor is under way. Then, by the provision of switches for connecting the battery and disconnecting the magneto, and some manual device for contacting and separating the make-and-break elements in all the cylinders, it becomes possible to produce the necessary spark for self-starting. As soon as the motor has taken up its cycle and is running regularly, the battery can be switched off and the magneto switched on. Naturally, with the great diversity of make-and-break systems that are in use, the application of these modifications to any given car must be worked out to suit individual conditions and requirements. With at least one system of magneto ignition now applied to a modern car, provision is made for self-starting by hand rotation of the magneto armature, which is for the moment disconnected from the regular drive.

DIRECT-CURRENT DYNAMO FOR IGNITION.

Editor THE AUTOMOBILE:

[1,280].—I have a dynamo, manufactured by the Hillsdale Igniter Company. This dynamo has been used for current supply for a sixteen-horsepower stationary gasoline engine. Please state if the following plan will work successfully?

Place this dynamo so as to drive from the flywheel of a 22-horsepower Buick car. Run two wires to a storage battery, from storage battery to coil and commutator in the ordinary manner. Run two other wires from the dynamo to large lamps with electric globe attachment. What I want to know is, will this work satisfactorily for igniting and lighting purposes? If you think not, will you kindly suggest some plan to do away with storage battery, if possible?

Sumter, S. C.

E. W. MOISE, JR.

The dynamo may be used successfully if it is equipped with a reliable governor to prevent it attaining an excessive speed, which would cause the armature to burn out, and there is a cut-out device placed in the circuit between the generator and the storage battery to prevent the latter from overcoming the voltage of the dynamo and discharging through it when the speed drops. The lamps could not be wired directly from the generator, as the voltage fluctuates so much, due to the extremely irregular speed of an automobile motor that at one moment they would be dim and the next the filaments would burn out, due to the excessive rise, unless the governor held the dynamo speed within permissible limits. The use of a small direct-current generator is not feasible on a car without a storage battery, and there must be a reliable governor to protect the generator and a cut-out to protect the battery. There are outfits of this kind on the market that have been in successful use for a number of years. The reason why such a dynamo can be used with a stationary engine without these protective devices is because of the speed remaining constant.

COMPUTING AN AUTO'S TRACTIVE POWER.

Editor THE AUTOMOBILE:

[1,281].—Will you please favor me with the formula for computing the tractive power of an automobile? W. W. WALLER. Washington, D. C.

The tractive force of a motor-driven vehicle may be computed with the aid of the following formula:

$$T = [a + rf + b(v-3.28)] W \div R$$

in which

T = traction in pounds, this value being the sum of the two calculations for the forward and rear pair of wheels.

W = gross weight in pounds upon the wheels, including the weight of the wheels themselves.

R = radius of the wheels in inches.

r₁ = radius of sprocket, or chain-driving wheel.

f = coefficient of friction for wheel bearing, which will vary according to type.

a = value of rolling constant for wheels with pneumatic tires, this being 0.14 for the latter.

b = value of speed constant for wheels of springed vehicles on an ordinary macadam road in fair condition, this being given as 0.25.

v = velocity of vehicle in feet per second.

Of course, there are other factors to be considered, such as the resistance of the air and the extra pull required by a grade.

The gradient may be taken as 1 in a distance equal to N, and, taking T₁ as the additional traction due to the incline, we have:

$$T_1 = (W + T) \div N$$

In pounds per square foot of the surface presented, the air resistance generated by the car itself alone being considered, as the wind is entirely too variable a factor, this equals the velocity of the car in (miles per hour)², times 0.00492, or, in (feet per second)², times 0.002288. Taking this resistance as P, and writ-

ing T_2 = additional traction due to this resistance, then

$$T_2 = P(R + rf) \div R$$

But the pull of the chain in a car of that type, or the thrust of the gearing, in a shaft-driven car, produces extra pressure on the bearing, equal in a chain-driven car approximately to

$$(T + T_1 + T_2) (R - r) \div R$$

Denoting this additional traction by T_3 , whence

$$T_3 = rf (T + T_1 + T_2) (R - r) \div Rr_1$$

This, then, includes all the factors of resistance to be taken into consideration, and their total may be represented by T_0 , then

$$T_0 = T_1 + T_2 + T_3$$

Example: Find the tractive pull of a car of one ton gross weight, on springs, to travel at 14 miles per hour up a gradient of 1 in 30, weight assumed equally distributed on four pneumatic-tired wheels, driving wheels 36 inches, front wheels 28 inches. Driving sprocket 12 inches, axle 1 1-2 inches diameter, area of car exposed 30 square feet.

The tractive pull of the front axle will be

$$T_0 = T + T_1$$

$$= 51.6 + 39$$

While that of the driving axle will be

$$T_0 = T + T_1 + T_2 + T_3$$

$$= 40.1 + 38.6 + 29 + 1.6$$

which gives the total traction as equivalent to 200 pounds, equal to 7.4 brake horsepower. The foregoing data is from the *Practical Engineer*, London.

ABOUT THE RELIABILITY OF AIR-COOLING.

Editor THE AUTOMOBILE:

[1,282.]—Having read your paper for almost a year now, I am very much interested in the "Letters" on the different subjects that are brought up in each issue. I have a subject which I, with lots of other subscribers, am interested in.

Are there any air-cooled, two-cylinder, four-cycle automobile engines on the market which are as reliable and successful as the same in a water-cooled engine? In brief, is an air-cooled engine as economical or reliable and successful as a water-cooled? In your estimation would an engine air-cooled, with cylinder 5 inches in diameter by 5 1-2 inch stroke, be as efficient as one 3 1-2 inches in diameter by 4-inch stroke? Which size would be the most successful, or would there be any difference in the cooling effect?

Is friction drive on an automobile efficient and successful?

Would solid tires be successful on an automobile equipped with full elliptic springs, or would they be injurious to the car in general? Which kind would give the most and best service, a cushion or solid gum?

WM. McLOY.

Elizabeth, Pa.

There are quite a number of two-cylinder, air-cooled, four-cycle engines on the market, practically all of the horizontal opposed type. Some of them have been used on hundreds of cars that have seen service for several years, from which we should judge they were successful, otherwise they would have been abandoned long since. An air-cooled engine is more economical of fuel than a water-cooled type owing to its greater thermal efficiency, and for this reason it requires more lubricating oil, as it runs much hotter. The difference in lubricating oil consumption is nothing like sufficient to offset the economy in fuel.

If both engines were of exactly the same design and were worked under equally favorable conditions, there should be no appreciable difference in their efficiency. Judging from the fact that, except for racing purposes, air-cooled automobile motors are seldom built to exceed 4 to 4½ inches bore, probably the smaller engine might give better service in unskilled hands and under adverse conditions, but the successful performance of larger air-cooled motors would appear to indicate that there is no reason why the dimensions in question cannot be exceeded. It is more a matter of compression than of size, as the latter would only imply an increase of volume, and the former an increase in the temperature, other things remaining the same.

Judging from the number of cars equipped with a friction drive that are turned out annually, both in this country

and Europe, this type of transmission would appear to be entirely practical for every-day use.

It depends entirely upon the car and the service that is required of it. If excessive speed be not desired and the roads ordinarily traversed are fairly smooth, solid or cushion tires should give satisfaction. The solid rubber tire would probably give the better service. We do not believe there are any cushion tires for automobile use on the market to-day, though some of the solid tires made have a small hole running through the center.

MORE ABOUT BRAKING WITH THE HIGH.

Editor THE AUTOMOBILE:

[1,283.]—Being a constant reader of "The Automobile," I naturally take quite an interest in the "Letters Interesting and Instructive." I notice on page 358, of the March 12 issue, a letter headed the "Practical Side of the Question." In this, the man from Minnesota mentions the use of the motor as a brake, or retarder. He states that the faster the drive wheels turn the motor, the greater will be the resistance, or braking effort, which is very true. Then he says to use the high gear on a very steep grade, and the intermediate on a lesser one, which is entirely erroneous, as on the high gear the motor runs slower than on any of the others, and hence gives the least braking effort.

On the high gear, the motor turns from 2 1-2 to 4 1-2 times, according to the design of the car, while the rear wheels are turning once, while on the low gear the motor turns 9 to 11 times, and more, also varying with the design. Which will produce the greatest braking effort?

C. E. CARR.

Frederika.

Naturally, the low gear will always give the greatest amount of resistance in the motor when the latter is being driven by the road wheels, as in coasting down a hill with the ignition, or fuel, entirely cut off. Evidently, Dr. Hard got the thing confused in his own mind, and several other subscribers have already called attention to the matter. On anything but very stiff grades, however, it is customary with the general run of drivers not to drop from the high gear when coasting, the foot-brake being relied upon to supply whatever retarding effect is required in excess of that provided by the motor.

FOUR-CYCLING OF TWO-CYCLE MOTORS.

Editor THE AUTOMOBILE:

[1,284.]—I have a three-cylinder two-cycle boat engine which has developed a peculiar tendency to "four-cycle"—that is, for the explosions in each cylinder to occur on every other instead of on every down stroke. I had never heard of this phenomenon until I experienced it with my motor, but several friends tell me that it is a well-known effect, which never has been explained satisfactorily. This seems unreasonable, because if a thing cannot be explained or is not understood, it would appear impossible to rectify the fault it may occasion, yet I am not altogether prepared to believe that the engine in question must continue in its erratic working, for until recently it operated perfectly. The four-cycling occurs chiefly at high speeds and seems especially prone to occur at high speeds under light loads, as when the engine races through the propeller being lifted out of the water in a rough sea. The motor is an ordinary three-port type, the product of an amateur builder, but it possesses no "freak" elements in its design and has given a great deal of good service. Any information you can give on the subject, and especially anything that will directly help the situation with which I am confronted, will be appreciated.

Sandusky, O.

C. E. WATKINS.

It is a fact that at one period in the development of two-cycle motors there was a good deal said about their mysterious "four-cycling" under some conditions, and, for anything that we would be able to prove to the contrary, it is entirely possible that some of the factors in this phenomenon may be unascertained. Nevertheless, we know positively that in a majority of such cases of "four-cycling" it is due to a comparatively simple set of causes, the existence of which must readily appear from a consideration of the functioning of a two-cycle motor. In these, to begin with, unless they are of unusual type, the displacement of the exhaust gases subsequent to each power stroke is effected almost wholly by the incoming charge, so that no more exhaust goes out than charge comes in. The result of this is that under

extreme throttled conditions, usually coincident with light load, there is an enormous retention of exhaust gases, with which only a small percentage of fresh charge is intermixed. Consequently, if this condition is made still more unfavorable to correct operation by some derangement of the mixture, ignition, which perhaps occurs none too readily anyway under the circumstances, may fail altogether. However, as the motor continues to turn over, a portion of a charge thus left unexploded is in due time exhausted as though it had exploded, with the simultaneous access of another increment of fresh mixture. This may improve the cylinder contents to the point of ignitability, and, as long as the condition persists, the motor will thus fire on alternate strokes—"four-cycling." From all of which you will see that carbureter trouble is implied—probably some maladjustment calculated to set up the peculiar balance necessary to produce the effect you note. We shall be interested to know how you make out, and to hear from others who may have had experiences along this line.

GEAR RATIOS OF A 45-HORSEPOWER CAR.

Editor THE AUTOMOBILE:

[1,285.]—Referring to letter No. 1,251, of "Letters Interesting and Instructive," in your current number, is your reply correct? My impression is that the gear ratio in the bevel geared drive is either 3 to 1 or 2 1-2 to 1, this being optional, and the former being the one that is put in unless the other is specially specified.

The additional reduction in the gearcase of the Pierce-Arrow a few years ago was 1 to 2 for the intermediate, 1 to 3:54 for the low, and 1 to 4:56 for the reverse.

Taking the ratio of 3 to 1 in the rear axle, we would have the following ratios between the engine and the hind wheels:

On high gear.....	3 to 1
On intermediate gear.....	6 to 1
On low gear.....	10:62 to 1
On reverse.....	13:68 to 1

and without being positive, my impression is that their present car is not very different from this. In lower powered cars three to one is quite usual in the rear axle, and doubling this for intermediate, and again doubling for low is, I think, quite customary. An improvement on this is to raise the speed on the intermediate so as to get about 3 to 1 on high, 5 to 1 on intermediate, and 12 to 1 on low. The design of the sliding gear transmission is such that of necessity the reverse must be somewhat lower in speed than the low speed ahead.

"GASOLINE SAL."

New York.

Probably the makers misunderstood our question when supplying the information, as what you state concerning the gear ratio is correct for the average car. We will let the makers answer.

HOW MANY DROPS OF OIL PER MINUTE?

Editor THE AUTOMOBILE:

[1,286.]—Please let me know, through "Letters Interesting and Instructive," how many drops of oil per minute each cylinder of my double opposed 4 9-16 by 5-inch horizontal engine should have.

Portsmouth, O.

SUBSCRIBER.

This is a matter that can only be determined exactly by experimenting a little, as different motors of the same make will frequently differ in this respect. Try 18 to 20 drops per minute for each, in order to be certain of having sufficient. If there is much smoke in evidence, cut the quantity down until it ceases to appear. Note the quantity of oil in the crankcase before beginning the experiment, and if no sign of smoke appears with the rate given above, run the motor under average normal load for 15 minutes steadily. Then examine the quantity of oil left in the crankcase, and, if unduly diminished, or increased, regulate the supply accordingly. A well-designed motor of this size, in good condition, should run smoothly on 10-12 drops per cylinder per minute, but it is better to go over, rather than under, the quantity, and it is quite a general practise with drivers to feed all the oil possible short of causing smoke. This is not a particularly economical procedure, but as the quantity of lubricating oil required to keep the average modern car in good running order is small under ordinarily favorable conditions, it is generally considered far better to use an excess.

A FURTHER DISCUSSION OF MOTOR EFFICIENCY.

Editor THE AUTOMOBILE:

[1,287.]—In your reply to Mr. Frost (1,206) and also to Mr. Pierson's statements (1,235) you claim that the power and efficiency of a gas engine are increased by lengthening the stroke. In regard to the power, I agree with you that there is an increase by lengthening the stroke, but there is not the same gain as obtained by increasing the bore for the same piston displacement increase.

Now as to the efficiency. Efficiency, in the first place, is the ratio of the heat converted into mechanical work to the total amount which enters the engine. Of course, the efficiency depends on the expansion of the charge, as stated by Mr. Pierson, but also on the heat loss to cylinder wall. Therefore, the most efficient motor is the one which not only gives the largest expansion or piston displacement for a given volume of charge, but also the one that does this with the least cylinder wall area. These two requirements cannot be fulfilled by a long stroke motor (i.e., a larger stroke than bore), but can be had with a short stroke motor (larger bore than stroke) of the proper proportions.

You also state that short-stroke automobile motors exhaust at terminal pressure as high as forty or fifty pounds, while stationary motors of good design get as low as ten or fifteen pounds terminal pressure. The utilization of the difference in pressure mentioned makes for greater efficiency, and is brought about directly by the stroke. Now this conveys the impression that the motor efficiency is greater with long-stroke, low terminal exhaust motors. Whereas, if the same expansion or piston displacement (with the same charge) were used on a larger bore than stroke motor, the efficiency would still be greater, even though the terminal pressure were higher (due to less cylinder wall heat loss), as reduction of terminal pressure by larger cylinder wall area will not increase efficiency, but lower it. The average stationary motor is also cooler.

We have all noticed the increase in motors using valves direct in the head, also the gain in power, flexibility and efficiency at slow and medium speed over the old style T-shaped chamber.

The gain in this type of motor is on account of a spherical combustion chamber, with reduced cylinder wall heat loss and charge reduction through heating on the suction stroke, as they have less cylinder wall area for a given volume. Now, if there is quite a noticeable gain in reduction of compression chamber area (for a given volume), should there not be a gain in reducing cylinder wall area for a given piston displacement as in using a larger bore than stroke motor in the proper proportions? The conclusions at which I have arrived are that the most efficient motor is the one with valves in the head, larger bore than stroke, high compression with fuel injection and expansion to nearly atmospheric.

With fuel injection, the compression can be increased to as high as five hundred pounds, as in the Diesel engine, without pre-ignition, as fuel is not injected until the end of the compression stroke or center. Again, if this feature should be applied to an automobile motor, it would be very beneficial when running on a throttle charge with the possibility of increased power for hill climbing, when desired, at slightly reduced efficiency. Of course, it is not necessary to increase the compression to five hundred pounds to gain in efficiency; one hundred and fifty pounds, or even one hundred and twenty-five would be a practical increase.

Philadelphia, Pa.

W. E. HAUPT.

SUCCESSFUL EXPERIMENTS WITH DEAD CELLS.

Editor THE AUTOMOBILE:

[1,288.]—Referring to Letter 1,233, in regard to rejuvenating dry cells and your answer thereto, we are not seeking to advertise our method of doing this, but, as a matter of "common knowledge" that certain alkaline solutions do as you say, there are others more adapted for still better results. As to cells being absolutely dead, twelve of them would not move a volt-ammeter, and for the same reason three of them are known to have been cast aside five years ago. It will be remembered, though, that whatever the age, the zinc must be in good condition. And when thus thoroughly treated, which requires but a few minutes, and at a cost of a few cents, it is certainly without a doubt profitable, for the additional period of activity will exceed more than half the original life.

SELFE & WHITEFORD.

Darlington, Md.

HOW TO RENEW TOP LININGS.

Editor THE AUTOMOBILE:

[1,289.]—I notice you want an answer to inquiry No. 1,208. I had a customer bring me a repair job of that kind, and it puzzled me some before I thought of a scheme to remedy it. I bought a can of dull black "Jap-A-Lac," thinned this out with turpentine, and gave the cloth lining one coat of the same, covering the surface all over, let that dry and gave a second. This made it look almost as good as new. I hope this will help Mr. Fay out.

Corsicana, Texas.

CLARENCE THOMAS (Auto Doctor).

Side Elevation of 1908 Weigel Racing Car, Which Will Compete in the French Grand Prix.

ABOUT BRITISH CONTESTANTS FOR THE GRAND PRIX RACE

LONDON, March 20.—The number of British firms who are to try their fortune at Dieppe in July is now finally reduced to two. There is no prospect of the Napiers competing on account of the detachable wheel dispute, while nothing has been heard of the Ariel cars, of which the first was shown at last Olympia. With regard to the actual entries, the Austin cars are still under construction, but will probably be on the road by the beginning of April. The engines have six-cylinders 127 mm. by 140 mm., and the gearbox is provided with four speeds, the third being direct drive, with the fourth geared exceptionally high to enable fast work to be done on favorable grades. Two of the cars have chain transmission, the third and also the spare car having live axles. Although this is the first appearance of the Austin in road racing events, its designers have had long experience and before the formation of the present concern, made the Wolseley racers of 1905 and 1906.

The Weigel cars made their first appearance in last year's Grand Prix, and though they did not meet with much success, owing mainly to the type of detachable rims employed, they attracted much attention on account of the fact that nothing but parts of the standard 40-horsepower touring car were used. The engines were two four-cylinder units coupled together.

This year, however, a special car has been designed throughout and it is particularly remarkable for the lowness of the

center of gravity. The engine has four cylinders 155 mm. bore and 175 mm. stroke, the four cylinders being cast in one piece. The valves are of unusually large size and are set to open directly into the combustion chamber at an angle of 45 degrees to the vertical. They are operated by a camshaft running above the cylinders. The pistons are of cast steel of very light section and the connecting rod bearings are of phosphor bronze with white metal linings. As regards lubrication the oil is forced by a pump through jets directly below each crank and the spray effectually lubricates the parts without excess of oil being able to reach the combustion chamber. The oil drains back to a pump at the front of the crankcase from which the pump is supplied. Two ignitions are employed, high tension magneto for normal running and battery and coil as a standby. A cone clutch replaces the flat plate type employed last year, and a three-speed gearbox conveys the power to the rear live axle. The frame, of channel steel, is kept low down, except at the rear, where it sweeps up to give the clearance for the back axle and to provide a seat for the driver, who is in this way only 28 inches from the ground. Detachable rims are used and the spares can be conveniently arranged round the fuel tank. These cars are practically completed, and will be put through extensive trials at Brooklands track, before being tried out on official circuit at Dieppe.

Sectional End and Side Views of Four-cylinder Motor Which Will Be the Power Equipment of the Weigel Racer.

Model 5, the Latest Holsman Type of High-wheeled Auto.

THE owner of a Holsman car recently paid a visit to the factory of the Holsman Automobile Company at Chicago, for the purpose of investigating the new No. 5 model which the company is just putting on the market and has penned the following description of what he saw in that well-conducted plant:

"I expected to see a nice little runabout that would be serviceable and reasonable in price, and to say that I was agreeably surprised is putting it very mildly. I think this latest creation of their skilled mechanics will not be equaled for a long time to come. The lines on which it is built are artistic in every sense of the word, and the finish of every part speaks of good workmanship and good material.

"After arriving at Chicago, I first visited the Holsman general offices. These occupy the entire south end of the fourth floor of the Monadnock building. This building is said to be the largest office building in the world. Enough people go and come from this building every day to populate a city. I found this department of the Holsman Automobile Company a veritable bee-hive of business, and the whole place seemed alive with activity. After being most cordially received and shown the greatest consideration, I was given a letter admitting me to their factory. This document, I found, not only admitted me to their factory, but brought me the kindest attention from everyone in this great and busy place, which I understand is the largest producer in the world of the carriage or buggy type of automobiles, that truly American product.

"After viewing the No. 5 machine referred to above, I was shown first the wonderful motor which, connected with the countershaft and stripped of all other parts, constitutes the entire power plant for the different models of their machines. I was also very generously provided with photographs of the interior of the factory, along with one of the motor and countershaft. I consider this the simplest, lightest and most skillful power transmission for automobiles that was ever designed. The superintendent assured me that this was the secret of making a light machine. He also assured me that a light machine is a durable one.

I believe this to be a fact, because it is in line with reason and common sense that extra weight in an automobile makes traction greater, uses more fuel and soon racks it to pieces.

"I then visited the machine shop on the first floor. Every inch of space in this wonderful machine shop is utilized with metal-working machinery. I believe this is the busiest place and can furnish a larger variety of noises than any other place I ever visited in my life. Here emery wheels by the dozens are spitting fire, blacksmiths are forging red-hot irons, automatic saws are slowly cutting through large shafts of steel, also a hundred lathes are turning, groaning and screeching with turning off long, beautiful curls of metal from the parts which are being shaped. Hundreds of busy men are grinding, polishing, boring and fitting as if their lives depended upon it. This wonderful place with its hundreds of peculiar noises and clatter goes steadily on, night and day, for the plant is running to the extreme limit of its capacity.

"The motor assembling department on the next floor is where the most skilled mechanics in this branch of the work assemble and fit to the one-thousandth of an inch the various articles of bronze, steel and iron which go to make up the motor.

"The vehicle assembling room, illustrated in one of the photographs, is a busy place indeed. Here scores of men take the parts made in the machine shop and fit them together into the completed vehicle. Every man seems to know just what to do and how to do it with the least possible expenditure of energy.

"After being shown through this department, I was next taken to the testing room. This is a separate building. In this place a large number of motors are running at the same time at the rate of 1,200 to 1,500 revolutions per minute. Each motor is driving a large fan, which represents a certain amount of horsepower. This place is so filled with the hum of motors, the whir of fans and the whirling of air that one is reminded of a Kansas cyclone.

"The trimming room is on the top floor. Here the humming noise of the sewing machines is about all there is to be heard. In this department leather is cut, formed and stitched, the but-

Holsman Motor and Countershaft, which Constitutes Power Plant and Drive.

An Aisle in the Machine Shop of the Holsman Factory.

Corner in the Well-lighted Motor Assembly Room.

tons put into place, the finish put to artistic designs of backs and seats with the most wonderful skill. Here common everyday articles such as leather, wool, hair and cloth are fashioned into tops of perfect artistic beauty.

"The paint shop is also on this floor. A hundred or more vehicles are lined up and being painted. A blind man could easily tell when he was in this paint shop by the striking odor of turpentine and paints. These subtle artists are all plying their trade quietly but with great diligence. A person who has never seen it can never imagine the great change which takes place in the general appearance of an automobile after these tradesmen have given it their magic touch.

"We next visited the crating department. Here the men drive nails all day long, making the framework to protect the vehicles from damage during transit. The cars are taken apart, covered with cloth, and very carefully boxed. One vehicle was being prepared for shipment to India. A complete little house was being built for it and lined with waterproof roofing paper. Vehicles which go to this far-away country must be protected from moisture as well as from damage in transit. After crating is completed a large elevator drops the crates to the door of the cars which are waiting on the private track, and this track connects with every railroad and transportation line in the world. I have seen factories in all parts of the country, but I have never been so impressed with the system, workmanship, exactness of detail, wonderful management and large amount of work done, as in this up-to-date automobile factory, and that is saying a great deal, as it is a matter of common knowledge that the adoption of systematic methods of manufacturing has been carried to a much greater extent in the construction of American automobiles than is the case in almost any other line of industry which involves the use of such a vast amount of intricate and expensive metal-working machinery of every possible type."

CONTINENTAL MOTOR WORKS TO ENLARGE.

MUSKEGON, MICH., March 30.—If evidence to support the claim that Michigan automobile interests felt the effect of the recent slump to a comparatively small extent were needed, the fact that the Continental Motor Manufacturing Company, of this city, has just let contracts for the erection of a new machine shop to measure 110 by 175 feet, to be completed by June 1 next, should be sufficient to show that the depression has not deterred this concern from going ahead with what appears to be much-needed expansion. The building is to be one story high, of the saw-tooth roof type, and of absolutely fireproof construction throughout. The present machine-tool equipment will be housed in the new building and extensive additions and improvements will be made in the shape of automatic machine tools.

A new motor-testing house, which is also fireproof, has just been added to the facilities of the Continental plant. It is claimed to be the largest and best-equipped of its kind in the country, as its permanent equipment provides a capacity for testing 50 motors at a time. The proposed improvement, *i. e.*, the large new machine shop, is the fourth addition that the Continental company has found necessary during the two years that it has been located in Muskegon, and the reason for making it just at this time is said to be because of the fact that orders now in hand are sufficient to keep the entire plant busy for many months.

The company is now making a very complete line of motors for touring cars, commercial vehicles and special taxicab and marine types, in addition to which it has been found necessary to largely increase their output owing to the demand for motors of the automobile type for various industrial applications, such as electric lighting, ditching machines, gang-plows, lawn-mowers, etc., owing to their compactness, and a large share of this demand has been filled by Continental motors.

Where the Paint is Applied and the Finish Perfected.

LONDONERS TAKE TO AUTOBUS VERY KINDLY

LONDON, March 23.—If any one had had the temerity to make the prophesy ten years ago, or even five, that to-day would see the streets of the world's metropolis full of machine-driven 'buses, he would have been derided. But then, no Britisher would have ever dreamed of making such an assertion. The old-time arks with their spavined and underfed motive power, which had to exert far more than the unit of energy which Watts has perpetuated, to get their load under way, were revered far too highly as a time-honored institution to be treated thus lightly. What would London be without its fleet of 'buses? Though the horse has been relegated to the limbo of forgotten things that the automobile has been responsible for banishing, and his place has been taken by a vehicle with a far greater capacity, still there seem to be more 'buses in London's streets to-day than ever there were.

From one point of view, the change has been merely one from flesh and blood to iron and steel—the smell of the horse and his stable have been bartered for the odor of petrol and lubricants, and the vast number of petrol-driven 'buses that now course the streets have given the London atmosphere another and a decidedly distinctive flavor. It had enough of its own before the passing of the horse, and whether this new

one is the result of a chemical combination of exhaust gases from petrol motors with those that already existed, or is merely a blend in which the characteristic odor of half-baked petroleum products is uppermost, is a question for the connoisseur to decide. Certain it is that the question is one that has agitated London and Londoners not a little. As a matter of fact, at one time it appeared as if an ultimatum would be issued by the authorities that either the smell or the 'buses would have to go.

It is a most peculiar thing about the average London dweller that he never asked to have the atmosphere cleared of any of the many and sundry half-burnt products of combustion from other sources that continually fill it, nor could he distinguish any particular source of noise that afflicted his hearing unduly among the many that comprise the hum and roar of London

streets until the advent of the petrol 'buses. Then it suddenly became apparent that the smoke from the exhaust of hundreds of big cars and the clash of their sliding gears were things not to be grouped in the same class with similar annoyances, and were, consequently, not to be tolerated.

Like every other innovation, the petrol 'bus had to fight its way into favor, and the rapidity with which it has done this is quite in keeping with the advance that it marks over its predecessor, for the Londoner has already come to accept the power-driven 'bus and regard it as a hallowed institution, native to the soil—much as he did the trio of straining horses and the mountain of creaking, swaying carriage work they pulled. There are now some seven to eight hundred motor 'buses in London, of which more than 600 are owned and operated by two large companies, the London General and the Vanguard. Like everything else, the motor 'bus was

A View of the Strand, Showing the Passing of the Horse 'Bus.

made the plaything of the stock speculator in its earlier days and, as a result, the Vanguard Company is overburdened with watered shares. Though the statement has been contradicted and denied as often as it has been announced in the press, it is known definitely that there is a movement afoot to amalgamate these two concerns into one corporation—a step that cannot fail to have a far-reaching and beneficial effect upon London's surface transport facilities, which are not of the best by any means.

TEN YEARS AGO FIRST WINTON WAS SOLD IN CLEVELAND

TEN years ago—to be exact, Tuesday, March 24, 1898—the Winton Motor Carriage Company made its first sale of a motor carriage, and the sale was traceable directly to an advertisement.

On that morning, Robert Allison, a mechanical engineer of Port Carbon, Pa., called at the little Winton factory and asked if he might see one of the "horseless carriages" which had been advertised. "Surely," responded Mr. Winton. "And I'll give you a ride in it, too, if you like."

Mr. Winton's suggestion pleased the caller immensely, for he had just visited two places in other States where "horseless carriages" were said to be in process of making, but had been received coldly and denied even a peep at the mysterious machines.

The Winton car was scrutinized critically for an hour or more. Then a journey several miles across town was undertaken, one or two stops being made while Mr. Allison called out mechanical engineers, friends of his, to pass judgment upon the machine. Early in the afternoon, being assured that a machine could be ready for shipment to him within a week, Mr. Allison signed

his name to an order and became the first American purchaser of an American-made, standard-model, self-propelled road wagon.

H. C. Sargeant, of Westfield, N. J., also a mechanical engineer, visited the plant that same afternoon and was surprised to find there his friend, Allison. Mr. Sargeant absorbed a great deal of Allison's enthusiasm and followed his lead, buying car No. 2. Thus on its first day of actual business, the Winton Company sold two machines.

The first batch of cars consisted of four machines, one of which Mr. Winton himself used. Only one of the four now remained, and this car was bought by John Moody, a manufacturer of Hamilton, Ont. This sale, made two days after the Allison and Sargeant sales, completed the output and gave the struggling Winton Company the moral and financial encouragement which ultimately resulted in the establishment of the greatest exclusive automobile factory in the world. Mr. Allison's car was shipped from Cleveland promptly on April 1. A week later the vehicles for Messrs. Sargeant and Moody were on the railroad cars.

AUTOMOBILE HAS BECOME A NECESSITY IN EVERYDAY LIFE

"WE are reaping the reward of faith," said Benjamin Briscoe, in discussing the present marked revival in the automobile business. The Maxwell factory has not laid off a man all season, but, on the contrary, has been working to capacity during the past few months of business depression, while other factories either closed down entirely or worked a short force.

"That we not only did not curtail our output, but actually increased it over our original schedule, was due to our unbounded faith in the stability of the country and of the automobile industry—at least that part of it engaged in the production of moderate priced cars—and that we have been unable to accumulate a single car against the heavy spring demand is proof that our optimism was justified. Ordinarily, we plan to produce several hundred cars over the delivery demands in the months from November to March, but this season we have been hard pressed to keep up with current orders.

"At the time when the breaking of a few banks threw some of our competitors into a fit, and pessimism was rife, I looked the situation over and came to the conclusion that that was our time to make a ten-strike. I was certain of the ultimate recovery of trade and I believed the period of depression would be short-lived. On those grounds we determined to push work in

all four plants so as to have Maxwell cars ready for delivery early—a most important advantage to be gained over those of our competitors who were standing idle or undecided as to what to do. Then I figured that, as almost all other factories had canceled orders for material—indicating that they would turn out only about half as many cars as we had previously estimated they would—there would be still more room—and more demand—for Maxwells. So we increased our output 25 per cent.

"Our faith is being rewarded in a way that surpasses our fondest hopes. Our sales since August 1 show an increase of 42 per cent. over those of the same period last year and those of January, February and March surpass last year by 50 per cent. When I say sales, I mean deliveries—not merely orders. Seems as if this showing gives the lie to the too general supposition that the automobile industry is to suffer more than other branches of commerce from the temporary depression. For my part I predict that the total business of 1908 will exceed that of 1907 by greater or as great a margin as that of 1907 was in excess of the year before. In other words, I believe the automobile has become a necessity in the everyday life of every successful business and professional man, and if any additional evidence of this were necessary the constantly increasing sales should be sufficient."

FARMERS GENERALLY ARE NOT HOSTILE TO AUTOMOBILES

IT has become the fashion among some writers and not a few autoists to credit the farmer with a feeling of animosity toward the automobile. In the New York to Paris race some of the drivers complained that the "peasants," as they called them, charged exorbitant rates for the assistance rendered the snow-bound machines.

G. B. Sharpe, publicity manager for the Studebaker, stated in a recent interview that his own experience with the Studebaker Army dispatch car that made the run from New York to Fort Leavenworth, Kansas, most of the way over the same route, would lead him to an entirely different conclusion regarding the farmer's attitude. Said Mr. Sharpe:

"The farmers helped us dig through snowdrifts and brought their horses out to assist us through drifted roads where or-

dinarily a farmer would not think of asking his horses to go, and, considering the service rendered, I do not believe their charges were exorbitant. Furthermore many of them exhibited an enthusiasm that was, to say the least, cheering to our tired drivers and crew. All along the line our drivers reported the same kind of treatment, and nowhere were they more enthusiastically welcomed than in the great farming State of Kansas. I believe that almost invariably if the motorist will regard the farmer as a friend instead of an enemy and accord him the gentlemanly treatment which is his due the farmer will be only too glad to meet the motorist on the same footing. The selfishness of the few who thought that superior speed and power gave them the earth and all that was on it, has been the mainspring of the farmer's dislike for the automobilists as a class."

Two Ships of the Desert

Mr. Richard Croker

Pacha Hassan. H.H. Prince Aziz

An Egyptian Village

A Native Chauffeur

Soudan Police

MR. GLIDDEN IN THE LAND OF THE PHARAOHS.

February 27, Mr. and Mrs. Charles J. Glidden completed their tour of the land of the Pharaohs, which was started on February 13. The roads of Egypt are limited but good, the longest continuous drive being 60 miles, from a point on the desert, east of Cairo, through that city to the Pyramids.

On completing his tour of Egypt, Mr. Glidden, having obtained permission from the Sultan of Turkey, proceeded to Palestine. He cables from Jerusalem that it was impossible for him to land his Napier car at Joppa, and he was obliged to proceed farther north to the port of Haifa. From that point he drove by way of Athlit, Caesarea and Joppa to Jerusalem. It was the first automobile ever seen on that route, and caused much excitement among the natives. Mr. Glidden's total mileage to March 18, on his world's tour, was 43,137 in 37 countries visited. From Jerusalem Mr. Glidden drives his car to the sea of Galilee, returning to Haifa, and sends his car from there by train to Damascus, 176 miles, driving to several places out of Damascus, and finally reaching Beirut via Balbec.

The next country visited will be Greece, followed by Montenegro, Dalmatia, Croatia, to Trieste, crossing the Dolomites, and reaching Paris early in May and London about May 15.

"Dixie" Leading "General" in 41-2-Knot Race at Palm Beach, Fla.—Finish Was Two Seconds Apart.

THE PALM BEACH MOTOR BOAT RACES.

HOW broad in scope has become the work being done for motorists by the American Automobile Association is illustrated by the information for tourists now in hand and being compiled. Speaking of the work of the touring board, and how the fact of the A. A. A. being truly national in character enabled it to do what none other can, Chairman Hower says:

"It must be remembered that the touring board, besides the chairman and Secretary Lewis, has ninety members, located in as many sections of the country. During the past year, the local clubs of the American Automobile Association have been laying out routes, radiating from their respective cities, copies of which have been forwarded to the touring board office in Buffalo and by the touring board arranged in files, from which copies can be readily made on the application of members. This information could not be gathered by an individual, nor by an individual club, at any cost, but only by a body such as the American Automobile Association, by reason of the clubs affiliated with it, numbering now 126.

home. While they were rearing its walls of sea-shells and mortar, Michelangelo was building the famous dome of St. Peter's in Rome. Back across the Atlantic, the forefathers of Washington and Lincoln were living in England, unmindful of the unborn descendants who were to make their names imperishably illustrious, but in spite of their labors the religious peace that they sought came not. Instead came Spanish adventurers, who interfered with their form of worship and at length butchered them. From 1565 to 1580 the house was used as a home for the monks, chauffeur and the chauffeur's personal expenses. These arrangements can be made at the touring board offices in Buffalo, or at the secretary's office in New York, and the car selected will be at the place in Europe designated, at the time named. The touring board files contain information of all description, such as import duties, car and driver's licenses, together with routes, descriptions and conditions of roads. Arrangements have been made with the American Express Company covering the shipment of automobiles to any foreign port at a rate lower than can be obtained by any one other than A. A. A. members. All of this assistance is absolutely free to members."

E. P. CHALFANT TAKES CHARGE OF LICENSED ASSOCIATION

AT a meeting of the executive committee of the Association of Licensed Automobile Manufacturers, at the New York City, Tuesday, March 21, specially called to take action in the

THE OLDEST HOUSE IN THE UNITED STATES.

A celebrated French author, referring to a very aged person, remarked that death seemed to have forgotten him and passed him by. In like manner it may be said that the furies of fire, frost and blistering sun seem to have forgotten an old house that stands in St. Augustine, Fla. It is the oldest house in the United States—built 345 years ago, in 1565—yet, with a new roof and new siding, it stands there to-day like a sturdy bit of the sixteenth century carried over into the twentieth. The house was built by French Huguenot emigrants, who came to a new world to seek the religious peace that they could not find at

mobile Manufacturers. Prior to entering the automobile field, Mr. Chalfant was assistant to the president and head of the sales department of the International Tire Company. His experience in the sales end of the industry dates back some fifteen years.

When seen after the meeting to-day Mr. Chalfant said: "I have been very much interested in the work and policies of the Association ever since I became a board member, nearly four years ago. Although I have not held an executive position, I have been in close touch with things relating to the Association and the Selden patent. The general policy inaugurated by the members of the Association will not be materially changed, and I believe that the near future will develop some interesting facts as the result of the close relationship that the members have with the Association."

PEOPLE WHOSE OPINIONS ARE WORTH WHILE.

S. H. Mora, Mora Motor Car Co., Newark, N. Y.—"We are firm believers in the six-cylinder proposition's future. Our agents seem to look at it as we do; for our orders are two to one for the 'sixes' as compared with the 'fours.' To my mind the aim of construction has been to attain flexibility equal to that of the steam car. Two cylinder cars supplanted 'one lungers' and the double cylinder gave way to the quadruple. So I believe that the 'six' will supplant the 'four' at the high price end of the business. Continuously applied power is an advantage not to be disputed. We have tried to produce as light a car as is consistent with strength and average power. We are satisfied with the progress we are making; for the engine and transmission of our 'six' weigh but 15 pounds more than those of our 'four'."

H. O. Smith, Premier Motor Car Co., Indianapolis.—"Our trade opening in Indianapolis scored a far greater success than ever the most sanguine expected. The selling results of the week showed fully three cars purchased to every one sold in any week in March 1907, or, putting it in another way, the sales were equal to the business done in any three weeks in March last year. The carnival was on a more elaborate scale than the initial one last season. Among the features were various competitions of the obstacle order to show the control of the cars. We also had a successful hill climb. I was much disappointed in not getting our Premier to Savannah, but we could not spare our factory men to look after it. We shall have two or three cars in the Glidden Tour."

G. V. Rogers, Mitchell Motor Car Co., Racine Junction, Wis.—"The expansion of our factory is continuing. We have broken ground for three new concrete buildings which will bring our total floor space up to 14 acres. One is 600 by 130 feet for a paint shop; a second, 130 by 160 feet, for a shipping department; and the third, 100 by 130 feet, an addition to our main machine shop. We are making great preparations for our big reunion of agents on August 27, 28, and 29. The entertainments will run from prize fights up through the whole gamut of motor car functions. We will start day and night shifts on April 1. Business in the West is booming."

W. H. Van Dervoort, Moline Automobile Co., Moline, Ill.—"The selling season in the West has opened a month earlier than last. The demands for cars are coming to us in larger quantities than in March, 1907. This is especially true of the small towns, which everywhere have had a brisk trade. I have an idea that this is explained by the fact that the second hand cars and machines taken in exchange have been dumped into the big cities and have interfered more with the sale of new cars than have the few exchanges in the little places."

R. M. Owen, of R. M. Owen & Co., Selling Agents of the Reo.—"Things are going smoothly enough at the factory at Lansing to admit of Mr. Olds continuing his sojourn at Florida to this late spring date. Speaking as selling agent I can say that actual sales of Reos to date are ahead of last year and you must not forget how big a year 1907 was for the Reo."

C. F. Wyckoff, of Wyckoff, Church & Partridge, Eastern Selling Agents for the Stearns.—"I have just returned from a visit to the factory at Cleveland, where I found the production progressing satisfactorily. While West I stopped at Chicago. The agent there reported that Stearns sales were double those of last year to date."

Milton J. Budlong, President Packard Motor Car Co., of New York.—"I am a newcomer to the Packard fold. I am amazed at the vogue the car has. Close to 1,000 cars of the 1908 output have already been shipped from the factory."

A. A. A. RACING BOARD IN SESSION.

A meeting of the A. A. A. Racing Board is to-day in session at the Association's headquarters, 437 Fifth avenue, New York City. Rules and the Vanderbilt race are under discussion.

PULLMAN IS PHILA.—SAVANNAH WINNER.

PHILADELPHIA, March 30.—At a meeting of the Contest committee of the Quaker City Motor Club, last Saturday afternoon, the protest of the Pullman people against the awarding of the honors in the recent race to Savannah to the Studebaker was sustained. The latter car arrived at the finish first by nearly 24 hours and came in for a great reception, while the Pullman was almost lost in the shuffle. The crew of the latter, however, proved that they had adhered to the course laid out before the start, while the Studebaker people, who were miles behind, left the course and cut across country to dodge the bad going; that they had lived up to the agreed-upon conditions regarding drivers staying with their cars, while the Studebaker sent in relays and shipped the worn-out man ahead by rail to get him in shape for the next relay; that their observer had stayed with the car, while the Studebaker observer was absent from the car on several occasions. In view of this testimony, which the Studebakerites failed to successfully meet, the committee spent little time in coming to a decision.

Banquet at York to the Pullmanites.

YORK, PA., April 1.—Over three hundred persons attended a banquet in this city on Saturday night, which was given by the employees of the York Motor Car Company in honor of Paul Gillette, Newark; G. W. Daley, Philadelphia; Robert Morton, York; the crew of the Pullman automobile, which won the race from Philadelphia to Savannah, and James A. Kline, general manager of the York Motor Car Company. Many of the most prominent autoists from this section of the country were present, and the function was enjoyed by all who participated. The toastmaster was W. W. Williams.

The banquet tables were arranged in a letter "P," and the dining hall was decorated with large American flags and bunting. During the evening Manager Kline read a telegram he received from the Quaker City Motor Club, which stated that the Pullman car had been awarded the race. Mr. Kline then announced that the York Motor Car Company had challenged the manufacturers of the Studebaker car to race one of their 40-horsepower machines any distance up to 1,000 miles for a purse of \$5,000.

Preceding the banquet was an automobile parade, in which twenty-five of the Pullman models took part. There was a band, and each automobile was decorated. The Pullman "Swamp Angel," which won the race to Savannah, headed the procession. It was driven by Robert Morton, and, besides him, contained General Manager James A. Kline and M. H. Schuler.

E. V. CO. TO BE LEGALLY WOUND UP.

HARTFORD, Conn., March 30.—It is reported that foreclosure proceedings will be instituted in the United States Circuit Court for the district of New Jersey this week, with a view to legally winding up the affairs of the defunct Electric Vehicle Company, as it is said to be the desire of the bondholders of the company to dispose of it as a going concern to the Packard Motor Car Company of Detroit. The situation is somewhat complicated by the efforts of the Electric Storage Battery Company of Philadelphia, the largest single stockholder, which holds \$6,500,000 of the paper, to reorganize the company, though its attorneys would give no information on this point.

When called upon to confirm the report of the foreclosure proceedings, the attorneys for the receiver in New Jersey, Lindabury, Depue & Falks, stated that they knew nothing of it and that an application to continue the manufacture and sale of cars from parts and material on hand, had been made to the court and granted on Monday last. Receiver Nuckols has been in Chicago during the past week, closing the branch in that city on April 1. The New York branch is to be closed on April 25. It is reputed to be the intention of the Packard company to devote the Hartford plant to the manufacture of commercial trucks, the motors of which will be built in Detroit.

CHICAGO'S CARNIVAL IN SUCCESSFUL PROGRESS

CHICAGO, March 30.—On a most pretentious scale the spring carnival of the Chicago Automobile Trade Association was inaugurated Saturday night, and to-day there is every indication that the affair will be a huge success. Every one of the stores along the row has been artistically decorated for the occasion with ferns and other potted plants; some of them have added outside decorations, and all along the street there is a carnival spirit that cannot help but enthuse dealers as well as prospective customers. In fact, every one of the sixty and more members of the trade association has entered into the spirit of the affair, and, with their shoulders to the wheel, they are pushing with a unanimity that cannot help but bring success.

A census taken of the row Saturday shows there are fifty-two representatives of car concerns participating, while there are thirteen tire concerns and eleven houses handling accessories. This, it is calculated, means the carnival is a million-dollar show, for the total list of the 216 different models on view reaches \$900,000, while the tire and accessory exhibits easily add the other \$100,000. This census also disclosed the fact that there are seventy-six different makes of cars on exhibition, of which number all are American-made except two, the Renault and Isotta. In this lot are several motor buggies and commercial propositions, while the motor cycle is well represented.

The carnival was opened with an illuminated parade Saturday night, and it was the grandest affair of its kind ever witnessed in Chicago. The weather man, though, had a grouch. The judges, Ira M. Cobe, John W. McKinnon, and George C. Greenburg, counted ninety-two cars in line when the parade went past the reviewing stand for the first time. All of them were not dec-

orated, however, it being Chairman Paulman's idea to alternate an illuminated, then an undecorated car, in order that the spectators might better study the beauties of the illuminated display. It was no easy task picking the winners—there were so many beautiful designs. There were three prizes, but, in addition, it was decided that there should be ten given honorable mention. The judges' decisions were as follows:

First prize.—Thomas Flyer roadster, driven by C. A. Coey.
 Second prize.—White steamer, driven by Miss Mildred Plew.
 Third prize.—Woods electric, driven by Paul Frank.
 Those to get honorable mention were as follows:
 Apperson, driven by J. F. Gunther.
 Ford roadster, driven by Robert Bartel.
 Vesta battery, a Thomas-Detroit, driven by C. E. Gregory.
 De Luxe, driven by E. E. Read.
 Stoddard-Dayton, driven by Marshal Rapp.
 Gearless, driven by H. W. Russell.
 Peerless, driven by John Bonschein.
 Pierce-Arrow, driven by Paul Hoffman.
 Pennsylvania tires, Mason car, driven by W. D. Rockwell.
 Indian motorcycle tri-car, ridden by John T. Fisher.

The awarding of first prize to Coey met with the approval of most of the critics, for the Thomas was most elaborately decorated. Coey, being president of the Aeronautique Club of Chicago, seized the opportunity to advertise the sky pilots by using an airship for his main idea. Simplicity and beauty were aimed at in the White steamer, and the judges hesitated a long time before they gave the first award to Coey. Miss Mildred Plew drove the steamer, a big White car, and was dressed in white. Carl Metzger, on the Woods electric, won third prize, his car being very expensively decorated.

SITUATION AT ALBANY IS COMPLICATED.

ALBANY, N. Y., March 31.—With the failure of the revised motor vehicle law bill to make its appearance in either house, although it was practically drawn and all but a few details agreed upon prior to the break between the New York State Automobile Association and the Automobile Club of America, there has come a decided activity in separate amendments to the existing automobile law. Those bills already in show an inclination to move, and others are being introduced.

At the session of the Senate last evening Senator Grady of the Sixteenth Kings district introduced a bill amending the motor vehicle law so as to include in the requirements for a licensed or registered chauffeur a minimum age limit of 18 years, and also the furnishing of a bond in the penal sum of \$2,000 for the payment of any injury, loss, or damage resulting either to person or property by reason of the unskilful or negligent management or operation of a motor vehicle by said registered chauffeur. The bill was referred to the committee on internal affairs.

KISSEL KAR CUTS CALIFORNIA RECORDS.

News comes from Los Angeles of another victory for the Kissel Kar on the Pacific coast. After breaking the Los Angeles to Daggett record, it followed up this creditable feat the very next day by setting up new figures for a run from Los Angeles to Victorville, a distance of 105 miles in 3 hours and 50 minutes, and also from Los Angeles to San Bernardino, covering 65 miles in 2 hours 5 minutes.

DAYTON DEALERS ORGANIZE TO HOLD SHOW.

DAYTON, O., March 30.—At a meeting of the local trade, held here late last week, the Dayton Automobile Dealers' Association was formed, G. G. Peckham being elected president, and A. M. Dodds, secretary-treasurer. Plans are already under way for the holding of the first automobile show this city ever seen. It will take place at Armory Hall, April 20-26 next.

MARYLAND WILL NOW HAVE ROADS.

ANNAPOLIS, Md., March 30.—The Good Roads bill has finally passed the Legislature. It is now a law, and has been signed by Governor Crothers. The bill was passed without a dissenting vote, after an agreement had been reached with reference to the provision relating to the taxing of railroad franchises on turnpikes. In the shape it has finally passed the bill appears to satisfy every element of both parties, and the most delighted of all are the automobile clubs of Washington and the State of Maryland, including the Automobile Club of Maryland. The work the bill calls for guarantees to Maryland the best roads in the country, and in the future tourists between New York, Philadelphia, Baltimore and Washington will not have to travel through a sea of mud in passing through Maryland.

In its present form it includes the best features of the bill that Benson presented, and the men who were instrumental in bringing about the result contend that it means that \$5,000,000 will be spent in this State within the next few years in building good roads and that not one cent of this amount will be taken directly from the masses. The tangle, which for a while threatened the bill, was finally straightened out by an amendment. The bill then went through both houses a-flying. The amendment regarded the United Railways franchises and turnpikes, by which the right of the city to collect the park tax in Baltimore from the company over those highways is guaranteed.

APPERSON WILL MAKE VANDERBILT ENTRY.

CHICAGO, March 30.—Edgar Apperson has announced his intention of entering an Apperson Jackrabbit in the next Vanderbilt Cup race under the colors of the Chicago Automobile Club. "If the race for the Vanderbilt Cup," said he, "is held in the vicinity of New York or at Savannah, I will enter a car in that event." This is believed here to be the first positive announcement of any American maker that he will be represented in the great American classic race on the road.

Midgets Touring the West in Their Imperial Roadster.

Count and Countess (nee Mrs. Tom Thumb) Magri and Baron Magri on their arrival at Topeka, Kan., in their Imperial car, in which they are traveling the country.

SEASON'S PACKARD OUTPUT FINISHED EARLY.

DETROIT, March 30.—In accordance with its long-established custom of making early deliveries of its product, the Packard Motor Car Company is busy to the full capacity of its immense plant, getting out the last 400 cars of its season's output. Already a thousand 1908 Packard "Thirties" have been delivered to purchasers, and the 2,000 men at work in the different departments of the factory, which covers a floor space of eleven acres, are now turning out cars at a rate which will probably complete the annual program of production on schedule time. Last season the final car was finished a month ahead of the scheduled time of delivery, and the company is anxious to be well advanced at the close of this season.

There is no long period of inactivity between seasons in the Packard factory. The production of cars of successive models is so arranged that, as one department completes its work for 1908, it picks up that for 1909. Thus the immense body-building department, which makes all of the Packard bodies, including the limousines and landaulets, naturally completes its output for the season before the assembling, painting and other finishing departments, and is one of the first to start on new work. The company's new power plant now being in operation, giving a total of 2,500 horsepower, the factory is in much better shape than ever to produce cars expeditiously.

INDIANA'S AUTO WEEK A SUCCESS.

INDIANAPOLIS, March 30.—Taken from both a commercial and an educational standpoint, the annual automobile show given here last week under the auspices of the Indianapolis Automobile Trade Association, was distinctly a success. Sales aggregating fully \$400,000 were made during the week, a comparatively low estimate considering the fact that about 200 automobiles were sold. Throughout the week there was the greatest harmony between the dealers and manufacturers. All of the salesrooms were elaborately decorated, and several concerns gave neat souvenirs or arranged for some special entertainment. At the last minute the parade to have been given Monday was postponed until Wednesday afternoon, but it suffered nothing from the delay.

Tuesday several hundred persons witnessed the four-tenths of a mile climbing contest on Michigan hill near the city, which followed a short parade on downtown streets by the contestants. The timing was accomplished by a very unique device, the contesting car breaking a thread which started a stopped watch which was stopped by electricity as a second thread was broken at the top of the hill. Rules of the American Automobile Association were observed in the events. The summary follows:

Cars Listing at \$1,000 or Under.

1. Buick, Buick-Losey Co., W. B. Peterson..... :48 3-5
2. Ford, Gibson Auto Co., Frank Menthorn..... :56

Cars Listing from \$1,000 to \$1,800.

1. Overland, H. T. Hearsey Vehicle Co., C. P. Brockaway.. :50 3-5
2. Stoddard-Dayton, Fisher Automobile Co., Guy Simmons. :51 2-5

Cars Listing from \$1,800 to \$2,740.

1. Stoddard-Dayton, Fisher Automobile Co., Howard Hodson :38 4-5
2. Thomas, Indiana Automobile Co., L. E. Finch..... :40 4-5

Cars Listing from \$2,750 to \$3,500.

1. Stoddard-Dayton, Fisher Automobile Co., Howard Hodson :37 2-5
2. Thomas, Indiana Automobile Co., L. E. Finch..... :40 4-5

Cars Listing Above \$3,500.

1. Stoddard-Dayton, Fisher Automobile Co., Howard Hodson :39
2. National, Fisher Automobile Co., Thomas Kincaid..... :39 2-5

It is estimated that fully 100,000 persons from all parts of Indiana saw the parade held Wednesday afternoon, when 226 automobiles, of which 175 were entered by local dealers and manufacturers, were shown. The others were driven by individual owners, and one of the interesting features was the first attempt in the city to show commercial vehicles on a large scale.

The week closed with a supper and smoker at the Grand Hotel beginning at 10:30 o'clock Saturday night, at which there was also a lively vaudeville entertainment. About 250 members of the trade, and their friends, attended.

Employees of the Packard Motor Car Company in One of the Courtyards of the Company's Plant at Detroit.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Continental Caoutchouc Company has offered \$1,000 in prizes to the finishers in top places in the Briarcliff race whose cars are fitted with Continental tires.

The Atlantic Motor Car Company, agents for the Stoddard-Dayton, with headquarters at 1776 Broadway, are the latest to expand, having been compelled to lease the adjoining store, thus doubling the size of their salesroom.

The Michelin Tire Company has confirmed its offer of cash prizes to successful contenders in the Briarcliff race equipped with its product. The prizes for entrants are: \$500 for first, \$350 second, \$200 third, \$150 fourth, \$75 fifth, with like prizes for the drivers of the cars.

By way of winding up the affairs of the bankrupt Dragon Motor Car Company, successor to the Dragon Automobile Company, the receivers will offer in April at public auction at the factory in Philadelphia the assets of the company. Included among them are said to be some seventy Dragon touring car chassis.

It is interesting to note that while pessimistic reports occasionally crop out regarding the automobile trade in general the actual facts of the case belie the opinion of the pessimists. The Bosch Magneto Company reports that it sold during the week ending March 14, 4,970 magnetos and that it is over 1,000 machines behind in its orders.

Unlike the Vanderbilt Cup course, there are not many places on the Briarcliff course from which an unobstructed view of the course can be obtained. A grand stand is being erected at the East View turn, which gives a clear view of the course for a half mile in each direction. Information concerning tickets for this stand can be had of Koenig Brothers, Tarrytown, N. Y.

Evidences of the scale on which the recently reorganized Wayne Automobile Company, Detroit, Mich., is planning to turn out cars are to be seen in its order for \$200,000 worth of machinery, most of it designed by W. E. Flanders, general manager, who, with President B. F. Everett, have been given carte blanche by Messrs. Palms and Book, the backers of the concern.

The New Departure Manufacturing Company, Bristol, Conn., recently received a strong testimonial letter from Apperson Brothers, of Kokomo, Ind., regarding the very satisfactory performance of the New Departure annular ball-bearings, which were used in the winning Apperson at Savannah, Ga. These bearings will form part of the regular equipment of all the Apperson cars turned out during 1908.

Cartier, Chapman & Company, Ludington, Mich., report that business is better than it ever has been in the history of the concern. They are the makers of the Breeze windshields, and the improvements recently added to their line have created a demand that is bringing them orders from all parts of the country. The company states that it has not had occasion to lay off a single mechanic or lose an hour's time throughout the past winter.

"According to figures compiled by the American Motor Car Manufacturers' Association, it is apparent that enthusiasm has been rekindled with the coming of spring," says F. P. Brand, president of the Imperial Motor Car Company. "The registrations at Albany have been unusually heavy this month—751 cars having been registered in New York State during the first three weeks of March. I believe 1908 will witness the breaking of all automobile sales records."

An incident which marks an epoch in the automobile industry was the shipment of the first car from the new Maxwell factory at Newcastle, Ind., last week. From now, each Maxwell plant will devote itself exclusively to the manufacture of but one model in its entirety—the light runabout being made at Pawtucket, R. I., the four-cylinder, 28-horsepower touring car at Tarrytown, and the two-cylinder Model "H" roadster and touring car at Newcastle, Ind.

"The recent Boston show brought us the best business we have ever had from an automobile show," said B. A. Becker of the Elmore Manufacturing Company, Clyde, O. "The public would be very much surprised to learn how well-posted auto purchasers are becoming on the question of the two-cycle cars," he added. "The simplicity of this type of motor, together with the low cost of maintenance, are such strong points that the Elmore factory is unable to keep up with the demand."

The touring bureau of the White Company, Cleveland, O., has just compiled the sixth in the series of White route books. The new issue covers the route from Philadelphia west over the National highway, as far as Springfield, O., and then southward as far as Savannah. It gives the first definite data published on the roads of Kentucky, Tennessee, Alabama and Georgia, with directions for following the National highway through Maryland, Pennsylvania, West Virginia and Ohio, which are given for the first time with accuracy and in detail. No less than 1,800 miles of road are covered, beside which there are numerous illustrations, a double-page map and articles descriptive of the route. Copies may be obtained gratis on application to the White Company or any of its numerous branches, or to the White touring bureau at 1402 Broadway, New York.

RECENT BUSINESS CHANGES.

The R. E. Hardy Company, manufacturers of Sta-Rite spark plugs, has moved from 86 Watts street to 25 West Forty-second street, New York City.

The Auto Tire Company, of Kansas City, Mo., has removed to its new location, 605-607 Fifteenth street, that city, where a new tire repair plant, said to be one of the most complete in the West, has been installed. Victor Nelson is the proprietor, and the concern carries a full line of Morgan & Wright tires, for which it is general agent.

John H. MacAlman, for the past two years manager of the Columbia Motor Vehicle Company, Boston, has taken a lease of the Columbia salesroom and repair shop on Stanhope street, that city,

and will continue business under his own name. He will continue to handle Columbia cars, having been assured of a supply from the Hartford factory, and may later take on some other line in addition. Mr. MacAlman is president of the Boston Automobile Dealers' Association and one of the best known tradesmen in the New England States.

NEW AGENCIES ESTABLISHED.

The French Manufacturing Company, Waterbury, Conn., who make a full line of seamless tubing for automobile use, are now turning their attention to lighting tubing, of which they will make a specialty.

The Curtis-Hawkins Company, the Motor Mart, Boston, has just secured the agency of the Speedwell cars for that territory. The Speedwell is a comparatively newcomer and is made in Dayton, O.

George H. Lowe has just closed a contract with the makers of the Imperial Roadster, the Imperial Motor Car Company, of Williamsport, Pa., to handle it in Boston and vicinity during the coming season.

The Butte Novelty Works, Butte, Mont., have just taken on the Franklin line for 1908. They also handle the White steamer. The Warren Automobile Garage, Warren, Pa., which also handles the Franklin, is now owned entirely by D. M. Jackson, the firm formerly being Jackson & Cross. It is said that applications for the Franklin sales agency have been received at the rate of eight per day since March 1.

PERSONAL TRADE MENTION.

General Manager S. A. Miles, of the N. A. A. M., who is touring abroad, has completed a run of over 400 miles in Wales.

J. H. Baer, designer of the Buffalo carbureter, has been on a trip visiting the Eastern trade. The National Sales Corporation, 296 Broadway, New York, is the factory sales agent for this make of carbureter.

W. B. Hurlburt and C. R. Teaboldt, manager and secretary of the Garford Motor Car Company of New York, have been constant visitors at the factory at Elyria, pushing deliveries of Garford cars for the Eastern market. A large number of orders have been booked.

J. F. Somers, formerly with the automobile department of Brown, Thompson & Company, Hartford, Conn., has been engaged as manager of the Post & Lester Company's retail branch store, situated at 175 Asylum street, in the same city, and has already taken up his new duties.

INFORMATION FOR AUTO USERS

"Uphrow-Cushion" Springs.—This is an ingenious and simple device recently placed on the market by the Thomas Spring Works, Canisteo, N. Y., and is designed to prevent the breakage of leaf-springs by "upthrow." As will be noted from the accompanying illustration, the complete device consists of a special form of coiled spring, adapted to be clamped

UPTHROW CUSHION SPRINGS.

on the axle and strapped to the frame, though two styles are made permitting them to be attached either under, or over, the axle. Four comprise a set, in order to protect each one of the springs of the car. Perfect freedom of spring action is allowed on the downward movement, but the Uphrow-cushion comes into play as soon as the upward thrust of the body rises above the normal and the coil springs then begin to resist, softly but surely. The straps shown are designed to be attached to a forged hanger bolted to the frame inside near the bottom. These straps are drawn taut and buckled after the car has its normal load aboard, and after that do not need to be disturbed.

Swinehart Detachable Solids.—Great pains and study have been devoted to the perfection of detachable devices for pneumatic tires, but up to recently this has not been the case with the solid tire for commercial use, though the loss of a tire means more to the owner of an automobile truck than it does to the autoist who drives for pleasure alone. To supply this

applied within twenty minutes, so that there need be no delay worth speaking of. The locking device not only secures the rim laterally, but it also wedges it tightly on to the retainer so that there can be no play between the rim and the rim retainer. The endless wire connected with the right and left-hand threaded turnbuckle can be loosened in less than half a minute; it can also be removed, reapplied and tightened up in about the same time. The method of mounting this new Swinehart rim and tire is clearly shown in the cut.

Kochler's Universal Auto Spring.—From the very start, auto makers have adopted the old-time carriage types of springs, and no attempt has been made to depart from these time-tried designs, although it has been apparent that the suspension of an automobile required something different. Hence, the shock-absorber. But this new device, which is made by the Universal Auto Spring Company, Broadway and Branch street, St. Louis, Mo., is complete in itself and requires no supplementary devices. As will be seen from the illustration, a section, of about 8 inches, is cut out of the center of the half-elliptic spring, or the lower

DETAILS KOEHLER'S UNIVERSAL SPRING.

member, where a full elliptic is used. A fulcrum bracket is then placed in the same relative position on the spring seat, as shown, directly over the axle, while fulcrumed to this bracket is a drop-forged steel arm, called the spring equalizer. To these equalizers, on the upper part, are fastened the ends of the quarter elliptic springs, and, on the lower ends, between the two equalizers, is placed a barrel-shaped compression spring, beside two coil-springs of smaller dimensions on the opposite side from the compression spring. The last-named spring is adjustable to fit the height of the body, the adjustment being made through the equalizer member. This combination of balanced forces effectively prevents all shocks and jars from being transmitted to the body or mechanism of the car, as they are entirely absorbed in the springs.

K-W Magneto.—Though the K-W magneto has now been on the market less than two years, the makers—The K-W Ignition Company, 34 Power avenue, Cleveland, O., report that the demand for it is increasing so rapidly that they have become compelled to increase their facilities for manufacturing, and have also had to add to their working force. An improvement has been made in the friction drive used on this year's model of the magneto, the face of the friction wheel having been made twice as wide as formerly. It is built up of a number of rings of chrome-tanned leather, making it oil-proof, and according to the makers this type of friction wheel will give as positive a drive as a chain or gear. The K-W type of magneto occupies a unique position in the igni-

tion field, as it is the only one of its kind that does not have to be positively driven in order to give good service. It is intended principally as a substitute for the battery and is employed in connection with the usual vibrator coils. The current generated is known as a "sine wave" current, in contrast with the usual high peaked wave alternating current, thus making its output of a uniform value above a certain speed which permits of the operation of the magneto by means of a friction drive or belt, without interfering with the synchronism of the ignition sparking. The magneto is of the inductor alternator type, thus having no moving wires, or brushes, which make it extremely simple.

K-W MAGNETO.

Oberdorfer Carbureter.—This is a new representative of the concentric float carbureter, and is being made and marketed by the M. L. Oberdorfer Brass Company, Syracuse, N. Y. It is provided with central air-opening, auxiliary air-valve, and has usual adjustments for needle valve of the spray nozzle to regulate the flow of fuel from the float chamber. The method of adjusting the tension of the auxiliary air-valve spring is by means of a screw, as shown, and this, as well as the other adjustments, with the exception of the gasoline feed valve *B*, may be made from the outside without disturbing any other parts. To adjust *B*, the cover *B3* must be removed and the valve lifted out. The cone *B* can be driven up or down its stem, to increase or diminish the part of the stern *B2*, which bears on the top of the lever *B4*, arching over the upper part of the

SECTIONAL VIEW OBERDORFER CARBURETER.

float *C*. The length of the arms of the lever *B4* is such that the rise and fall of the needle *B* is just half that of the float *C*. The normal air supply enters as shown by the arrows *E1*, the size of the opening being varied by raising, or lowering, the regulator *E* and locking it in place. The needle valve *D* does not rise to the tip of the nozzle *N*, thus retaining a small quantity of gasoline in the hollow between the tip and the opening of the nozzle, to facilitate starting. The auxiliary air-valve *G*, with its spring *H*, is of the conventional type, as is also the butterfly throttle *F*.

THE AUTOMOBILE

NEW YORK'S automobile carnival is in full swing. In the elaborateness of the decorations, in the universality of the participation of the trade, in the co-operation of the entire Automobile Row district, in the general hurrah, in the interest this celebration of the tenth birthday of the motor car industry in this country has aroused, and in Tuesday night's monster parade, the carnival has surpassed in magnitude

and magnificence the fondest hopes of its promoters, the members of the New York Automobile Trade Association.

The two miles of Broadway from Forty-second to Eightieth street, comprising Manhattan's automobile row, is ablaze with flags and bunting. Not only is every building having to do with the industry decorated from cellar to roof, but the hotels, restaurants, saloons, and many shops have joined in making this carnival week a New York holiday so far as the hotel and motor car district of the city goes.

Along upper Broadway throngs parade the great thoroughfare rubber-necking at the decorations above and peering into the corridors below. The salesrooms and garages are ablaze with lights and gay with decorations. Demonstrators are at hand to answer questions and point out the particular features of the cars. All along the line there are reports of sales, consummated even thus early in the week and glad tidings of bright prospects ahead.

The dealers, however, have little time or inclination to talk of individual benefits derived. All have been fairly carried off their feet by the magnitude the carnival has assumed and the response New Yorkers have

given to their efforts. All are confident that the carnival will show results at once which will extend far into the season; to put it more truly and frankly, all rejoice in the conception and promotion of the celebration as a means of stirring up the motoring metropolis from its semi-lethargy and cynical pessimism to a realization of how very much alive the automobile is in New York. They are happy, too, at the successes Chicago and Indianapolis have scored through seizing so promptly their suggestion of a carnival and proving by prompt promotion the worth of the idea.

It is a revelation of the innate possibilities for enthusiasm and local patriotism the co-operation the carnival scheme has met with from the general New York public. Automobile Row furnishes an eye opener, indeed, of the extent of the local industry as emphasized by the fact that from Forty-eighth to Sixty-fifth street on both sides of Broadway there is an almost unbroken line of automobile trade establishments. The decorations pick them out. The spots between, occupied by many hotels, restaurants and saloons, are decorated, too, thus making the string of flags and bunting continuous along the route.

Below Forty-ninth street lies the hotel and restaurant district around Times square. This leads the building dressing with brave displays. Flags float from every window of the Times Building. Rector's, Shanley's, Churchill's and the Cadillac are smothered in bunting. The decoration fever is spreading and the professional decorators are as busy as bees adding red, white and blue to Broadway. Even as far down as the twen-

given to their efforts. All are confident that the carnival will show results at once which will extend far into the season; to put it more truly and frankly, all rejoice in the conception and promotion of the celebration as a means of stirring up the motoring metropolis from its semi-lethargy and cynical pessimism to a realization of how very much alive the automobile is in New York. They are happy, too, at the successes Chicago

King Clark in a Waltham.

Queen Joan in a Mora.

ties and thirties, Martin's, the Breslin and the Grand have hung out bunting and flags. Above Sixty-fifth street the automobile establishments are a bit more scattered. Here, though, the Belle-claire and other hotels have helped out in the decorations.

Automobile Row has many great garages and big buildings. None of their owners or tenants has been feazed by the expense or difficulty their size presents for decoration. Every one of the big establishments has been completely decorated from sidewalk to the roof. The great buildings occupied by the Palmer & Singer, Ford, Lozier, Rainier, Haynes, Southworth, Stearns, White, Panhard, Homan & Schultz, Corbin, and American Locomotive branches and agencies are ablaze with flags and bunting.

Father Knickerbocker, in a word, is doing himself proud during this his first automobile carnival week.

'Twas a Most Convincing Parade.

Automobilists Tuesday night gave to New York another great night celebration. To Father Knickerbocker's New Year's eve racket and his Election night hurrah must now be added the Automobile parade; for this annual spring opening carnival will doubtless be perpetuated. The automobile celebration stretched for nine miles. Along Broadway from Twenty-fifth to One Hundred and Tenth street, and on Fifth avenue from Twenty-fifth to Fifty-seventh street, crowds jammed the sidewalks on both sides. Allowing but 3,000 spectators to a block, the figures will reach 560,000 to view Tuesday night's parade. Such a demonstration of the magnitude of the industry, it is safe to say, this or no other country ever saw before.

The parade was a monster affair. In its broken form, slowing down in places and racing in others, it took 1 hour 40 minutes to pass the west side of the reviewing cars at Eighty-fourth

street. In solid order, after Grand Marshal R. G. Howell had waited for the ranks to close up, the procession was an hour in passing the judges. At its slowest gait, fourteen cars went by a minute and at a faster pace twenty-two were counted in the same time. This would indicate some 1,200 cars in line; in fact, the committee's conservative estimate put the total at about this number, distributed as follows: Ancient and racing cars, 100; dealers' division, 800; decorated cars, 50; commercial cars, 250. New York's biggest previous parade numbered less than 300 cars.

The four divisions formed in Fifty-seventh, Fifty-sixth, Fifty-fifth and Fifty-fourth streets, west of Broadway. They began to assemble after 6 o'clock, and at 8:35 the procession started down Broadway, its route taking it to Twenty-fifth street on that thoroughfare, then to Fifth avenue up to Fifty-seventh street, crossing over to Broadway and up to One Hundred and Tenth street and countermarch back to Columbus Circle, where it disbanded. Colored lights were burned on much of the route and along lower Broadway confetti was showered upon the spectators. New Yorkers, in a word, made a night racket of the parade, packing the restaurants until daybreak.

Features of the parade were too multitudinous to be catalogued in a single story, in which only comparatively few details can be touched upon. Inspector Schmittberger led the parade in a car trimmed with N. Y. A. C. emblems. He was followed by a squad of cycle cops, preceding Grand Marshal R. G. Howell in a Northern runabout, decked with flags and bearing his title in an electric frame. Mrs. Joan Newton Cuneo, the Queen, came next in a six-cylinder Mora car, seated on a flower-decked throne, smothered in roses. Leonard K. Clark, the King, in a Waltham, followed, also on a throne.

The first division was made of a mixture of the old and the

Benj. Briscoe's Maxwell—Winner of Second Prize.

DeWitt Company's Hobo Car—Grotesque Winner.

new. There were chronological series of Haynes and Autocar machines, from 1898 to 1908; ancient Panhards, the original Welch, and 1898 Gasmobile, with "Birdie" Munger at the wheel; a '95 Apperson, a two-cylinder Locomobile, and an ancient White steamer among the racing cars of former and present times; Panhard, Renault, Mercedes, Lozier, Stearns, Simplex, Maja, Fiat and Allen-Kingston machines, Barney Oldfield and Joe Tracy being noticeable among the drivers.

The dealers' division followed. It was an almost endless procession, most of the makes being designated by special flags. Prominent in the line were 200 Maxwells, 70 Fords, 50 Oldsmobiles, and close to 40 White steamers. The Stearns cars had their names on red strips on a raised framework, and the Berliets bore big red flags, whereon were great white locomotives. The American Locomobile Automobile Company's garage, by the way, was the most elaborately decorated building en route, being festooned with electric lights from top to bottom. Rambler, Rainier, Haynes, Stevens-Duryea, and Pope-Hartford also make a brave numerical showing.

In the decorated division there were some notably elaborate creations. The first prize went to Gen. John T. Cutting's Oldsmobile. It was a dream in white, being completely smothered in pampas grass. Beneath a canopy a beautifully dressed girl sat; red electric lights illumined the canopy and a cluster of colored lights blazed in front. The driver and mechanic were dressed as white-hooded Arabs.

Benjamin Briscoe's Maxwell carried off the second prize. A queen surrounded by her ladies-in-waiting sat beneath a canopy of lilies and hydrangeas. The wheels were banked with chrysanthemums and the bonnet and driver's seat were enveloped in hydrangeas, colored electric lights illuminating the whole. Honorable mention was accorded the Oldsmobile company's other entry, a lilac-decked car, beneath whose canopy stood the Goddess of Liberty surrounded by pretty girls garbed in white.

The prize for the most grotesque car went to the DeWitt Auto Company's "hobo" car. A cooking stove with standing pipe formed the bonnet and tomato cans abounded. The wash was hung out to dry and brooms and brushes were elevated, while

behind a boy's box goat-wagon dragged. The driver and passengers of this were made up as tramps.

Another clever comic conception consisted of the presidential candidates in a Lozier, in which the driver was Roosevelt; the mechanic, Taft, and the passengers Hughes, Cannon, and Bryan, all being well made up to resemble the famous men named. The sign above the driver's seat was: "Me or Him;" on the tonneau it read: "Have We a Show?" "My Message to My People" being behind. It was blank. Peter J. Fisher's car was dressed with all the flags of the hockey teams, while L. A. Hopkins' American Mors limousine was most artistically decked with colored electric lights. Dr. Julian P. Thomas, the aeronaut, had a flying machine rigged up on a motor tricycle. It did not, however, get as far as the reviewing stand.

Two boys rigged up a curved-dash Oldsmobile runabout as a 'round-the-world car that left Paris, April 7, 1907, and reached New York, April 7, 1908. It was loaded with tire and camp utensils and covered with mud. In the commercial section there was a stunt that aroused much merriment. Hitched to the tail of a motor truck was an old equine quadruped with a sign: "The Passing of the Horse."

One of the most amusing incidents of the entire parade was the arrest of Elwood Haynes by Bicycle Policeman T. H. Kerrigan, who discovered that the original Haynes of 1893 was minus a license number, and he accordingly placed the veteran auto builder under arrest at Broadway and Fifty-seventh street. The magistrate, however, decided that he could release Mr. Haynes without violating the law.

The commercial vehicle division was an amazing demonstration of the varied utility of the automobile. It embraced sight-seeing 'buses, furniture vans and many types of delivery wagons. The B. F. Goodrich Company had an elaborate float showing a monster Goodrich tired wheel illuminated by electric lights. The Continental and Firestone people also had trucks. Other trade exhibits included the Studebaker, Frayer-Miller, Panhard, Splitorf, Fickling and Jones Speedometer. The Hewitt Motor Company showed many varieties of trucks and the New York Transportation Company put out a squadron of taxicabs.

Three Tire Companies Figured Prominently in Commercial Vehicle Divisions—Continental, Firestone, and Goodrich.

CHICAGO'S CARNIVAL CONTENDED AGAINST WEATHER

CHICAGO, April 4.—The first experience of the Chicago Automobile Trade Association in the promotion of a Spring carnival has left a satisfied feeling among the dealers, the only regret being that the weather was a little too chilly for comfort. The carnival came to an end to-night, after a week's run, and the local trade now is prepared to fall back to the routine pace and await the results of their show efforts. Summing the situation up, one feels that the affair would have been a much greater success had it really seemed more like Spring. Four days it either rained or was so cold that few cared to venture out for demonstrations, but the latter end of the week the weather man relented, and the brand of weather improved.

It was more a promoter of sporting events than as a show impressario that the trade association shone, the illuminated parade, two gymkhanas, and a tug-of-war affording enough variety to interest the public and attract it to the "Row" in goodly numbers. But again the weather was against these events. The parade last Saturday night was witnessed by some 30,000 people, but it was a shivery lot, and the occupants of the cars braved pneumonia in making the circuit of the three sides of the city. Wednesday night had been selected as gymkhana night, but at noon that day it was raining, and Chairman Paulman decided to postpone until the following night. At 4 o'clock, however, the weather man was proved a false prophet. He had predicted snow, and that scared Paulman. However, at 4 o'clock, the sun came out, the clouds disappeared, and Paulman immediately decided to run the affair, after all, that night. He did, and it was a great success—so great, in fact, he decided to repeat Thursday night, with the tug-of-war as an additional feature.

The gymkhana was the first one Chicagoans ever had seen, and they liked it immensely. The technical committee of the Chicago Motor Club was requested to handle it, and it framed the rules, appointed the officials, and scored another success in the promotion line. The rules divided the gymkhana into five sections, the route being laid between Twelfth and Sixteenth streets.

Ford and Elmore Were Winners.

These five sections made a gymkhana which certainly furnished enough novelty to amuse the bystanders, who thoroughly appreciated the efforts of the drivers. In four of them it was necessary to drive on the high gear, but in the teter it was allowable to switch gears and to use the brakes. Twenty-four cars took part in Wednesday night's gymkhana, and twenty-eight on Thursday night. In each a different winner was evolved—a Ford run-about, driven by M. J. Lanahan, capturing the honors of the first affair, and an Elmore touring car, driven by Harry Sultzpaugh, taking the renewal. That experience counts was shown Thursday night, when much better work was done by the contestants. The Ford was first Wednesday night, with seven points penalization against it, while the Elmore improved on this the next night by going through with only one demerit, that imposed in the lemon-spearling stunt. Eight of the cars Thursday night beat the Ford's score, showing that practice makes perfect. The Ford was one of those to eclipse the first night's performance, but it only landed in a tie for fourth with the Mitchell, which was a runner-up in the first affair.

Average Race Was a Feature.

Probably the feature of Thursday night was the average race, in which the object was to maintain a 4-mile pace. In this, two cars hit it on the dot, the Elmore and the Welch. Wednesday night no one was perfect, the Pierce-Arrow and Mitchell being closest, with one point penalty. In the apple race, too, there was marked improvement, only three being perfect in the first attempt, and nineteen in the second.

The Elmore, despite its almost clean sheet, did not have much

to spare, for it was pushed closely by the Overland and Buick. Price, in the Overland, missed out through failure to maintain the 4-mile clip, being penalized two points, the only demerits he drew. The Buick, which was not in the first gymkhana, also slipped up in the average race, being penalized four points.

In the test Wednesday night the drivers clearly showed lack of experience, Lanahan being about the only one to have his lesson anywhere near perfect. His margin of victory was great, he being twenty-one points to the good of the Mitchell. He handled his car cleverly in the teter and obstacle events, and might have been tied with the Overland Thursday night had he not knocked over three blocks in the obstacle race in his anxiety to make a good score.

Rapid Wins Tug-of-War.

The tug-of-war Thursday night resulted in a clean-cut win for the Rapid truck, which outpulled the Meiselbach with little apparent effort three successive times. It was best three in five, and it was necessary for the winner to pull the other truck 10 feet. Each car was loaded with about 800 pounds of pig lead to give traction, William Duffy driving the Rapid, and Harry Endicott the Meiselbach. Both trucks were equipped with two-cylinder double-opposed motors, the Rapid being 24-horsepower and the Meiselbach 28. The former had planetary gear and the latter is friction-drive. In none of the three trials did the Meiselbach make a fight, the Rapid getting the jump each time and hauling its rival the required 10 feet without any apparent effort. Herewith are the scores:

Wednesday's Gymkhana.

PARIS SORE OVER BAD BEATING.

PARIS, March 31.—There will be no glad hand, champagne, bouquets or official receptions for Brinker, Roberts, or whoever may succeed in piloting the Thomas Flyer to the French capital. Paris has received news of the American car's arrival at San Francisco and has not thrown its *bonnet rouge* into the air. It would be more correct to say that Paris has damned the New York-Paris tour, not in a polite, genteel, fashionable manner, but in that vehement style that is characteristic of the Gaul.

Godard has written home hair-raising accounts of the dangers and difficulties of a run to San Francisco. In wild language he tells his compatriots how the "peasants" have robbed and deceived him, how wicked they are and how they took advantage of his lack of knowledge of the country. The meager 24 horses under tricolor bonnet were insufficient in competition with the 60-horsepower of the American, and the trail of gold which the Yankee could scatter along the road appalled the Frenchman.

What Godard has to say does not influence the public very much, for there is a strong impression since some of the Pekin-Paris facts came to light that the French driver is not a very reliable individual. Georges Prade, editor of *Les Sports*, may be taken as a person bolding a much more sober view of the situation, but he has to write that "the sole effect of New York-Paris has been to give the Americans an opportunity of proving that on American roads an American car is capable of meeting three French automobiles and scattering them all."

Says the Parisian editor: "The American car has triumphed because its ignorant, ill-equipped and unskilled rivals have had breakdown upon breakdown. The lesson of Pekin-Paris ought to have been sufficient for us; now it is New York-San Francisco, a defeat in the only country in the world in which French automobile commerce is increasing. At the bottom all the interest of the trip lies in this journey to San Francisco; afterwards it is a succession of boats and of journeys in British Columbia and Alaska, where there is nobody to see the competitors and where they can do no harm except to themselves. But a defeat in the United States—and defeat is but a feeble word—a defeat in which our best car is dead heat with the last, cannot but be deplorable to the name of France.

"I am certain that Motobloc and De Dion are not proud of the fact that they have been beaten by an American car that in this country we should place in the second class, by an Italian car which is not in the first rank, and to be dead heat at the rear with a German that has just entered the automobile industry. Happily the Grand Prix is coming, and the Thomas car is engaged in this great event. Then, I am certain, the American car will be brought down to its correct level. It is sad, however, to have to wait for the Grand Prix to save the French industry from the evil effects of the Round-the-World tour."

About the Alaskan Route.

The cars are to travel over the Government mail route to Fairbanks, down the Tanana to Fort Gibbon, and down the Yukon to Kaltag, across the trail to Unalakleet, and along Norton Sound to Nome. The distances are varied and some of the stretches will require extra fuel preparations:

To—	Miles	To—	Miles	To—	Miles	To—	Miles
Comfort Camp...	10	Creek	156	Clark's	334	Kofrine's	614
Workman's	18	McMullin's	172	Thirty-five-mile	341	Malois	640
Roadhouse	26	Paxton's	188	Piledriver	346	Kayukak	680
Ptarmigan Drop	26	Yost's	206	Byler's	356	Nulato	700

THOMAS FIRST ON ALASKAN SOIL.

SAN FRANCISCO, April 7.—By the arrival of the De Dion here, where they received an enthusiastic reception, the Frenchmen will be enabled to start on an equal footing with the Italians in Alaska. The Germans are in hard luck, having broken down again at Kelton, Utah, compelling a second return to the Union Pacific shops at Ogden, Utah.

Monday was a day of rest for all the participants in the New York-Paris automobile race, as the arrival of the Thomas at Valdez, the overhauling of the Zust at San Francisco, and the repairing of the De Dion and the Protos at Tulare, Cal., and Kelton, Utah, respectively, could hardly be called work, when compared with what the crews have been undergoing on the road. By reaching Alaska at this time, the Americans in the Thomas gain a full fifteen days' lead over their nearest competitors, the Zust crew, but as the latter cannot leave San Francisco until April 10, and cannot sail from Seattle until April 16, the De Dion will have an opportunity to get on an even footing with them, so that the Italian and the French cars will arrive in Alaska together. Two weeks at this season of the year may make a tremendous difference in the conditions in Alaska, and it remains to be seen whether the lead thus gained will be an advantage to the Thomas or not.

For a time it looked as if the German crew would have an opportunity to catch up with their Italian and French contemporaries and take the same steamer for Alaska, but they had the misfortune to break the differential at Kelton, Utah, which caused a delay of two whole days. They still bave Death Valley to cross in their heavy car, and then the run up through California, either through the interior, as the Thomas and De Dion went, or along the coast, following the track taken by the Italians. The distance is 1,200 miles, which will mean at least eight days of traveling, so that there is no hope of the Protos leaving Seattle with the Zust and De Dion. But for its misbap between Los Angeles and San Francisco, which cost a day, the Zust crew would have been able to sail from Seattle April 8.

The cordial receptions that they have received at every point along the route since leaving the snows of Wyoming, not alone from their own countrymen, but from the entire population of every town passed through, have done much to encourage the foreign crews. They have had tremendous odds to contend against—conditions far worse than they had ever dreamt of, but a few days in a milder climate and the comparatively easy going of the last stretches of the transcontinental trip have sufficed to make all of them very optimistic, and they will begin the second installment of the race with renewed vigor.

Map of the Route Through Alaska.

Oldfield Trying Course with H. W. Whipple's Stearns.

BRIARCLIFF TROPHY RACE, APRIL 24, SURE.

There will be no postponement of the Briarcliff trophy race after all, despite the fact that some parts of the course were so deep last week as to be impassable. At a meeting of the entrants, held on Thursday of last week, at which 17 of the 20 cars nominated were represented, to discuss the situation, it was decided to go ahead with the contest on the date originally scheduled, April 24. It was pointed out that a month's delay would be very expensive to the concerns that had engaged crack drivers and prepared for elaborate training outfits that the race was originally intended to be a strenuous road rather than a mere speed test of cars and that the contest had been scheduled for April to boost early Spring trade. Besides assurances were forthcoming from the management that a big force of workmen could be put on the road so as to have it ready, not only for the race but for preliminary practice as well.

Entries were announced as finally closed with 22 nominations in all, four additional cars having been added to the list at the eleventh hour, a Simplex, named by C. A. Singer; a Benz, entered by Louis J. Bergdoll, of Philadelphia; a 40-horsepower Bianchi, entered by Percy Owen, Inc., the American representative of the Italian car, which will be handled on the course by Felix Prossen, and a 35-horsepower Renault, similar to the first car of the same make that has been listed, and which has been entered by Robert Guggenheim. It is not known as yet who the driver of the second Renault will be. The entries in full are:

Car.	Entrant.	Driver.
Hol-Tan	C. H. Tangeman	Hilllard
Renault	Paul La Croix	Bernin
Stearns	A. W. Church	Vaughan
Stearns	H. W. Whipple	Oldfield
Flat	E. R. Hollander	Cedriano
Isotta	J. H. Tyson	Strang
Isotta	C. M. Hamilton	Poole
Isotta	C. M. Hamilton	Harding
Stearns	F. B. Stearns	Leland
Allen-Kingston	A. Hammersteln	Campbell
Panhard	A. Massenat	Robertson
Lozler	H. A. Lozler	Mulford
Maja	J. J. Brown	Murphy
Flat	Joseph Josephs	Parker
Thomas	H. S. Houpt	Roberts
Apperson	S. B. Bowman	Lytle
Simplex	C. A. Singer	Watson
Benz	L. J. Bergdoll	Bergdoll
Simplex	C. A. Singer	Seymour
Blanchi	Percy Owen, Inc.	Prossen
Renault	Robert Guggenheim	

It was finally decided at this meeting to make the distance 10 laps of the course, or approximately 300 miles, and as it is not to be expected that the roads will be in the very best of condition, the running of the race will probably consume six hours. The event will be one wherein the skill of the driver will be a big factor, and victory may not go to the fastest car. The brash one may have his chances spoiled by eagerness and speed.

HOW TO REACH BRIARCLIFF COURSE.

By H. A. GRANT.

Probably every automobilist within range of the stock chassis race course at Briarcliff plans to be there on and before April 24. The writer lives but a few miles from the course, and has motored all over this section. Possibly, the following information may be of use to your readers:

I would say that in an article recently published, stating that the Harlem Railroad reached Briarcliff is an error. Briarcliff is reached by the Putnam Division.

To reach Briarcliff by automobile: From New York City follow up Riverside Drive to Kingsbridge, thence to Yonkers, Hastings, Ardsley, and Tarrytown. At Tarrytown, at the corner of Broadway and Main street, turn sharply to the right and follow the trolley tracks for about 200 yards; here the trolley line branches off through a cut. Continue along the road until you reach the summit of the hill and follow straight and *do not* turn to the left.

After descending a slight grade, you will cross the Putnam Railroad tracks; after crossing, follow along the shore of the lakes to East View, a small town situated on the course. At East View, I am informed, a grandstand is being erected. For particulars, inquire of Koenig Bros., Tarrytown, N. Y.

The race starts at Briarcliff. At East View, any one can direct you to Briarcliff, which is about six miles away.

To reach it by railroad: Those who go by train should take the Putnam Railroad at One Hundred and Fifty-fifth street. Get off at East View, where a stand is being erected, or at Briarcliff.

Another way to reach the course is to take the New York Central, Hudson Division, to Scarborough, and drive about two miles to the Briarcliff Inns. Unquestionably, these will be filled to overflowing, and, therefore, rooms should be engaged now.

The Harlem Railroad reaches Valhalla, a small station about a mile beyond White Plains. This brings you at a point in the course from which an excellent view can be had of the race.

There are other points, reached both by trolley and railroad, but the three mentioned above give the best hotel accommodations. Those who decide to witness the race from East View will find accommodations at the Florence House, Tarrytown, from which arrangements have been made to take people to the course.

CONNECTICUT WANTS VANDERBILT CUP RACE.

BRIDGEPORT, CONN., April 7.—At the annual meeting of the Bridgeport Automobile Club, held last night, F. T. Staples was elected president. The club is greatly interested in the effort to secure the Vanderbilt Cup Race for Connecticut. Highway Commissioner James B. McDonald was present at the meeting and stated that in his opinion Connecticut had the roads for such a contest. A. L. Riker was selected as chairman of a special committee to look into the matter of a course.

Maja Entrant on a Picturesque Briarcliff Stretch.

FIFTH ANNUAL A.A.A. RELIABILITY TOURING CONTEST

FRANK B. HOWER, chairman of the A. A. A. Touring Board, has promulgated the rules for the great national trade and pleasure run of 1908. Giving its new and official title, however—a matter of no little significance, by the way—it will be known as the "Fifth Annual Reliability Touring Contest of the American Automobile Association." It also includes the contest for the Charles J. Glidden trophy for touring cars, and the Hower trophy for runabouts.

It will start at Buffalo, July 9, and end at Saratoga, on or about July 24.

Entries will close with Chairman Hower at noon, July 3, at the Touring Board office, 760 Main street, Buffalo. The entry fee for each car is \$200 and must accompany its nomination. Numbers for the tour will be issued in the order of the receipt of the entries.

The rules for this year's contest, which were framed after consultation with and approved by manufacturers of various affiliations, embracing makers of different cars, present not a few noteworthy changes from those of last year, and to some considerable extent show signs of the rule-makers having given some heed to last year's criticisms and complaints.

The most radical innovation is that calling for a classification of the contesting cars by price, accompanied by a corresponding variation of the daily miles per hour scheduled for the different classes of entrants, for both the Glidden touring car and the Hower runabout trophies. Touring cars have been divided as follows:

- Class A.—Cars valued at \$3,500 and upwards.
- Class B.—Cars valued at \$2,500 and up to \$3,500.
- Class C.—Cars valued at \$1,500 and up to \$2,500.
- Class D.—Cars valued under \$1,500.

In the matter of time schedule requirements when the running time shall exceed 7 1-2 hours, the running time will be:

- Class B.—Will exceed that of Class A 15 minutes.
- Class C.—Will exceed that of Class A 30 minutes.
- Class D.—Will exceed that of Class A 45 minutes.

When the daily running time shall be less than 7 1-2 hours, the running time will be:

- Class B.—Will exceed that of Class A 10 minutes.
- Class C.—Will exceed that of Class A 20 minutes.
- Class D.—Will exceed that of Class A 30 minutes.

Runabouts have been divided as follows:

- Class A.—Cars valued at \$1,500 and upwards.
- Class B.—Cars valued under \$1,500.

When the daily running time shall exceed 7 1-2 hours, the running time of Class B will exceed Class A 15 minutes.

When the daily running time shall be less than 7 1-2 hours, the time of Class B will exceed that of Class A 10 minutes.

The running time will be posted the night before and each contestant must calculate his own schedule.

Another radical change lies in absolving cars detained by tire troubles from penalization for tardiness. Motors, however, must be kept running all the time the tire repairs are being made. If the motor stops or other work on the car be done, then there will be no raising of the penalizations.

This year official observers will have to be carried, who must make their reports each night. They will, to speak comprehensively, have to be identified with the entrants, if makers, as officials, employes or dealers. Non-trade entrants will also name observers for their cars, subject to the approval of the chairman. Observers will, of course, ride in makes of cars other than those entered by their nominees. They must remain with their cars at all times.

There will be no prohibition of a club making up its team of cars of a single make, as there was last year. A club

team must have at least three cars, but a club may enter several teams, if it so desires. This may add, it is easy to see, a factor of trade rivalry within a club.

Each entrant must be a member of the American Automobile Association. If a contender for the Glidden trophy, he must belong to a club affiliated with the A. A. A.; but if a Hower trophy candidate he need only be an individual member of the national organization.

Spare parts used in making repairs and replacements must have been carried on the car and included in the catalogue list submitted to the chairman. No repairs or replacements can be made at the night controls.

The acceptance of outside assistance in an emergency is covered by the following rule:

Where road conditions are so bad that a car cannot get sufficient traction to move, or is ditched, after reasonable effort has been made to extricate it, towing or other external means may be used to relieve the immediate distress only, but under no circumstances shall a car enter a night or any other control except under its own power. Where towing, or assistance from any external source has been received by the car, its observer must make a full and complete report, giving time, place, conditions, length of tow, and any other important details.

Candidate cars for the Glidden and Hower trophies will have to be given into the hands of the chairman at Buffalo 24 hours before the start of the contest for official examination and the checking of its list of spare parts carried.

The route will be marked as formerly by confetti: "Each day's tour will be preceded by a pacemaker's car, and any entrant or representative thereof who passes the pacemaker will be disqualified. If the pacemaker's car breaks down, or is compelled to travel at a rate of speed so slow as to impede the progress of the tour, his flag shall be transferred to the first car overtaking him, which car shall thereafter become pacemaker's car subject to the same conditions."

Provision is again made in this year's rules for a running off of any ties that may arise at the end of the Hower trophy competition.

The scheme of penalization is along the lines of that of last year. Each team is given an initial credit of 1,000 points. There is a penalization of a point for each minute or fraction thereof of tardiness at controls in excess of 2 minutes, and a point for each dollar or fraction thereof of value of parts used in replacements as per manufacturers' catalogues. These points of penalization are divided in each case by the number of cars constituting a club team.

Checking stations will be established along the route, but only so far as to prevent racing. Each driver will receive a card when checking out in the morning, which will name checking stations, so he can estimate his running time during the entire day.

Thos. Cook & Son will again have charge of hotel arrangements. Each entrant will have to take care of and handle such baggage as he and his guests may need.

"GOOD ROADS" HOOPER "PENNSY" PRESIDENT.

LANCASTER, PA., April 4.—At the annual meeting of the Pennsylvania Motor Federation, held at the Hamilton Club, this city, Saturday last, Robert P. Hooper, chairman of the A. A. A. good roads committee, and treasurer of the Automobile Club of Germantown, was elected president for the ensuing year. The other officers chosen are: Dr. S. T. Davis of Lancaster and Peter A. Meixell of Wilkes-Barre, vice-president, and Paul C. Wolff of Pittsburg, secretary and treasurer. Norristown and Williamsport clubs were elected to membership. Twenty clubs now belong to the federation. Over 2,000 members are now enrolled.

THE POWER AND SPEED OF RACING CARS

By HERBERT L. TOWLE, MEMBER SOCIETY OF AUTOMOBILE ENGINEERS.

A SHORT time ago a case was tried in New York City, which concerned a racing car of high power, for which the defendant in the suit had refused final payment on the ground that the car had failed to perform as expected. It fell to the lot of the present writer to analyze the more prominent features of design in the car in dispute, and determine whether or not they could be made satisfactory without radical reconstruction.

The car had made no sort of a speed showing under test, and one reason for this, which would have been enough even had the car been otherwise perfect, was found in the gear ratio. The motor was asserted by its designer to be capable of developing considerably over 250-horsepower. It might, in reality, have gone as high as 120- or even 150-horsepower, if the crankcase had not cracked, and if the camshafts had not been so light and springy as to demoralize the valve timing. But the rear wheels, which were 34 inches in diameter, were geared to make two turns to the engine's one. In other words, the engine had to overcome a leverage (even neglecting gear losses) double that against which it would work with 1-to-1 gearing; and at the

step further, and show how the right gear might have been determined without great labor or experiment, and using only data available to the designer when the car was built, a year and a half ago. Since that time, record performances have been made which make the selection of a proper gear somewhat easier; but, so far as the writer knows, no quick method of calculation has been pointed out which is of general application. Therefore, the method used by the writer in the above connection seems to be of interest. It is based on the determination of tractive effort—i.e., road plus wind resistance, or the equivalent of the drawbar pull of a locomotive.

Power is the product of force and velocity. The tractive effort in pounds, multiplied by the car's velocity in feet per minute and divided by 33,000, is the horsepower developed at the rear wheels. This power, plus that lost in transmission, is the brake power of the motor at that speed. This neglects slip, but for beach work that is not material.

According to data, for which the writer is indebted to Thomas J. Fay, the net mean effective pressure of a motor of

POWER, SPEED AND TRACTIVE EFFORT OF CARS AT ORMOND, JANUARY, 1905.

Name of Car.	Cylinders	Bore	Seconds Per Mile	Miles Per Hour	H.P. a if Piston Spd. = 1,100 ft. M.E.P. = 67 lbs.	H.P. b if Piston Spd. = 1,000 ft.	H.P. a x K.	H.P. b x K.	Tractive Effort (a)	Tractive Effort (b)

For piston spd. 1,000 ft. per min.: $\text{H.P.} = \frac{D^2 C}{2.5}$. C = No. of cyls. K is transmission efficiency. T is tractive effort. 1 H.P. @ 1 mile per hr. = $\frac{33,000}{88} = 375$.

highest velocity which the car could be expected—even by its designer—to attain, the engine speed would be far too low to permit developing the maximum power.

Let us illustrate by supposing a case: At 80 miles per hour, on level macadam, a car having side chain drive shows a rear wheel slip of about 3 or 4 per cent. On the beach (for which the above car was designed) the slip and rolling resistance are both less, the same gear giving a car speed of about 86 miles an hour. Allowing, in round numbers, 2 per cent. for beach slip, a 34-inch wheel makes 600 turns in one mile. At a mile a minute, this would be 600 r.p.m., and at two miles per minute 1,200 r.p.m. With the 1-to-2 gearing described, the engine would make 300 and 600 r.p.m. in the two cases. But an engine having a stroke between 6 and 7 inches should run between 1,000 and 1,100 r.p.m., having due regard for risk of breakage due to piston inertia; so that the power actually developed would not suffice to drive the car at the highest speed. The designer of the car stated in his testimony that he expected to achieve a speed of 150 miles per hour; but at that speed the engine would run only 750 r.p.m., and would develop, at best, three-fourths of its maximum power. As a matter of fact, it would evidently fail to drive the car anywhere nearly as fast as it might with proper gearing, or the balance between driving torque and road plus wind resistance being struck at some extremely moderate speed.

It was not difficult to show that the gear ratio chosen by the designer was farcically incorrect; but it was desirable to go a

racing dimensions—that is, the indicated M. E. P. multiplied by the mechanical efficiency of the engine—cannot be relied on to exceed about 67 pounds to the square inch. In moderate-sized motors—say, below 5 inches bore—higher compression is feasible, bringing the net M.E.P. up to 70 or 75 pounds. A handy formula is:

$$\text{H P} = \frac{D^2 \text{ L R C P}}{1,008,500} \text{ in which}$$

- D is piston diameter in inches.
- L is stroke in inches.
- R is revs. per minute.
- C is number of cylinders.
- P is net M. E. P.

Assuming a piston speed of 1,000 feet per minute, and 67 as the value of P, this formula leads directly to the A. L. A. M. formula

$$\frac{D^2 C}{2.5}$$

For a piston speed of 1,100 feet per minute, we have

$$\text{H P} = \frac{D^2 C}{2.27}$$

The power developed by any racing motor, or certainly any motor built between two and four years ago, is likely to fall within or very close to the values given by these formulas. It is true that the powers thus calculated often fall considerably

short of the reputed power of particular motors, but that need not worry us, particularly in connection with the present subject. It was quite a common fault with the motors of a few years ago to disappoint their designers in this respect.

An Analysis of the Florida Speed Efforts.

Nearly all the best speed records at Ormond Beach were made in January, 1905. A few were made in 1904, and in 1906 the eight-cylinder Darracq put the highest mark for a gasoline car at 122.44 miles per hour, where it has since remained. All but the last of these records were made before work on the racing car above mentioned was begun. The cylinder dimensions of most of these cars had been published, and it was, therefore, easy to calculate their approximate horsepower by the above formulas, assuming 1,000 and 1,100 feet per minute piston speed. From these the power developed at the rear wheels followed by deducting a suitable percentage for transmission losses. So far as the writer is aware, no reliable published data were available two years ago on transmission losses, but 25 per cent. appears a fair average. So long as similar cars are considered, its precise value is not important, since its only effect is to scale all the computations up or down alike and on that account it is not at all necessary to take it into consideration in the present connection.

From the best speed of the car, and the computed horsepower at the rear wheels, the tractive effort was obtained by the formula:

$$T = \frac{375 \times H P \times K}{\text{Miles per hour}}$$

in which

- T is tractive effort in pounds.
- H P is engine brake horsepower.
- K is transmission efficiency, or 75 per cent.

Fig. 1.—Relation between tractive effort and speed of standard racing car.

This formula is derived as follows:
One mile per hour is 88 feet per minute.

Tractive effort for 1 H P at one mile per hour is $\frac{33,000}{88}$ or 375 pounds.

Obviously, the tractive effort as thus derived is actual only if the motor actually developed the full power called for by the

formula. If the motor was not perfectly tuned up, or if it was overgeared, the car would run slower than it should, and the apparent tractive effort, being in inverse ratio to the speed, would be correspondingly greater than the actual. Similarly, a motor exceptionally well tuned, or speeded to run faster than usual, would result in a higher car velocity; but this higher velocity, though in reality accompanied by increased tractive effort, would not appear thus on calculation, since the formulas take no account of unusual M. E. P. or engine speed. On the contrary, the apparent tractive effort would be less instead of greater. For this reason, the method is only safe as a means of obtaining averages from a considerable number of cars. When thus used, however, the apparent tractive efforts may be plotted, and a curve drawn, which will fairly represent the speed and tractive effort for any new case.

The above process was followed for the cars enumerated in the table. It will be seen that for the Mercedes and Fiat cars, which preponderate, the apparent tractive efforts lie very close together in the diagram. In all cases the tractive efforts have been calculated for both 1,000 and 1,100 feet piston speed. Of the cars which lie conspicuously outside the curve, two—the Fiat, driven by Sartori, and W. K. Vanderbilt, Jr.'s Mercedes, in 1905—were evidently not working at their best. The third, the Decauville, was about 700 pounds under the racing weight to which the others closely conformed, and its very low tractive effort is thereby explained.

A curve of tractive efforts was first sketched in by hand, and then was found by trial to conform very closely to the formula:

$$T = .035 W + .0017 A V^2$$

in which

- W is a total weight of car and driver, taken as 2,600 pounds.
- A is front area of car and driver, taken as 10 square feet.
- V is velocity of car in miles per hour.

The first expression of the formula represents the road resistance, the second the wind resistance. The coefficients, of course, are subject to change, but for average conditions, as represented by cars of Mercedes form, the curve seems to fit quite closely. As finally drawn in, it represents the formula accurately. It will be noted that the Simplex, driven by the unfortunate Frank Croker, appears in the diagram very close to the curve. I am told by Mr. Fay, the designer of that car, that it actually developed the horsepower and speed credited it in the table, so that it gives a good check on the correctness of the curve at that point.

A Curve of Tractive Efforts for Universal Use.

We thus have a curve to which we can determine approximately the performance and required gear ratio of any racing car of standard type. Suppose we have an eight-cylinder motor of six inches bore and stroke, designed to stand a speed of 1,200 r.p.m. and develop its full torque at that speed. This is 1,200 feet piston speed, or one-fifth greater than the A. L. A. M. formula assumes. The power, therefore, will be:

$$H P = \frac{D^3 C}{2.5} \times 1.2 = 138.$$

At the rear wheels it will be $138 \times .75 = 103$.
By our formula:

$$T = \frac{375 \times 103}{\text{Miles per hour}} = \frac{38,600}{M P H}$$

This enables us to determine the speed at once by applying trial calculations to the curve. Thus for 110 miles per hour, the tractive effort required by the curve is 296 pounds; that obtained by calculation, 350. For 120 miles per hour, we have 335 pounds required, and 321 available. For 118 miles per hour, we have 328 required, and 327 available. Therefore, 118 miles per hour will be our speed, representing 1180 revs. per minute of the wheels. This is so near the engine speed that it may not be worth considering, but if the driving bevel could be made one tooth smaller than the driven, to permit the engine to turn a very little faster than the wheels, some advantage might be

gained; or the difference could be adjusted between the gears and sprockets.

Up to this point we accomplish little by the method proposed that might not be more directly reached by a simple horsepower speed curve, such as may readily be constructed from the curve of tractive effort (See Fig. 2). Working on the tractive effort curve, however, has two advantages. It separates clearly the driving force required to overcome wind resistance from that absorbed by the beach itself. The latter works out by the formula to about 90 pounds for cars weighing 2,600 pounds complete; and, so far as the writer is able to learn, this is not far wrong. By separating these two elements in the total resistance, we are able readily to adapt our calculations to cars of other than the Mercedes-Fiat weight and front area.

The second advantage of using the tractive effort curve is that it enables us to ascertain at once,

Fig. 2.—Relation between motor horsepower and speed of standard racing car.

within close limits, the speeds obtainable with incorrect gear ratios. In doing this, it is only necessary to know how the M. E. P. developed by the engine at the car's actual speed compares with that expected under correct conditions. If there be no material difference, we simply calculate the mean torque developed by the engine, multiply it by the product of the mechanical efficiency and the gear ratio, and divide by the rear wheel radius, thus obtaining the tractive effort. From this, the attainable speed with that gear ratio follows at once by the curve.

To illustrate this point, let us assume the eight-cylinder 138-horsepower motor, above supposed, has been geared to make 8-10 of a revolution to one turn of the rear wheels. One horsepower at 1,200 r.p.m. giving a torque of:

$$\frac{33,000 \times 12}{1,200 \times 2 \times 3.1416} = 52.5 \text{ inch-lbs.}$$

Therefore, a motor developing 138 horsepower at that speed will exert a torque of $52.5 \times 138 = 7,250$ inch-lbs. Multiplying this by 75 per cent. and dividing by the wheel radius (17 inches) and gear ratio, we have

$$\frac{7,250 \times .75 \times .8}{17} = 256 \text{ lbs. tractive effort.}$$

On the curve, Fig. 1, this corresponds to a speed of about 98 miles an hour, as against 118 for the correct gear. At that speed the motor would be running $980 \times .8 = 786$ r.p.m.

If the motor be undergeared so that it makes 1.2 revolutions to one turn of the rear wheels, we shall have

$$\frac{7,250 \times .75 \times 1.2}{17} = 383 \text{ lbs. tractive effort.}$$

This indicates a velocity of about 133 miles per hour, provided the motor maintains its torque at the excessive speed—1,600 r.p.m.—which it will have to develop, and provided it does not break down somewhere from the violence of the piston inertia forces, which augment as the square of the speed, and are, therefore, 78 per cent. greater at 1600 r.p.m. than at 1,200 r.p.m.

To illustrate further, let us suppose that the engine which figured in the lawsuit above mentioned had been able to give 120 horsepower at 1,000 r.p.m. This represents a torque of 7,570 inch-pounds. Assuming a transmission efficiency as high as 75 per cent., despite the adverse gear ratio, we have:

$$T = \frac{7,570 \times .75}{17 \times 2} = 167 \text{ lbs. for 34 inch}$$

wheels. This tractive effort will give a speed of only 67 miles an hour, at which the engine speed would be but 335 r.p.m. At that speed the torque would probably be considerably below the normal, which would cause the actual speed to be still less. If the actual torque were 20 per cent. below the maximum, the tractive effort would be $1,674.8 = 124$ lbs., representing a car speed of 50 miles per hour. What the torque really was can only be guessed, as the motor was never tested; but the retarding effect of an excessively high gear is plain.

It will be noted that calculations, which do not assume some definite speed for the motor, but aim only to ascertain what car velocity can be attained with a certain gear ratio, cannot be made from the horsepower-speed curve, since the horsepower which will be developed is not known. On the other hand, if we arbitrarily fix the engine speed, we thereby fix its power, and can, therefore, determine the proper gear ratio from the car speed given by the power-speed curve.

To show their character, the curves of tractive effort and horsepower have been extended to their values for a speed of 160 miles per hour. At the present time, any such speed is merely speculative, and calculations regarding it must await the confirmation of practice. However, it is of interest to note that 527 pounds, the calculated tractive effort for 160 miles per hour, is close to the slipping point for rubber tires on macadam, assuming average weights on the rear wheels of racing cars. Apparently, therefore, that speed is near the theoretical limit unless rear wheel weight be increased. From the horsepower required, it is evidently quite close to the practical limit likewise.

CONCERNING SHAFT VERSUS CHAIN.

Inch by inch, or, perhaps, it would be better to say link by link, chains are giving way in the battle for transmission supremacy abroad, says *Motor Talk*. Chains may well cry to be saved from their friends, for verily some of their champions treat them most shamefully. Too much confidence in the chain's durability and efficiency leads apparently to the most disgraceful neglect. If driving chains had no more important duty to perform than to keep a dog in his kennel, there would no fault be found with their neglect; but where is the sense, I should like to inquire, in paying the most elaborate attention to one end of the car—the motor end—timing the valves to half a hair-breadth, finishing off the valve seats with crocus powder, etc., and then leaving the chains to grind themselves to pieces in all the grit and mud they can collect? Power microscopically conserved in one place only to be wasted in the most uncalled-for manner at another! There cannot be so very much power lost, say the wise ones, otherwise chains would wear out quicker. Such wisecracks cannot appreciate the difference in efficiency between a new chain and one that is stretched out of pitch. In fact they hardly know what pitch means, except in the vaguest kind of a way, until some day the chain mounts the teeth and crumples up a stay rod.

COMPARING AMERICAN AND FOREIGN LIGHT CARS

By G. H. GODLEY.

TO the American observer, one of the most striking features of the English and French trade is the great demand for small four-cylinder cars of from 12 to 20-horsepower. These cars form a distinct class, and by no means an unimportant one, which is almost entirely unknown here. They are, in the main, designed along the lines of standard touring cars of higher power, but often a surprising amount of ingenuity is shown in the simplification of details.

These motor cylinders are cast either separately, in pairs, or *en bloc*, with a pronounced tendency toward the last method. The Darracq has the four cylinders, and their inlet and exhaust piping all in one casting. Magnetos form a part of the regular equipment on many cars, and provision is made for them on practically all the others. Air-cooling is unknown, but in some cases the water-cooling system has been simplified by the omission of the pump, the water circulating naturally, and often the radiator fan has been dispensed with also. Clutches are of different patterns, cone types being rather in the majority, with the multiple disc a close second, but there are also a number of special designs. Change gears are sliding with three forward speeds, often selective. Drive is almost invariably by shaft and live axle. Some makers, on account of the excessive cost of the drop-forged I-section front axle, have adopted a built-up design formed of two channel sections riveted together, back to back. Frames are usually pressed steel, carried on semi-elliptic springs in front, and either semi-elliptic, three-quarter, or platform springs in rear. The dimensions of a number of representative cars are given in the following table:

Name	H.P.	H.P. by Formula	Bore and Stroke mm.	Wheel-base In.	Tires In.	Chassis in London £
Argyll.....	14-16	20.1	.90 x 120	100 1/2	810 x 90	325
Darracq.....	14-16	17.9	.85 x 100	100	760 x 90	335
De Dion.....	12-14	14.0	.75 x 100	108	810 x 90	330
Gladiator.....	12-14	15.9	.80 x 110	100	810 x 90	325
Gregoire.....	10-14	15.9	.80 x 110	96	810 x 90	304
Gregoire.....	16-20	20.1	.90 x 120	103	{ 875 x 105, front 880 x 120, rear }	400
Horbick.....	12-16	15.9	.80 x 90	96	810 x 90	300
Humber.....	10-12	17.5	.84 x 95	102	760 x 90	{ 250 with body }
Mors.....	10-14	15.9	.80 x 90	102	820 x 90	350
Panhard.....	10-15	15.9	.80 x 120	112	{ 870 x 90, front 880 x 120, rear }	400
Renault.....	10-14	14.0	.75 x 120	107	{ 800 x 85, front 810 x 90, rear }	410
Scout.....	15	20.1	.90 x 115	112	810 x 90	355
Unic.....	16-20	18.7	.87 x 110	118	810 x 90	415
Vulcan.....	14	19.6	.34 x 4 1/2	102	810 x 90	315
West-Aster.....	14-16	17.5	.84 x 110	102	810 x 90	345

The only American cars which would come in this class are the 16-horsepower Franklin and the 16-22-horsepower Thomas town car—both too well known to need description.

American Makers Have Developed Horizontal Type.

Instead of this type, American manufacturers have developed cars with two-cylinder horizontal opposed engines, placed either under the seat, with center chain drive, or in front, with shaft drive. It is true that these cars are usually considerably cheaper than the foreign cars listed above, the prices of the American type varying from \$1,250 to \$1,500, while the foreign type, after a body had been fitted, would average over \$2,000. There is one significant exception, however—the Humber. This car has a very wide reputation in England, and is undoubtedly of the very best construction throughout, yet by standardization and manufacturing in quantities its makers have been able to sell it, complete, with touring body, at £250, equivalent \$1,215. I take this to be sufficient proof that American manufacturers of small cars could do the same if they desired to replace their two-cylinder models by four-cylinder ones.

The question then stands: Which of these two types would be preferred by the average man about to spend \$1,250 on a car? There are several considerations on both sides. In the first place, the two-cylinder has comparatively large cylinders, with much less wall surface than a four-cylinder of the same

piston displacement. They also run at a lower speed. Consequently, other things being equal, the two-cylinder is the more economical, both in fuel and oil. If batteries are used for ignition, it is also more economical in current. Of course, no estimate can be made of the actual saving, but it would certainly be very noticeable on a monthly bill.

On the other hand, the four-cylinder car has the advantage in both silence and smooth running. Two-cylinder cars have made wonderful improvement in this respect, but from their very nature they can never hope to equal the four-cylinder. Another advantage of the latter is the use of shaft drive instead of center chain. A number of two-cylinder cars are now built with motor in front and shaft drive, but with a good-sized engine the narrowness of the available space makes necessary a very short stroke, with consequent loss of the efficiency and economy of this type. Further, the removal of the engine from under the seat allows the body to be hung much lower; this, together with the increased wheel-base, makes a great improvement in appearance and comfort. The old fallacy, that a short wheel-base, and high, full elliptic springs are peculiarly adapted to American conditions, has long been exploded.

Necessity for Simplicity Is Self-evident.

As cars of this size are almost invariably driven by their owners, they must be as simple and easily cared for as possible. This condition seems at first to favor the two-cylinder. However, the horizontal opposed engine is, by its nature, spread out over three or four feet of space, with many long pipes and wires, which even the best designing cannot keep straight and clear. The new four-cylinder engines, on the other hand, and especially those *en bloc*, are so neat and compact that they seem much simpler than the others, while pipes and wires are remarkable chiefly through their scarcity. When the hood is lifted, the four spark-plugs stand up in a row, ready to the hand, instead of one being under the footboard and the other under the tonneau.

The choice lies, then, between economy of fuel and oil on the one side, and comfort, appearance and accessibility on the other.

Economy is doubtless an important consideration, but here it is outweighed. The day has passed when an automobile of any sort whatever was sufficient to glorify its possessor. The business man who has \$1,250 to invest in an automobile wants one which will compare in style and comfort, if not in speed, with the more expensive ones, and he will not haggle over 10 per cent. on his gasoline and oil bill.

The two-cylinder horizontal opposed engine is now finding its proper field in the auto-buggy, and I think it is a pretty safe prophecy that it will soon die out in the touring car. And, meanwhile, there is a great opportunity for the manufacturer who does in America what Argyll, Horbick, Humber and others have done in England.

STEADY INCREASE IN AUTO EXPORTS.

Government statistics for the month of February, 1908, compiled by the Department of Commerce and Labor, show that 213 complete automobiles of a value of \$368,309, were sent out of the country, as compared with 151 cars of a value of \$301,240 for the same month a year previous. During the same periods, the value of the automobile parts exported reached \$75,394 in 1908, and \$47,124 in 1907. For the period of eight months ending with February in the years 1906, 1907 and 1908, the total values were \$1,771,313; \$2,873,246 and \$3,061,823 respectively. The most striking feature of the February, 1908, report is an increase of more than 100 per cent. in the value of the cars exported to Italy, although France also shows an increase of about 12 per cent., and other European countries are taking American cars.

LETTERS INTERESTING AND INSTRUCTIVE

QUERIES ON A NUMBER OF TOPICS.

Editor THE AUTOMOBILE:

[1,290.]—I write to you for information in regard to an article on "The Rubber-Knobbed Tire," by A. E. Morrison. Would write to him direct, but do not know his address. Who are the manufacturers of this tire, and is it in general use? Would like the editor's opinion concerning its durability.

How should one make a test to show the amount of current being consumed in operating coil? By placing the ammeter between the screw at base of trembler and the upright holding adjusting screw, thus cutting out the trembler, I find the ammeter always reads the same as is shown in testing the cells, so conclude it is not the correct method. My machine consumes an enormous number of cells. Placed another coil on it, but the tremblers on the new coil were so stiff that none but brand new cells seemed able to operate it at all, and these only in a very imperfect manner. Would it be advisable to grind down or weaken these tremblers, or is it probable that the trouble lies in the internal construction of the coil, which is so made that each unit contains two cores, i.e., two primary and two secondary windings?

Should not an exhaust valve seat more than 1-16 inch on the valve seat? The valve has nearly 1-4 inch bevel, but seats only on the very edge, and I am able to get but little compression in the corresponding cylinder, although cylinder wall and piston is in good condition. It looks to me like faulty construction, but the makers of the machine will give me no satisfaction. I have been told by repairmen that a larger valve will have to be used and a new seat bored, since the small valve has ruined the old valve seat.

Is there on the market any cable dressing which will prevent the cables of a cable-driven machine from slipping? The makers of the machine guarantee in their catalogue that the cables will not slip, but this is not true, as the makers well know, for they have printed instructions to send owners of their machines, when they begin to klick, telling them to sprinkle cables with ashes or rosin—a pleasant pastime on a muddy road.

Glyndon, Minn.

L. M. LOWE, M.D.

We are under the impression that what Mr. Morrison had in mind is what is known as the "Bailey tread," the shoe of the pneumatic tire being molded in series of round, flat-topped projections, which give it a better grip on the road, particularly where the surface is slippery. Quite a number of the tire manufacturers list tires with these treads.

Connect the ammeter in series, i.e., simply disconnect the primary wire leading from the battery to the coils and place the ammeter in the gap thus made, connecting the wire to one of its terminals and touching the coil terminal with the connection of the instrument. The motor should be running while the test is being made, as a test made with the motor stopped is no indication of what the consumption may be. A properly designed and adjusted coil should not require more than .5 to .7 ampere to operate it. Write the makers of the coil for information, stating the nature of your trouble, as each type has its peculiarities.

We believe it is customary to make exhaust valve seats at least 3-16 to 1-4 inch wide. It looks to us as if the repairman's diagnosis was correct. There are numerous dressings on the market, intended to prevent leather belts from slipping, but we do not know that there is any compound of this kind that is made for the same purpose where cables are concerned.

FURTHER DATA ABOUT A MOTOR.

Editor THE AUTOMOBILE:

[1,291.]—In using the dimensions stated in letter No. 985, in your issue of November 28, 1907, will you please tell me what the compression would be, and also the horsepower and the speed of the engine?

Worcester, Mass.

F. BALL.

Assuming the combustion chamber to represent 30 per cent. of the total piston displacement of the motor in question, the compression (gauge pressure) would be slightly over 70 pounds to the square inch, or about 85 pounds absolute. The indicated horsepower would be 20 in round numbers and the speed 1,500 r.p.m.

EXPLANATIONS ARE NOW IN ORDER.

Editor THE AUTOMOBILE:

[1,292.]—Kindly explain the following, which strikes me as very peculiar and somewhat disconcerting to the fellow who is just trying to find out. About a year ago I bought an ammeter of French make, which reads up to three amperes, by tenths. I have used this when adjusting the coils on my car, adjusting each unit until it showed .7 ampere. Running the engine would show a consumption of .4 ampere. That to me was satisfactory, the engine ran well and I got good long life from my dry cells.

Some weeks ago I loaned my ammeter to a friend. He used it in adjusting his coils, and was so well pleased that he spent some of his good money and bought a similar meter. This was of American make, and showed 4 amperes also by tenths. He took this home and was surprised to find that the adjustment which showed, under continuous current, .7 ampere with the French meter only showed .5 with the American. He brought the meter to me and my results were the same, and on my car when the engine was running the French meter showed .4 and the American .25. Note that in every case the American meter showed the lowest consumption.

Now comes the surprising part of my story. Being anxious to know which meter was more nearly correct, I carried both into a well-known electrical supply house and asked if they could test them for me. They were very obliging, and made a test in my presence, which showed, in amperes:

Their Standard	The French Meter	The American Meter
1.00	1.00	1.25

This was very good for the French meter, but reversed the position of the two, making the American read the higher. This did not satisfy me, so I took both meters to a well-known manufacturer of electrical meters and had him make a test. His results were as follows:

Standard	French	American
1.00	.85	1.10
2.00	1.80	2.30
3.00	2.80	3.50

This also makes the American meter read the highest.

The voltage on my car comes from four dry cells in series, and as they have now been in use for some time it probably does not exceed five. The first test was made by using one dry cell (fresh) and was probably one and one-half volt. The second test was made with (I believe) one-half volt. I mention these as they may have had some bearing on the matter.

However, I am "all at sea" and will appreciate any explanation which may come to hand through "Letters Interesting and Instructive" as to why the meter showing the higher reading under test shows the lower reading in actual service.

New York.

"FOUR-CYLINDER SAIL."

Assuming that tests of the different ammeters were always made under the same conditions, which was doubtless the case, we must confess ourselves to be equally "at sea," and, accordingly, invite explanations from those of our subscribers who think they can throw any light on the subject.

A CHANCE FOR MAKERS TO EXPRESS OPINIONS.

Editor THE AUTOMOBILE:

[1,293.]—If I may have the necessary space in your next issue, I should like to ask the following questions of the various automobile manufacturers and others:

First: I should like to have some of them inform me as to why it is that there are not more of the high grade cars driven by air-cooled engines? Is it a case of prejudice, precedent, or inability to see the good and efficient work done by the greater part of the air-cooled automobiles now on the market? I realize that it would be hard to convince the entire buying public of the good features of the air-cooled engine, or any other entirely new feature of construction, for any given make of car all at once, but if some half-dozen or more manufacturers of high grade water-cooled cars would put out an air-cooled engine as an option, and push that option, it would not be a great while before the major portion of the cars sold would be equipped with air-cooled engines.

I should like to hear from some of the manufacturers of high grade cars as to their views of the matter. FRED B. FAY.

Worcester, Mass.

The frequency with which "air-cooled" questions have come to light within the past few weeks leads us to place the following opinion on record, and we trust that manufacturers of air-cooled cars will correct us, if necessary, or supplement it by their

own views. In reality, the following is a statement of fact, and not merely an opinion. The air-cooled car has shown itself to be eminently practical, highly efficient, more economical in fuel consumption than the water-cooled type and fully as reliable as the latter. A great number of the victories in automobilic contests held in this country stand to the credit of air-cooled cars. Regarding the prevalence of the water-cooled type, we think the matter can be most easily explained by the fact that the average manufacturer of automobiles is in business to make and sell cars, and though he may have very decided opinions of his own, he is quite willing to make what the public wants. In other words, it appears to be more difficult to sell air-cooled cars, and makers generally prefer to work along the line of least resistance rather than undertake an expensive educational campaign. The water-cooled car was already on the scene in numbers before the air-cooled began to make any impression, so that the former became the fashion, and its sway is hard to dispute. This is doubtless a basis of what may be termed a prejudice against it. Because A, B and C have bought water-cooled cars their friends do likewise, and, as the owners of air-cooled cars are in the minority, their influence is not so far-reaching. The air-cooled motor needs no defenders, as its record speaks for itself.

POOR WORKMANSHIP DECREASES EFFICIENCY.

Editor THE AUTOMOBILE:

[1,294.]—I am a subscriber to your valuable paper, and would like to have the following answered in "Letters Interesting and Instructive": Would it make any material difference in a two-cylinder opposed motor of 18 to 20-horsepower if, through imperfections in workmanship, the pistons did not come up into the explosion chamber within 1-8 of an inch of where they were originally designed to? I hold that it would, but my foreman says it would not. Which is right?

Also, I would like to ask about the Renault device for starting from the seat. As far as I could see from cut in the March 12 issue of "The Automobile" there was no provision made for backward motion of the shaft. Should think in that case that the motor would do considerable damage in case it should backfire.

A. K. W.

This would lower the compression of the motor according to the ratio that the distance in question bears to the length of the combustion chamber, as originally designed. It may be that the loss is actually negligible in the motor you speak of, though a brake test would quickly reveal it. Very small errors of construction are fatal to the efficiency of a motor when they affect its compression. Your foreman must have a very peculiar idea of the principles of the internal combustion motor, as if 1-8 inch loss would have no effect whatever, it would follow logically that any amount of error here would not reduce the motor's efficiency, and it would work equally well even if there were one or more inches added to the length of its combustion chamber, regardless of the designer's ideas in the matter. It may be that the dimension in question strikes him as being so small that it could not have any appreciable effect, one way or the other, but in a small, high-compression motor, such as is used on a motorcycle, it would mean a loss of fully 10 per cent., or more.

You evidently did not read the description of the Renault self-starting device very closely, as it reads, in part: "The pinion G, the rotation of which commands the crankshaft, is provided with a free-wheel ratchet device, shown in the separate drawing." This provides both for the disengagement of the self-starting device when the motor gets under way, and for taking it out of engagement should the motor "backfire."

IS ANYTHING GAINED BY USING HOT AIR?

Editor THE AUTOMOBILE:

[1,295.]—Please answer the following, through your "Letters Interesting and Instructive": I have a Schebler Model F carbureter which can be heated by the exhaust by putting on some pipe. Is anything gained by heating the mixture while passing from the carbureter to engine in cold or warm weather?

I would say in regard to letter No. 1,218 that I have had trouble

much like he has. To overcome it I put several thin pieces of leather between the float and the lower end of lever to which the float is fastened, so that it does not allow the gasoline to raise so high. Care must be taken that the float does not touch on sides of the float chamber. I also lowered the gasoline tank and raised carbureter, and everything is working right now. Have had no trouble with the carbureter since.

Could you tell me if a car registered in Alberta can tour in Montana and North Dakota without going to the trouble of registering in each State? If you have the laws of these States, please give most important parts in your answer.

High River.

E. H. SCHROEDER.

Ease of starting is gained by heating the mixture and condensation is prevented in cold weather, this being the case where the manifold is unusually long. The cold mixture is more effective, however, as the colder the air is the denser it is, and, consequently, the more oxygen it contains. Many foreign cars are so equipped that either hot or cold air may be used at will, while others circulate the cooling water round the carbureter to keep it warm, this being found on some American cars as well.

The Montana law, which became effective early in March, 1905, does not provide for registration, so that unless it has been amended in the interim, a foreign number is good there. This is also true of the North Dakota law, passed in the same year. The principal sections of both laws are: "Speed rates (Montana, 20 miles outside, and 8 miles an hour in cities; North Dakota, 15 miles outside, 8 miles inside, and 4 miles an hour on city crosswalks when persons are using same), Duties upon meeting horses, Definition of motor-vehicle, Punishment for violations, Muffler, lamps, bell, etc., Laws of the road," etc., which are virtually the same in both, and correspond to those generally embodied in laws of this kind throughout the United States.

SUBSTITUTING SILVER FOR PLATINUM.

Editor THE AUTOMOBILE:

[1,296.]—I have an Indian motorcycle, 1906 model. I lost the platinum out of the circuit breaker and the platinum is burnt or worn off the screw. Do you think that silver is a good substitute for platinum?

C. C. M.

Stockton, Cal.

If silver were an effective substitute for platinum it would be generally employed by manufacturers, as the cost is but a fraction of the latter. It will give good service in an emergency, as in case where the platinum contact has dropped out, or worn away entirely, but it is not proof against oxidation to the same extent, and will wear away much more rapidly, as it fuses readily.

WHAT CAR HAS THESE FEATURES?

Editor THE AUTOMOBILE:

[1,297.]—Is there an automobile manufactured in the United States that uses both the friction transmission and two-cycle motor?

JOS. H. STRAWN.

Star Junction, Pa.

We are under the impression that such a car is built in this country. If we recollect aright, it is of the high-wheel, or "buggyabout" type, but we cannot recall its name at the moment. If any of our readers can help us out, we will be pleased to publish their answers for the information of the inquirer.

HOW MUST BRAKES BE APPLIED LEGALLY?

Editor THE AUTOMOBILE:

[1,298.]—Will you kindly furnish me with the following information: Is there a law in any State requiring the application of brakes to the wheels direct on motor-driven vehicles? If so, in what State, and where can I secure a copy of the ruling?

Chicago, Ill.

J. A. HERZOG.

While a majority of the so-called motor-vehicle laws of the various States provide that automobiles shall be equipped with breaking devices, we do not know of any that specify in detail just what part of the car the brakes shall be applied to. Much of the proposed legislation of earlier days was of an extremely weird brand, and in it many of the Solons tried their hands at

specifying just how a car should be built, some thinking that the machine should be so constructed as not to be able to exceed a certain speed limit. None of these ever became law. If any of our readers are better informed on this subject, we should be pleased to hear from them.

EXPLAINING THE CARBURETER DIFFICULTY.

Editor THE AUTOMOBILE:

[1,299.]—Every time a tire "gets bad" or "blows out" it is immense satisfaction to know exactly the service it has given. Without a written record an estimate is either unjust to the owner or the manufacturer.

First, if the tire does not bear a serial number for identification, it can be permanently marked on the inside, using a wet sponge plus a heavy indelible pencil. The water will soak the marks deep into the canvas.

Next, for each tire numbered, prepare a large card similar to the following form, upon which the whole performance of the tire can be intelligently noted. For example, the first line to be the descriptive:

No. 100. Kind, 36 x 5, smooth tread. Bought of. 1/1/08. Cost, \$75.00

	Date	Wheel	Miles Registered	Total Mileage	Remarks	Total Cost
Put on . . .	1/15/08	Right rear.	1,000	Kind of car
Removed..	4/1/08	5,000	4,000	To factory for retreading, \$20.00	\$95.00
Put on . . .						
Removed..						
Etc.....						

Using heavy pasteboard cards and an indelible pencil will furnish a complete, accessible, and permanent record of each and every tire, and can be easily filed in a prepared rack. Believe that the tire manufacturer could please many of his customers by having a neat form printed similar to the above, as well as an advertisement for him.

ABOUT THE DEALERS AND THE SUPPLY HOUSES.

Editor THE AUTOMOBILE:

[1,300.]—In a recent issue of "The Automobile," I noticed an article regarding agent complaining that factories were selling cars direct to the consumers and sign contracts with any Tom, Dick, and Harry, in which case they used to form a club for buying a few cars at a time so as to fulfill the contract. Now, I think that agents and retailers also would have a reason to complain about supply houses selling supplies by mail direct to consumers. I, most of the time, found that when a consumer needs any accessories or supplies, he will ask for a catalogue price and then ask for the discount on it. In most cases, if they do not give him the discount that is given by the supply house, those parties will send to the supply house themselves and order what they want. I do not see any reason why the supply houses should limit themselves to do business with bona fide dealers only, as I am almost certain that the public would be buying just as much, regardless whether they could get it from the supply house or from their local dealer. Now, why could not retailers in automobile supplies, and garagemen, form an association, in which case each member would have to prove himself to be a dealer and running a garage or repair shop as a business. If this could be realized, it would be easier for the supply houses to know with whom they deal, and it would also be easier to keep a standard price on each and every article. As it is, at the present, with no fixed price on the products, one dealer will charge more and others less than the catalogue price, and I believe this to be the cause that the motoring public generally prefer to send to a supply house for their supplies, where they know that there is only one price.

I would like to hear the opinion of others on the same subject, as I really believe that sooner or later something must be done in this line so as to better regulate the trade.

ARTHUR BEIJER.

Phillips, Wis.

CONCERNING THE QUESTION OF TIRE HEATING.

Editor THE AUTOMOBILE:

[1,301.]—"Pneumatics," in his letter of March 26, on the heating of tires, goes at the subject in the right way, but I should like to take exception to some of his reasonings. He concludes that the heating is probably due to compression of the air in meeting obstructions, because "the causes of this super-compression follow one another with such rapidity that the attendant expansion has but slight cooling effect." This is rather hard to follow. There

must be as much expansion as compression, no matter what the speed, and it is an invariable rule that as much heat is lost in expansion as is gained in compression. On the other hand, I believe that a large part of the heat is caused by internal friction in the shoe—a possibility which "Pneumatics" dismissed without much consideration. Rubber is not perfectly elastic; consequently a large part of the work done in distorting it is transformed into heat. My conclusion would be that the heating is due both to internal friction and road friction, the proportion, of course, depending on the smoothness of the road.

G. H. GODLEY.

Cambridge, Mass.

DR. HARD ANSWERS HIS CRITICS.

Editor THE AUTOMOBILE:

[1,302.]—My critics are partly right. Billed down into a few words, a car is retarded most when the drive wheels make the motor run at the highest speed. But the all-round and most serviceable method of retarding the progress of the car by using the motor for a brake, is to simply cut out ignition and leave the high speed on. The Minneapolis critic requires no reply. The factors of resistance, such as compression, friction, etc., were correctly stated. Old tire casings placed on the wheels, as directed in my former article in "The Automobile" gave better results than any other way of protecting that I have seen, and I am not without experience. This letter will serve to answer the published criticisms, and also quite a number of private communications on these subjects.

A. D. HARD, M.D.

Marshall, Minn.

EXPLAINING THE CARBURETER DIFFICULTY.

Editor THE AUTOMOBILE:

[1,303.]—In answer to letter No. 1,218, I would suggest to him that he reduce his air in same way I did on Schebler carbureter, the air opening just above the valve is, I judge, about one-half by three-quarters. I took a small piece of tin and inserted it down inside air intake. Closing that opening to about 1-4 by 3-4, drilled small hole through pipe, fastened with small bolt, so it could not get out of adjustment. My motor will start now 8 times out of 10 on compression. Previous to my doing that I had same trouble he complained of. Was evident to my mind that the air valve did not begin to work until you speed up motor. Consequently, was getting too much air to start motor properly, or could not start motor at all until I cranked my head off.

A. C.

McKeesport, Pa.

ANOTHER EXPERIENCE WITH DECARBONIZER.

Editor THE AUTOMOBILE:

[1,304.]—Noticing in your "Letters Interesting and Instructive" an article on "Lubrication," and in letter No. 1,253, J. L. Williamson stated he believed he was the only one using decarbonizer in his oil. Last fall I had trouble with dirty and greasy plugs, and tried several things, but had to clean my plugs every day to get any kind of service until I tried decarbonizer in the cylinders and found it helped. Since November I have used a tablespoonful in each cylinder every two weeks, and also about 10 ounces of the same in every gallon of lubricating oil. As I drive a Winton and have no splash system, have had my plugs out once since November and found them clean but slightly colored, but never touched them.

H. LEASE.

Davenport, Ia.

WHY THE GASOLINE DRIPPED CONSTANTLY.

Editor THE AUTOMOBILE:

[1,305.]—In answer to letter No. 1,218, I should think your trouble is caused by a leaky carbureter, either from the setting of the float, or from the seat of the needle valve, thus allowing the gasoline to collect in the bottom of the carbureter. This would naturally drip out, as there are some small holes in the bottom of the Schebler carbureter—these must be stopped up.

When the engine is cranked it draws a lot of gasoline to the cylinders, which is too rich to explode, and thus the cranking continues until this gasoline is got rid of. I had this same trouble, which was remedied by regrinding the needle valve to its seat.

Providence, R. I.

E. T. P.

CARBON DEPOSITS CAUSED THE TROUBLE.

Editor THE AUTOMOBILE:

[1,306.]—I note in letter No. 1,277 that a reader asks if any other reader has had the same trouble F. R. Zeigler complains of in the March 12 issue. I have had the same trouble with my Ford. I found my trouble was carbon deposited in the carburetion chamber, and I found heavy carbon deposits around the valve seats, and after removing the carbon my engine ran like new.

Uhrichsville, O.

J. W. LYTLE.

BIRTH, DEVELOPMENT, AND FUTURE OF THE SIX

By C. C. HILDEBRAND.

ENGLAND has been generally credited with being the birthplace of the six-cylinder idea, but the records seem to indicate that the first car having a six-cylinder vertical engine was the "Gasmobile," which was built in this country and exhibited at the New York show of 1901. A search through the back files of the English trade papers does not disclose any word concerning the six-cylinder Napier previous to October, 1903, nearly two years later. The Standard Motor Construction Company built their first six-cylinder engine in 1902, and had it running in a boat in the spring of 1903. About this time two other American manufacturers built a six-cylinder car, but these were not successful nor satisfactory, and hence discontinued.

Although America can probably claim the honor of having made the first six-cylinder, the American makers were so sure that the one and two-cylinder cars had all the cylinders needed that they failed entirely to appreciate the value of the multi-cylindered engine. Therefore much of the credit for the present popularity of the "sixes" abroad must be given to the Napier company and the present popularity of the "sixes" in this country must be given to the Stevens-Duryea Company.

J. F. Duryea, who built the first successful automobile in America, has had vastly more experience than any other designer in this country. He realized long ago that the six-cylinder type eliminated intermittent torque, dead center and lack of balance—the three defects of the one, two and four-cylinder engines. The Stevens-Duryea Company, believing that the acceptance of the six-cylinder car in higher horsepowers would be general as soon as the public realized its advantages, disregarded the universal antipathy to "sixes" which has existed and began the development of a six-cylinder model far in advance of other makers.

The manufacture of the Stevens-Duryea "Big Six" was begun in 1905, which makes the Stevens-Duryea Company the first American manufacturer not only believing in the six-cylinder idea, but backing up their belief by manufacturing sixes and ordering material for over half a million dollars. The success of the "Big Six" was instantaneous, and the result of this success was evidenced by five American manufacturers making sixes in 1906. In the foreign field four manufacturers were building sixes. The design of the "Big Six" that was made in 1905 was so perfectly worked out in the drafting room that no changes in mechanism have been necessary up to this writing.

In the meantime the obvious superiority of the six-cylinder car resulted in a heavy demand for this type, and the Stevens-Duryea Company had produced the "Light Six" and were marketing both the "Big Six" as well as the "Light Six" while other makers were hurrying designs and testing out new six-cylinder models.

In 1907 the six-cylinder idea had so spread and manufacturers had so rushed to meet the increased demand for them that we find a total of seventy-seven foreign makers producing six-cylinder cars and many others working on them. In America there were exhibited forty-six six-cylinder cars at the New York show in 1907, and there are at the present time twenty-seven American concerns manufacturing six-cylinder cars. The fact that the people demanded sixes had the effect of bringing the manufacturers to time, and they ceased opposition and designed sixes.

At this time the Stevens-Duryea Company had hundreds of sixes in the hands of owners giving entire satisfaction. Some of the advantages of the six:

- It runs more slowly on high gear.
- It picks up speed faster and more easily on the throttle.
- It has much less vibration.
- It runs with a silence unknown to the four.
- It makes gear shifting almost unnecessary.
- It is decidedly better for hill climbing.

A thorough test of the Stevens-Duryea six through crowded streets, through stretches of sand, and over difficult hills will easily prove these statements to be true.

All mechanical engineers admit that the six has more flexibility than the four, on account of having a more perfectly balanced engine, and it is this perfect balance that produces absence of vibration and smoothness of running. This flexibility is also brought about by the power stroke overlapping each other. Before the first cylinder has stopped delivering power, in fact when the piston is about two-thirds of the way down, the second cylinder begins, and so on. This means that even when the engine is running very slowly the power is absolutely continuous, and that during three periods in each revolution two cylinders are working at the same time.

In the Stevens-Duryea sixes the unit power plant and three-point support are used, which are so designed as to secure unvarying alignment between the various points of the power plant, and if there is one thing that spells failure for a six-cylinder car it is to have the car so built that the engine and transmission are exposed to every twist and bend and strain that come with traveling over this country's strenuous roads.

At the present time there are eight hundred and fifty-eight Stevens-Duryea six-cylinder cars in use from Portland, Me., to Portland, Ore., and from Minneapolis, Minn., to Mexico City, Mex., all of which are giving entire satisfaction. It has been the experience of the Stevens-Duryea Company that anyone who has ever driven one of their sixes will never go back to a four, except for a smaller car, and this fact strongly shows the tendency of the future. They believe that anyone purchasing a four-cylinder car of more than 40 horsepower and paying more than \$2,750 for it, should buy a six. The single-cylinder, two-cylinder and four-cylinder engines will be used indefinitely to fill that demand, and it is the consensus of opinion of Stevens-Duryea owners, a great many of whom have owned two and four-cylinder cars and have driven in and are familiar with certain four-cylinder types higher in price even than our Model U, that after every such experience they have invariably returned to the six-cylinder with added enthusiasm. The flexibility, smoothness and surprises of the six-cylinder engine surely have brought the enthusiastic and exacting automobilist more than ever to the realization of his dream.

Unless an extraordinary revolution in gas engine design takes place, the six-cylinder engine will continue to represent the best in motoring, as it means smoothness, silence and ease of operation to a degree unknown in any four-cylinder car.

FOR PRESERVING THE HORN BULB.

A stitch in time certainly saves nine with the rubber bulb of the average horn, says the *Autocar*. Most of them have a raised ring in the middle of the bulb just where the thumb of the driver comes, and very soon at this spot the rubber gives way. As we have pointed out before, the bulb can be mended quite well with a solutioned patch, but this is apt to give way from time to time. The best method is to deal with the bulb before it commences to leak. The first thing to do is to fill up the space inside the raised ring with a solutioned disc of rubber. Then solution another ring of rubber round the raised ring, about half an inch wide, and on top of this place still another piece of rubber. If this work is carefully done, it results in the part of the bulb which is most subjected to wear being greatly strengthened, and they will last for a couple of years without renewal. The operation may be simplified by paring the ridge away with a sharp knife, until flush with the bulb, then placing a large patch right over the top of the entire bulb. There is no better material for the purpose than an old inner tube.

Skyward in a Northern

A Five to Twelve Per Cent. Grade Marked the Way Up Mt. Hamilton.

JUST twenty-seven miles east of the beautiful city of San José, in the sunny land of California, old Mt. Hamilton rises up in solitary splendor a sheer 4,409 feet above the sea level. Capping it, much like a monk's tiny skull cap, is the famous Lick Observatory, known the world over for its great telescope, its remarkable photographic apparatus and appliances for making pictures of the heavens and their celestial bodies, and for its marvelous instruments for recording the time and velocity of the wind, atmospheric conditions and seismic disturbances.

Thousands visit the Lick Observatory yearly and pay tribute to Mt. Hamilton in enthusiastic expressions, marveling at its grandeur. Few, however, have experienced the sensation of flying up its dizzy heights as did John D. Swan in his Northern touring car, February 22, of the present year. But Mr. Swan's story is best told in his own words:

"Leaving San José, decked in gorgeous flowers, as it always is at this period of the year, a light breeze fanning the slender giant palms that line each side of the road we headed our Northern across the level roads, four miles to the foot hills, where the first grade was reached. The road was as smooth as a city pavement. As far as the eye could see, fruit, orchards in bloom dotted the rolling hills, while here and there a little brook sparkled in the morning sunlight. The whole scene was enchanting. To fly swiftly along, up and down grades, across miniature bridges and around curves, much as if the car was being drawn by some distant star or pushed over the hills by an unseen hand, provokes sensations wonderfully exhilarating and joyous—feelings that can hardly be expressed in words, but which every autoist who takes such a trip can well understand.

"The last stage-station was reached before we knew it. Thirteen miles away and four thousand feet above us the great Observatory shone, looking for all the world like a lilliputian monument. From this station our quiet car glided down a slope to the valley below, little thinking that immediately on the other side the real climb commenced, and

that, from there on, the smoothly running motor under the hood must push the car and its passengers up and above the clouds.

"The road led on round and round the mountain, the grade meter on the dash indicating at times a grade ascent of 12 per cent. Never did it drop below five or six, although the high-speed clutch of the car was in, practically sealed, because from the time the car left San José it had not been pulled out of position. Not an inch of the road was level not a yard straight; the road wound in and out around rocks, skirting precipices and cañons, for all the world like a giant serpent with its fanged head in the skies and its tail in the valley below.

"About half way up the mountain we felt the first effects of the perennial snow, the road on the north side being very slippery, and on the second winding the snow made its presence felt in earnest. Not only was it much colder, but huge drifts appeared on either side of the twisting road. The snow is always particularly bad on the mountains of California in February. The road is kept open by shovelers, and the Northern never wavered in its progress up the winding way to the final spurt up the 12 per cent. grade to the mountain crest. The road in this particular spot is covered with broken stone, made slippery by the constant moisture, and we learned from the keepers of the Observatory that this had proven the 'last straw' for many an auto which had striven gallantly to reach the dizzy height which the Observatory occupies.

"Our car glided swiftly up to the very door of the Observatory, and for the first time I pulled out the clutch and brought the car to a stop. The kindly guide at the Observatory looked over the Northern in amazement, and informed me that on only one or two previous occasions had a car been driven to the door of the Observatory, and that the record time was held by a racing machine which had dashed up the mountain in the heat of summer over dry roads in 1 hour 17 minutes. The 24-horsepower Northern had not been driven against time, but when watches were referred to it was found

At the Mountain's Top in Front of Lick Observatory.

Northern Car in Mt. Hamilton's Perennial Snow.

that the long non-stop run had been made in just 1 hour 50 minutes from San José, and this at a constant speed without changing gears or a single stop. Mrs. Swan accompanied me on the trip and was much impressed with the beauty of the scenery and the glorious possibilities of exploration which the automobile offers.

"The old bewhiskered stage driver who approached our car, clambered down from his heavy stage, announcing his guests to the guide, and came over to look at his apparent competitor standing before the Observatory door. After I had assured this quaint character that I did not intend to compete with him in his passenger service and answered his many questions, I asked him why he did not drive four or six horses, instead of two. The driver looked at me as if contemplating whether or not I was joking with him, and, seemingly convinced that I was in earnest, answered: 'Wal, you see. It's like this. In the first place, four horses would cost twice as much as two. Then they'd stow away twice as much feed and take twice as much looking after, and what's the use of having four when I can do the work with two?' Going down the mountain, after we inspected the Observatory carefully, we had an opportunity to test the efficiency of the brakes."

A CLUB RUN IN CALIFORNIA.

SAN FRANCISCO, April 1.—The first scheduled event of the season under the Automobile Dealers' Association of California took place last Sunday, and lay from this city to the summit of Mt. Hamilton and return. Most of the cars left on the 7 o'clock boat, but all day they left the city for a run to the blossom district. The run was made down the Oakland side to San José, out Santa Clara avenue to the Alum Rock road, from which on the right branches the Mt. Hamilton road. There was no contest of endurance or speed in connection with the event, which was purely one of a social nature. The distance from San José to the summit is twenty-eight miles, the last seven being characteristic of the entire route, having, in the course of the seven miles, 365 turns. It is a most picturesque trip, over excellent roads. The hills and valley were carpeted with bright green grass, splashed here with the flaming orange of the California poppy, and there with the yellow of the buttercup, while in shadier places were masses of purple and pink. At the foot of the hills and along their bases nestled the symmetrically laid-out ranches and orchards, with their carefully kept-up fields and outhouses. In the far distance could be seen the sparkle of the waters of the Pacific. The day was exceedingly clear, with a bright, warm sun and just enough breeze to carry the scent of the blossoms, hundreds of acres of which looked like blocks of snow. More than fifty automobiles made the run, and, on an average of four persons to a car, fully two hundred persons visited the Lick Observatory, which crowns the summit of the mountain. The run back to San Francisco, from San José, was made on the coast side, over the new boulevard being constructed through the untiring efforts and supervision of R. P. Schwerin.

INTERESTING TEST OF NEW FRICTION CLUTCH.

After a year's experimenting and study of the problem, Forrest R. Jones has brought out a new friction clutch, which has been termed the "Atorqlim." In a recent shop test to determine uniformity of torque limitation, rapidity of picking up full load and releasing it completely, and the effect of heating on the bearings and other parts of the clutch, the driving member rotated at 450 r. p. m., the "driven" side being held so as to prevent its rotation. The turning force transmitted to the driven side was weighed on a pair of scales, as when using a Prony brake. The adjustment of the clutch was for 105 foot-pounds torque, corresponding to 20 horsepower at 1,000 r. p. m.

During most of the time the clutch was mechanically let into engagement and released, as by a foot lever, at the rate of 170 times a minute. The duration of each full frictional engagement was half the total time between successive releases. Several times during the test, and at the end, the mechanical releasing device was thrown off, and the clutch left in continuous full frictional engagement for five to ten seconds, sometimes fifteen seconds and longer. After running half an hour in this manner, the clutch became so hot that black smoke began to puff out at every release and ordinary machinery oil vaporized rapidly from the outside. This continued till the end of the test, which covered something more than an hour.

The torque limit, as indicated by the weighing scales, did not vary beyond 25 per cent. in the tests where the clutch was left in full engagement for several seconds continuously. When released 170 times a minute, the variation was within 5 per cent., as shown by keeping the scales adjusted so that the beam was lifted each time but did not strike at the top. No adjustment of the clutch was made during the test. At each release the lever arm resting on the scales could be lifted by a slight pressure of one's little finger. An attempt to weigh the drag when the clutch was released was unsuccessful on account of its being so small, except that it was plain that it was within a foot-pound. No indication of wear or injury to any part on account of this test was found when the clutch was taken apart after the test. The originally bright parts enclosed by the friction rings had become thoroughly blued and blackened by the heat. Black smoke continued to come off for more than a quarter of an hour after the opening. The clutch was still in perfect working order.

In earlier trials the friction rings were left annealed very soft in order to see the effect of their cutting and abrasion, and of the resulting chips of metal, on the action of the clutch. It took care of them satisfactorily. More than half a pound of these chips was removed from the clutch just before beginning the test described. The friction rings were, of course, roughened in

Details of the New Atorqlim Friction Clutch.

the earlier tests, but the internal bearings were not affected at any time, since they are made to withstand temperatures far above that which blues steel. The maximum to which the torque is limited is reduced by pressure on the releasing lever; the clutch can therefore be operated the same as any other type, for more gradual starting than complete engagement gives, and still retains its advantage over the usual types in that the torque is prevented from exceeding the limit determined by the pressure of the foot. The accompanying illustration shows a side elevation of the complete clutch, while at the right is a plan view, the third sketch showing one of its components.

HOW FARMAN AND DELAGRANGE MADE RECORD FLIGHTS

PARIS, March 25.—One mile 428 yards 32 inches is the world's official flying record, established by Henry Farman, in his Voisin Frères aeroplane at Issy-les-Moulineaux, Saturday, March 21. In reality, the distance is over two miles, for, during the 3 minutes 31 seconds that Farman remained aloft, he made two complete circles round the two flagstaves planted in the military ground at a distance of 547 yards 8 inches, one from the other. Four times the distance from flag to flag gives the official record; but, as it is impossible for a mechanical bird measuring more than 33 feet from head to tail to swing round as easily as a taxicab, considerable allowance must be made for the turning curves, the preliminary flight, and the final sprint prior to coming to earth.

When the officials of the Aero Club of France planted the two flags at the extremities of the measured track, the monotonous plain on the banks of the Seine was so enshrouded in fog that it was almost impossible to distinguish both flags at once. Farman was ready first, and, after a little preliminary cantering, started from the outermost edge of the ground for one of the flagstaves, rounded it with but three or four feet to spare, and rushed toward the opposite one. In a few seconds another

Distance Covered by Farman In World's Record Flight.

huge circle had been described around the two fluttering flags; but when the official starting point had been crossed for the second time Farman still continued, flying wider afield, and coming to earth gradually at the outside of the ground.

So far as could be judged, only the limitations of the motor prevented a much longer aerial flight. Since winning the Deutsch-Archdeacon prize, Farman's aeroplane has been dismantled and reconstructed on identical lines, with rubbered cloth, manufactured by the Continental Tire Company, this material replacing the former varnished silk covering. The new Renault air-cooled eight-cylinder motor was also fitted, but when experiments were made, was found to need some tuning up, and was dismantled and sent to the factory. It was, therefore, the original eight-cylinder water-cooled Antionette which drove the aeroplane in its world-record flight. Though running without a skip from beginning to end, the Antionette has the serious disadvantage of possessing a very small quantity of water in its jackets and tanks, and to be limited by reason of weight in the amount of gasoline it can carry. Thus a flight of any length is almost an impossibility unless more fuel is carried.

"Climb in and Fly with Me," said Delagrange.

Leon Delagrange entered the arena at noon, when a little of the excitement attending Farman's victory had subsided. A little preliminary cantering over the ground to the healthy roar

of the eight-cylinder motor, then the signal for an official flight, and 2 minutes 30 seconds later a circle of 1,640 yards had been described. Had Delagrange started first his performance would have been a record, for the previous long-distance flight was one kilometer, covered by Farman on January 13.

Farman had remained an interested spectator of the flight of his friend and rival, and was but a few yards from the aeroplane when it came down. "Climb in, Farman, and I will take you back to the sheds," cried Delagrange. In a second Farman was mounted behind Delagrange for the trip to the sheds.

Michelin Increases Aero Prizes to \$52,000.

In consequence of Farman's new record, the committee of the Aero Club of France fixed the distance to be covered this year to win the Michelin prize at 12.4 miles. During 1908 the prize may be competed for after April 10, and for the succeeding seven years the dates, distances and conditions will be determined by the French Club. M. Andre Michelin announced that he would increase the total amount offered for these competitions from \$50,000 to \$52,000. For eight successive years the sum of \$4,000 and an artistic cup valued at \$2,000 will be given for the longest flight in France or any country having an aero club affiliated with the French organization. Originally, it was intended to make the first year's distance double that of Farman's record in January, 1908, doubling the distance each year.

For the \$20,000 Michelin prize, an aeroplane with two persons on board must start from any point in the Seine or Seine and Oise department, encircle the Arc de Triomphe at Paris, fly to Clermont-Ferrand, encircle the Cathedral of that city, and descend on the summit of the Puy-de-Dome. The distance from Paris to the Puy-de-Dome is about 220 miles, and must be covered in a time limit of six hours. The Puy-de-Dome being 5,800 feet above the level of the sea, an aeroplane would have special difficulty in making a flight to such a height, owing to the rarification of the air, which, it is calculated, would decrease the sustaining power of the machine by at least one-sixth. Resistance would necessarily be less, the machine operating in a fluid of lesser density. Ten years are allowed for the accomplishment of this long-distance flight.

Details of Farman's Nearly Serious Accident.

PARIS, March 28.—Henry Farman's aeroplane, the modified machine with which the flyer won the Deutsch-Archdeacon prize, is no more. Farman was training on the Issy-les-Moulineaux ground Friday morning, in the presence of a small number of spectators, when, on making a turn, the left wing of the aeroplane came in contact with the ground while traveling 30 miles an hour. It collapsed under the blow, throwing the pilot violently from his seat. Farman lost consciousness, and is only able to give a meager account of what happened. It is his opinion, however, that he attempted to turn too near the ground, at a height of 2 to 2 1/2 yards, the inclination of the machine causing the lower part of the left wing to touch. It is also extremely probable that, at the moment of turning, the machine was driven still nearer the ground by a gust of wind.

Louis Bleriot, who had been timing Farman's attempt, rushed to the spot immediately. Farman was lying face downward, his chief injuries being to the face and mouth. Upon being carried into one of the temporary sheds, he regained consciousness, and was taken home in an automobile. Fortunately, no part of the aeroplane, or its motor, fell upon him, and it is to this fact that he owes his life. The aeroplane was completely destroyed, but the Antionette motor is intact. Farman will probably be out again within a week.

To the South Pole by Auto Sleigh.

Automobile sleighs have come to the fore in such numbers for the purpose of Polar exploration that a meeting was recently

Dr. Charcot's Auto Sleigh for Polar Exploration.

held on the Col de Lauteret, in Dauphine, to try them out. One of the explorers present was Dr. Charcot, who will head an Antarctic expedition, sailing on the *Pourquoi-Pas*, August 1 next. The type of sleigh he will use is shown by the accompanying photograph. It consists of three distinct parts, comprising the sleigh proper, which is of Norwegian build; the power plant, placed at the rear, and entirely protected from the snow; and the propelling wheel. The motor is rated at 23-4 horsepower, and the transmission provides two forward speeds, enabling the sleigh to travel at four kilometers an hour on the low, and eight on the high. The propeller consists of a wheel with two rims placed 28 centimeters apart and mounted on the same felloe, each being provided with grips designed to take hold of the ice.

On Their Mettle—From "The Car" (Eng.).

P. C. Trappe (aeroplaintively): "Flings is fair rotten! 'Ere I've been 'idin' in a cloud for three hours an' ain't nabbed one of 'em!"
P. C. Spotte (ditto): "Nor me, nether. Strikes me every balloonatic knows the clouds 'as got a 'copper' linnin' nowadays!"

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- Apr. 4-11.....—Pittsburgh, Pa., Duquesne Garden, Annual Show, Automobile Clubs of Pittsburgh. Thomas I. Cochran, manager.
Apr. 16-18.....—Memphis, Tenn., Automobile Show, Memphis Automobile Dealers' Association. William Bruce, secretary.
Apr. 21-23.....—Louisville, Ky., New Coliseum, Automobile Show. Hubert Levy, manager.
June 25-27.....—Detroit, Thrd Annual Summer Meeting of Society of Automobile Engineers.

Race Meets, Hill Climbs, Etc.

- Apr. 11.....—Philadelphia, Roadability Contest to Cape May, Quaker City Motor Club.
Apr. 24.....—Briarcliff Trophy Race, Westchester County, N. Y. Robert L. Morrell, chairman.
May 4-5.....—Harrisburg-Philadelphia and Return, 300-mile Endurance Run, Motor Club of Harrisburg.
May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
May 16.....—Hartford, Conn., 200-mile Endurance Run, Automobile Club of Hartford.
May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
May 30.....—San Francisco, Endurance Run under the auspices of the Automobile Dealers' Association.
June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
July 6-8.....—Buffalo, National Convention of the A. A. A. and Start of Fifth Annual A. A. A. Tour.
Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, under the auspices of the Automobile Dealers' Association of San Francisco.
Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- May 17-31.....—Austria, Budapest Automobile Show.
May 17-June 2.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- April 1-13.....—Monaco Motor Boat Races and Motor Boat Exhibition, International Sporting Club of Monaco.
April 25-May 25.....—Industrial Vehicle Competition, Automobile Club of France.
May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
May 7.....—Sicily, Palermo, Targa Florio Circuit, Voiturette Race, Automobile Club of Italy.
May 11-16.....—Ireland, Irish Reliability Trials.
May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
May 31.....—Russia, St. Petersburg to Moscow Race.
June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
June 14.....—Mount Cenis Hill Climb, for Voiturettes.
June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club of Germany.
June 15-19.....—Scotland, Scottish Reliability Trials.
July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France).
July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
July 20-30.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusten Automobile Club.
Sept. 1-8.....—French Voiturette Contest, auspices of "L'Auto."
Sept. 6.....—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.
Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

EDGE, PUBLICITY-GETTER PAR EXCELLENCE.

England possesses a publicity expert who stands head and shoulders above the leaders in what is generally supposed to be an American profession, and the land of the Union Jack is in ignorance of the fact. It is because S. F. Edge can always keep himself and the six-cylinder interests he has at heart fully in the limelight without any apparent show of commercialism that he has been accepted in a land where "big drum" methods are usually frowned upon, as the outstanding figure of British motoring. Edge is the winner of the Gordon-Bennett cup—way back in the early days of the century; he is the holder of the world's twenty-four hour record; he is the eternal winner on Brooklands track. But Edge as a publicity man, such a connection never occurs to the Englishman. The crowning point of Edge genius is that whether he wins or loses in a contest, starts in a race or remains quietly at home, he is always, by a happy turn of circumstances, more prominently in the public eye than the man who wins or struggles to win the laurel wreath. Edge has already secured more prominence

S. F. Edge.

and enrolled more fervents for his cars in connection with the French Grand Prix than will the lucky mortal who passes the winning post and is carried up to be presented to some French potentate on the Dieppe course next July. Commanding those happy turns of circumstance is genius. There are plenty of drivers who are not afraid to match their skill against that of Edge; there are many who, like him, have graduated from a bicycle to a racing car; there are just as many who have reached the top rounds of commercialism, but there is no other man who can combine with such qualities an ability to keep the world's tongue continually wagging about Edge. A publicity expert has to retire after his third coup, declared an authority. It is false, and S. F. Edge, ex-cyclist, racing automobilist, business manager and letter writer is daily proving it so.

WHITE STEAMER GETS WILKES-BARRE PRIZE.

WILKES-BARRE, PA., April 6.—By the forwarding of a gold medal to the White Company, Cleveland, O., a settlement of the dispute between the latter and the Wilkes-Barre Automobile Club, which has existed since the running of the Giants' Despair hill-climb on Decoration Day last year, has been reached. The medal in question was the first prize in the free-for-all event, which was won by Walter White in a steamer. At the same time an offer for settlement of the dispute over the prize for another open event was sent to Mr. Harper, of Philadelphia, and it is expected to be accepted. When this is done, the American Automobile Association will sanction the third annual hill-climbing contest, which is to be held on Giants' Despair on May 30 next. After the contest last year, the Wilkes-Barre club refused to award the prizes to the drivers of the steamers, and a protest by the latter was sustained by the A. A. A.

LOUISVILLE TO HAVE AN AUTO SHOW.

LOUISVILLE, KY., April 6.—Through the efforts of Hubert Levy, of the Kentucky Automobile Company, Louisville is to have an automobile show, which will be held in the Coliseum on April 21, 22 and 23. It will be managed by Mr. Levy, and a large number of representative cars will be staged.

Designer E. J. Moon in 1908 Limousine Moon Car.

STEARNS WINS ATLANTA CLIMB'S OPEN.

ATLANTA, GA., April 4.—Atlanta's second annual hill-climb, held recently on the Stewart avenue hill, was decidedly a success, despite a protest over the timing in the free-for-all event and a smash-up at the foot of the hill, when a car ran amuck.

Ed. Inman's 1907 Stearns, which won the free-for-all event last year, and set a record for the hill of 1:06, again captured the free-for-all, covering the slightly longer course in :51 1-4. This time was protested by John F. Kiser, who was second, with his Thomas, in :54. He claimed that the timers at the bottom of the hill caught the Inman car in 1:01. Here are the winners:

CLASS 1, RUNABOUTS COSTING \$1,000 OR LESS.

- 1. Buick..... 18William Oldknow..... 1:20 1-5
- 2. Ford..... 15M. C. Hule..... 1:28
- 3. Ford..... 15J. H. Bryant.....

CLASS 2, TOURING CARS OR RUNABOUTS COSTING \$2,000 OR LESS.

- 1. Reo..... 20Joe Landers..... 1:29 3-5
- 2. Cadillac..... 20C. E. Travis..... 1:29 4-5
- 3. Ford..... 15J. H. Bryant..... 1:23 3-5

CLASS 3, TOURING CARS COSTING \$3,000 OR LESS.

- 1. Pope-Hartford..... 25-30J. P. Grady..... 1:06 1-5
- 2. Oldsmobile..... 35-40H. J. Lamar, Jr..... 1:11 3-5
- 3. Stoddard-Dayton..... 30L. E. Fain..... 1:13 2-5

CLASS 4, TOURING CARS COSTING \$4,500 OR LESS.

- 1. Thomas Flyer..... 60C. C. Rooney..... 1:07 2-5

- 3. Pope-Hartford..... 25J. P. Grady..... :59 4-5

Driver Almand in Stearns Winner of Atlanta Hill Climb.

WHAT ONE CLUB IS DOING FOR GOOD ROADS

PHILADELPHIA, April 6.—The committee on roads, maps and signs of the Automobile Club of Philadelphia, with Powell Evans as chairman and W. O. Griffiths and C. S. Wurtz, Jr., as associates, has prepared a local road book of Philadelphia and vicinity for the use of its members. The club is giving a good deal of attention to the matter of good roads, and is also erecting signboards on all the important routes in the vicinity of Philadelphia.

Explaining its interest in the matter of good roads, the club's committee includes the following material in its little volume:

"The widespread interest and activity in good roads which has of late shown such general strength throughout the country has its origin largely in the growth of automobilism.

"The principal cause of the great European road system was military necessity—the provision of proper highways in surface, line, and grade to admit of speedy passage of troops and armament throughout the year. Highroads so constructed primarily by the State were preserved and maintained in more peaceful times for the different phases of their economic value. Hence

good roads. The excellence of the road system of any country largely measures the progress and intelligence of its people.

"Second.—Roads should be constructed and maintained by the community (State, county, or local authority, as the law requires). Main highways between centers should be constructed by the State or National government; crossroads by the local authorities; toll roads should be abolished.

"Third.—Roads should be constructed and maintained under a uniform and modern road law providing a common tax on property and its collection. Road work should be prosecuted by the designated authorities, without option to taxpayers of 'working out' the road tax—whereby citizens under inspection of local officials may neglect or evade their obligations by use of their influence as voters.

"Fourth.—Roads should be free to all travelers of the community alike under just and equal common conditions and limitations as defined by law. For example: Speed should be regulated by conditions of time and place, so that driving is not to be the common danger, without arbitrary limits and referable to the control possible for each vehicle. Lights should be carried during the night by all vehicles alike.

"Fifth.—Roads should be maintained by the community for use of all the people alike, with reasonable wear expected and allowed to admit of proper vehicle control. For example: Reasonable anti-

In France Roads Are Built and Kept in Repair and also Properly Marked by Comprehensive Signboards.

there has come down to modern days in many old countries complete road systems and experience practically unknown in this country. The United States was too large, new, and isolated to need or provide like highways prior to the advent of the railroad for transportation, and with this great want filled during the last half century, our road systems have been left to the mercy of careless and fortuitous development and maintenance. The reluctant restriction in traversible radius at any reasonable speed with any sort of load, together with the increase of cost from loss of time and maintenance of conveyance, is only beginning to be understood throughout the country.

"The advent and tremendous increase in the swift and comfortable motor car has enticed an ever-growing number of people into spending their leisure along the highways here and abroad. The contrast has been a revelation, and the sentiment of a few is growing into the action of a host who demand that this rich and beautiful country shall no longer lag behind others of like civilization and less wealth in the provision and maintenance of a highway system second to none anywhere.

"One of the moving reasons for the issuance of this pamphlet at this time by the Automobile Club of Philadelphia is to place before its members and friends the consideration of *principle* and *detail*, which are thought of value in advancing the cause of good roads in this part of the country where our interest centers, and where rapid progress can be made. We hold that:

"First.—Civilized communities should construct and maintain

skid tires in winter are as permissible for motor cars as calks in horses' shoes, even if road wear is increased, because such tires are as essential for driving to the common security as roughened shoes on horses. Both are certainly more injurious to roads than tyres for summer use. All or none of the traffic should be taxed.

"Sixth.—Every violation of road law should be notified by proper road signs placed by the authorities as precedent to a possible legal violation. For example: Many minor crossroads are so unapparent to the average traveler (especially a stranger) passing within legal speed as not to be recognized as such for the purpose of blowing a signal. The local authorities charged with the highways know these roads, if any do, and they should be required to erect warning signs at such crossings, giving plain notice to the traveler that a signal is to be blown there, before an arrest and fine for failure so to do is permissible.

"The Automobile Club of Philadelphia hereby announces and favors the above principles. It also counsels its members to fully learn and obey the road use laws, and to comply fully and carefully with all the rights and courtesies of the highway.

"The Automobile Club of Philadelphia, in advancing the work of good roads through the territory naturally falling under its activity, delegated to a Committee on Roads, Maps, and Signs, the work of surveying the highways for the preparation of maps and the location of signboards. This committee found few and inferior maps only partially covering the section, imperfect and unconnected road systems, and few and unreliable signs placed at random. It has for the greater part of a year given as much time as its members could devote to the subject without conflict with their other engagements."

APRIL DAYS AMONG THE AUTO CLUBS

PENNSYLVANIA CLUBS HAVE FULL SCHEDULE.

PHILADELPHIA, April 6.—Local automobilists are conditioning their cars for a severe campaign, which opens next Saturday with the Quaker City Motor Club's roadability run to Cape May, to be followed by the Norristown-Lancaster-Reading endurance run of the Norristown Automobile Club, April 28, the Harrisburg-Philadelphia-Harrisburg endurance run of the Harrisburg Motor Club, May 4-5, and the Wilkes-Barre hill-climb, May 30. These, with the York Automobile Club's endurance run, with another Quaker City Motor Club run to Wildwood, and at least one race meet at Point Breeze, will offer more than sufficient motor pabulum for even the most exacting.

Next Saturday's event for the Hotel Cape May cup already boasts 22 entries, with several more days to hear from. The start will be made after midday, with the finish less than five hours later, the 92 miles of fairly good roads offering no obstacle to the average car unless the weather be decidedly wet.

The Wilkes-Barre hill-climb is becoming as much of an annual fixture for the Quakers as for the Diamond City enthusiasts. Coming on Memorial Day, which falls on Saturday, there will be a week's end hegira of local automobilists to the Luzerne capital to take a hack at the plunder which the Wilkes-Barreans usually hang up to attract them. Arrangements are already afoot for a three-day run to and from the "American blue ribbon hill-climb," and probably the Quaker City Motor Club will call a run, as was done last year.

NEW PRESIDENT FOR ROCHESTER CLUB.

ROCHESTER, April 6.—In the annual meeting and election of officers of the Rochester Automobile Club, President Harry S. Woodworth retired in favor of Harry G. Strong, and in a farewell speech congratulated the members on the progress made during the year. The new officers are: President, H. G. Strong; vice-president, William C. Barry; secretary, Bert Van Tuyle; treasurer, Rudolph Schmidt. The new board of governors includes James E. Gleason, W. W. Hibbard, John E. Morey, F. E. Mason, Richard T. Ford, George E. Gordon, John S. Bingeman, A. F. Crittenden and Harry S. Woodworth. Until this election Mr. Van Tuyle has filled the office of treasurer and secretary.

In presenting his annual report Secretary Van Tuyle said that the past year showed a net gain of 75 members. At the last annual meeting the number of members in good standing was 335 and the club now musters 410. The stealing of cars has also been stopped, thanks to the action of the club and the co-operation of the police. This year it is proposed to have an additional safeguard in the shape of a filing system, whereby the club office will always have at hand a complete description of the cars owned by members.

The annual banquet of the club will be held Monday, April 13, at the Genesee Valley Club.

AUGUSTA, GA., CLUBMEN MEAN BUSINESS.

AUGUSTA, GA., April 6.—At a meeting of representative owners, held last Tuesday night at the Chamber of Commerce, steps were taken to thoroughly reorganize the Automobile Association of Augusta to insure great activity in the future. New officers were chosen as follows: President, C. B. Garrett; first vice-president, F. B. Pope; second vice-president, J. H. Davidson; secretary, Dr. Eugene Murphy; treasurer, C. D. Carr.

The club has aims other than mere social intercourse. Plans were discussed for the enrollment of the 110 owners of cars in the city, and for the adoption of speed and other regulations for the mutual protection of the members and the general public. The club will become a member of the Georgia State Automobile Association of the A. A. A., which shortly will be organized.

DEAD HORSE HILL CLIMB PROBABLY JUNE 6.

WORCESTER, MASS., April 6.—The governors of the Worcester Automobile Club lost no time in calling a special meeting of the board in the clubrooms, upon receipt of word that the bill introduced by a club member and fathered for two years by the club, allowing the mayor and the board of aldermen of cities and the selectmen of towns in Massachusetts to issue permits to hold automobile hill-climbing contests, had passed the legislature. As a result of the meeting, it is announced that the famous Dead Horse Hill contest would be revived probably June 6. This committee was appointed to confer with the mayor and board of aldermen of Worcester and the selectmen of the town of Leicester in regard to the date: John S. Harrington, George Stowe, J. P. Coghlin, D. F. Gay, and F. E. Frost. Both bodies will have to be seen, as the Dead Horse hill course lies partly in Leicester and partly in Worcester.

The passage of the bill is a great victory for the Worcester club, and entailed no little work, in view of the fact that it legalizes speed contests on the fine State highways of Massachusetts, and during the holding of such contests bars the general public off the course, unless it sees fit to pay the admission price charged by the management of such a contest. The committee further announced that it had decided to bar from competition in the mile-long climb all specially constructed speed cars and freak cars. The climb this year—and, probably, in years to come—will be a competition for stock cars only.

DETROIT CLUB HAS OUTGROWN ITS HOME.

DETROIT, MICH., April 6.—The first warm days of Spring have brought the motorists out in full force, and many runs have already been made to the home of the Automobile Club of Detroit, at Pine Lake, twenty miles distant from the city. The clubhouse will not be opened for the season for some time yet, although plans are being perfected for the housewarming, which will mark the official advent of another season.

The only thing worrying the members now is the question of accommodations. Last year the commodious clubhouse had its capacity tested almost daily, and since that time the membership of the club has increased materially. When the home at Pine Lake was secured it was thought that all future trouble in the way of accommodations had been disposed of, but so firm a hold has motoring taken on Detroiters, and so popular is the club, that at the present rate it will soon be necessary to limit the membership or seek larger quarters.

PEORIANS DINE AND PLAN FOR TOURS.

PEORIA, ILL., April 6.—The Glide Automobile Club, of Peoria, which is an outgrowth of the old Peoria Automobile Club, held its first annual banquet at the Creve Coeur Club last Monday evening. There were some forty members present and guests from out of the city. A most enthusiastic time was had and a number of plans were outlined for runs and tours during the coming season. The club is collecting information regarding routes and road maps covering Illinois territory.

CHICAGOANS GO THROUGH "WILDEST CUBA."

CHICAGO, April 7.—Members and guests of the Chicago Automobile Club had a rare treat to-night in an illustrated lecture, "Through Wildest Cuba," setting forth the adventures encountered last winter by S. D. Walden, Ralph Estep and other Detroiters of Packard proclivities in a tour through the island. The lantern slides were all from negatives made by a member of the party that made the trip, and showed, in a striking manner, some of the difficulties met with in touring the island.

RAPID GROWTH OF AUTOMOBILING IN SOUTH

BY F. S. SLY, TRAVELING CORRESPONDENT OF THE AUTOMOBILE.

CHARLESTON, S. C., March 26.—Owing to its location, this city is a good field for both automobiling and motor boating, and some of the dealers handle both marine motors and automobiles, though the latter is their chief standby. There are now about 125 cars in use here and, as some of the autoists are enthusiastic, there has been some talk of organizing a club in the near future, but as yet nothing definite has been done.

C. V. Boykin, a resident inventor, has perfected a very simple little device to enable the driver to always start the motor from the seat on the spark. He has had it in constant use on a Mitchell four-cylinder car here since last July and it has proved very satisfactory in service. Patents were applied for some time ago and will be issued shortly. The inventor does not expect to manufacture the device but is desirous of selling the right to make it on royalty.

The prospects for selling a number of low-priced cars here are excellent. Roads in this part of the State are sandy, in contrast with the heavy clay soil to be found a little further north, and light, low-powered cars seem to fare much better on these sand roads than do much more powerful cars, owing to their weight. The cars represented here are the Premier, Reo, Rapid, and Manhattan, handled by the Charleston Motor Company; the Cadillac and Buick, represented by the Army Cycle Manufacturing Company; and the Ford, Maxwell and Mitchell, which are sold by the Automobile & Marine Motor Company. These three firms all maintain good-sized garages and repair shops, beside which there is the Automobile Repair Company.

Atlanta Claims Greatest Number of Autos in South.

ATLANTA, Ga., March 28.—This city is really the greatest automobiling center of the South, as it can boast of between 500 and 600 machines—a number equivalent to those owned in a great many other Southern cities put together. A club was formed about a year ago, but through lack of initiative on the part of its organizers interest in the movement was allowed to lapse and no meetings have been held. The project has recently been taken hold of anew and a reorganization of the existing club is now assured. Much interest is manifested in the annual hill-climb, which is to take place to-day. The course is about a mile long, and the start is made from what is practically a standstill, only 100 feet being allowed for the driver to get into high-gear before crossing the line.

The roads around Atlanta are fairly good in dry weather, though most of the cars in use here do not go far outside the city at any time, driving being confined to comparatively short runs. This city's importance as a Southern center of automobiling is reflected in the number of agencies and garages there are here, as well as their prosperous condition. The Packard and Pope-Hartford are represented by F. C. Steinhauer, while the Peerless and Buick are handled by H. C. Nesbit, and the Ford interests are taken care of by the Ford Auto Agency, in Houston street, which maintains a special garage for Ford cars. The Field Auto Company, and the Southern Auto & Equipment Company, the Columbia garage, and F. C. Steinhauer are the principal depots that take care of and repair cars.

Montgomery Believes in the Building of Good Roads.

MONTGOMERY, ALA., April 1.—The roads about Montgomery are an exception to the usual run of those found in the South, and that much of this is doubtless due to the influence of the automobile is evident from the fact that the county commissioners have recently been prevailed upon to appropriate an additional \$250,000 for the purpose of extending the improvements to the county line on the roads radiating from the city in each direction. This will make Chatham county one of the best equipped of its kind in the South. The Montgomery Auto-

mobile Club has been responsible, in a measure, for the good work thus accomplished.

The Cadillac, Pope-Toledo and Columbia are handled by the Montgomery Automobile Company, which maintains a good garage, as does also the Mosler-Hagler Electric Company, representing the Thomas and Babcock electric; the Capitol City Garage handles the Franklin, Buick and Pope-Waverley, while the Mitchell and Oldsmobile are represented by the Patterson-Ingalls Motor Car Company.

Jacksonville for Autoing Despite Scarcity of Roads.

JACKSONVILLE, FLA., April 3.—Considering that Florida is generally reputed to have less available road mileage than almost any one of the Atlantic Coast States, the fact that Jacksonville can boast of no less than 375 cars, affords excellent proof of the manner in which interest in automobiling grows, even under adverse conditions. There is an automobile club here, of which Charles Clark is president, and Herbert Race, secretary, but interest in its affairs has been permitted to lag somewhat. The city streets make excellent driving, but immediately outside there is nothing but loose, shifting sand. In addition to this, practically all of the wagons have the wide tread prevalent throughout the South. This is 60 inches, so that the traveling is made even worse for the 56-inch automobile. Cognizance is now being taken of the fact that the five-foot tread is standard down here, and the Ford Company make their light cars conform to this, when so ordered.

A number of cars are represented here, the Premier and Rambler being handled by R. W. Atkinson; the Cadillac and Buick, by Hutto & Co.; the Reo, Stoddard-Dayton, Atlas and Maxwell, by T. E. Gilbert, and the Ford, by L. C. Oliver, each one of these concerns maintaining a well-equipped garage.

Birmingham Has About 150 Automobiles.

BIRMINGHAM, ALA., April 6.—There are about 150 automobiles owned in this city, which possesses excellent streets, and the roads in the country are fairly good. Preparations are quite advanced for the betterment of country roads, and it is safe to state that in the near future there will be many miles of first-class highways in this vicinity. As one investigates the South, he is constantly surprised by the widespread growing interest in the matter of roads, and, furthermore, roads are actually being constructed.

The automobile trade is quite well represented in Birmingham. The Automobile Exchange handles the National and Ford, also Baker electrics. C. C. Nixon sells Locomobile and Cadillac, and also conducts a garage. The Southern Garage handles Franklin and Brush cars, and the Birmingham Garage looks after Maxwell, Reo and Stoddard-Dayton.

James J. O'Rourke is about to open a new garage, 50 by 90 feet, two stories high, and will represent the White steamer.

Birmingham has a club whose activities have been somewhat apathetic. Its officers are: President, R. S. Munger; vice-president, J. E. Deadman; secretary-treasurer, Charles Denagre.

An Automobile Course from Chattanooga to Knoxville.

CHATTANOOGA, TENN., April 6.—According to the Chattanooga News, there is a movement on foot to establish an automobile course from Chattanooga to Knoxville. The plans provide for building a 75-foot automobile drive through the Mission Ridge tunnel, and then to Cleveland, and later to Knoxville. When built, it will be used exclusively by autoists, and no horse-drawn vehicles will be allowed on it. According to the News: "The first cost in the building of such a course would be about all the expense there would be attached to its building, because there would be very little wear and tear on such a drive if horses and vehicles drawn by horses are to be kept off it."

Imposing Display in Duquesne Garden, Pittsburg, Where the Show's the Thing During the Present Week.

PITTSBURG SHOW BRILLIANT SUCCESS.

PITTSBURG, PA., April 6.—When the Smoky City's 43 automobile dealers, representing no less than 82 different manufacturers of cars, get together and bend their efforts toward the attainment of an object, the result is a foregone conclusion. What they can do was amply illustrated when the doors of the Duquesne garden were thrown open on last Saturday afternoon. Pittsburg is young in the automobile show business, as this is but her second attempt. That the 1907 show was a complete success in every way goes without saying, but the manner in which even that laudable effort has been surpassed in the present event is enough to make manager Thomas L. Cochran and William M. Murray, president of the local trade association, swell with pride. Their contemporaries on the special show committee are W. H. La Fountaine and Earl Kiser.

Prominent among the exhibitors of complete automobiles are two newcomers in the shape of distinctively Pittsburg cars, one being the Belden, of which E. H. Belden is the inventor and which will be manufactured here on a small scale this year, while the other is the six-cylinder roadster being turned out by the Fort Pitt Automobile Company, at New Kensington, a few miles from here. Pittsburg's part in the making of accessories is well represented in the display of the Pittsburg Auto Top & Equipment Company; L. Glasenkamp Sons & Company, manufacturers of limousine bodies; the E. J. Thompson Company, who are also makers of limousine bodies; the Air-Tight Steel Tank Company; the Auto Tire Repair Company; the Auto Specialty Manufacturing Company makers of windshields and Joseph Woodwell & Company, who show a general line of accessories.

The Pittsburg Dealers' Association is issuing an attractive souvenir program giving considerable automobile information, such as routes, maps and the like, and has good reason to congratulate itself on the great success of the show.

Automobile Exhibitors.

Allegheny Automobile Co.—Pierce-Racine, Rapid Truck.
 American Automobile Co.—Pope-Hartford, Pope-Waverley, Pope-Tribune.
 Arlington Motor Car Co.—Jackson, Acme.
 Banker Brothers Co.—Pierce-Arrow, Stevens-Duryea.
 Belden Motor Car Co.—Belden.
 Bellefield Motor Car Co.—Couple Gear Freight Wheel Truck, DeLuxe, Pennsylvania.
 Bensen, B. F. & Co.—Rapid Motor Vehicle Truck, Rainier.
 Collins, D. P. & Co.—Lozler, Moon, Studebaker Electric.
 Colonial Automobile Co.—Pope-Toledo, Apperson, Baker Electric.
 Central Automobile Co.—Reo, Premier.
 Diamond Automobile Co.—Buick.
 Fort Pitt Automobile Co.—Locomobile, Oldsmobile.
 Fort Pitt Motor Mfg. Co.—Pittsburg Six.
 Hilland Automobile Co.—Peerless.

Iama Motor Car Co.—Royal Tourist, Corblin.
 Imperial Motor Car Co.—Cadillac.
 Keystone Automobile Co.—Welch, Stoddard-Dayton, Columbia Electric.
 Liberty Automobile Co.—Mitchell, Wayne, Mora.
 Pittsburg Motor Vehicle Co.—Pittsburg Truck, Babcock Electric.
 Miller Bros.—Model.
 Standard Automobile Co.—Packard, Franklin.
 Schroeder Automobile Co.—Payne-Modern, Cameron.
 Wilkinsburg Automobile Garage.—Elmore.
 Winton Motor Carriage Co.—Winton.
 The White Co.—White Steamer.

Accessories Exhibitors.

Acetyvone Co.	Henry Hubbard.
Atlantic Refining Co.	Iverson Mfg. Co.
Air Tight Steel Tank Co.	Kowalsky, Jno., Motor Works.
Auto Igniter Co.	Kent, A. E.
Automobile Specialty Co.	Motor Tire Repair & Supply Co.
Barcus, J. C., Farina, Ill.	March Metts.
Bowser, S. F., Tank Co.	Morton, U. F.
Banker Bros. Co.	N. Y. & N. J. Lubricant Co.
Cleanola Co.	Oakmont Motor Boat Co.
Doubleday-Hill Electric Co.	Pittsburg Auto Tire & Repair Co.
Davies, J. P. & Co.	Pittsburg Hardware & Home Supply Co.

Gibney, Jas. L. & Co., Continental Tires.	Warner Instrument Co.
Hartford Suspension Co.	Whitmer & Rung.
Hartford Rubber Works Co.	
Half-Nelson Tire Co., Minneapolis, Minn.	

MONTREAL SHOW IN SUCCESSFUL PROGRESS.

MONTREAL, QUE., April 6.—Montreal's third annual Automobile and Sportsman's Show opened in the Arena Saturday night. All the spaces are occupied, and several of them overoccupied. It is, of course, too early to form any estimate of the amount of business, but quite a number of out-of-town buyers are in attendance and others have intimated by letter or otherwise that they will be on hand. The exhibitors are quite optimistic as regards the week's outlook. The marine displays are a notable feature of the show.

The Automobile Club of Canada, under whose auspices the show is being held, are to be congratulated in having the joint cooperation of such an able show manager as R. M. Jaffray, who is assisted by Dai Lewis, of Buffalo. Duncan McDonald, the president of the club, introduced Mayor Payette of Montreal, who spoke briefly, and then the show was officially open. The decorations are those used at the Sportsman's show in Buffalo, and the general consensus of opinion is that nothing to equal it has ever been seen here before.

A SANE LAW GOVERNING AUTOMOBILING.

No longer the luxury of the few, but now the pleasurable and business necessity of the many, it is a natural sequence that the goings and comings of the automobile should be regulated by common-sense law, preserving the rights of other users of the road and establishing conditions to meet the requirements of the new method of transportation, destined, for economical and time-saving reasons, ultimately to replace vehicles.

Here is the kernel of the proposed New York State law—sponsored in the Senate by such an astute lawmaker as Armstrong and introduced in the Assembly by the experienced Merritt—and it refers to the much discussed miles-per-hour:

Speed Permitted.—No person shall operate a motor vehicle on the public highways of this State at a rate of speed greater than is reasonable and proper, having regard to the width, condition, and use of the highway at the time, and the general and usual rules of the road, or so as to endanger property, or the life or limb of any person.

Connecticut has successfully abolished all of the minor speeds up to 25 miles an hour, and now the Empire State appears willing to return actually to first principles—“having regard to the width, condition, and use of the highway at the time and the general and usual rules of the road,” etc.—and the changed attitude of the public seems to harmonize with this most sensible solution of the situation. “Trapping” for excess of eight miles per hour would no longer be possible; there would be no

enforcement of the “law” for purposes of revenue; tourists would not be mulcted for their day of “pleasure.”

But the inconsiderate autoist, who, though in a meagre minority, has brought trouble in plenty to the big majority, will find his pathway beset with difficulties in the way of surer identification, heavier punishment, and, finally, banishment from the highway if he does not curb his reckless abuse of the motor-driven vehicle.

Then, recognizing that he may use the road more frequently than the horse-drawn vehicle, the autoist has accepted the situation as he finds it at present and has willingly agreed to an annual registration fee at increased rates—provided that fee is expended in the maintenance of the roads over which he drives his automobile in the pursuit of both business and pleasure. But the fee is also designated as a tax, and the automobile will no longer be taxable as personal property.

While the law would not be exactly as the autoist would like to have it in every particular, it is by all odds the most progressive statute that has ever been proposed. As President Quayle of the New York State Automobile Association puts it: “It is a long step toward the day when motor vehicle laws will be as dead letters as are the bicycle laws passed fifteen years ago and still on the books.” And Armstrong was a vital factor in getting some excellent bicycle legislation. It seems perfectly logical that he should lend aid in securing the just rights of the automobile, as he did in obtaining equitable laws for the once great but now lowly bicycle.

AUTO SELLING PROSPECTS EXTREMELY GOOD.

That the unseasonable weather was responsible in large measure for much of the financial trouble that beset automobile dealers and makers last summer, long before what has since come to be called the “late depression” set in, is that much more cause for congratulation on the favorable weather conditions that now appear to be in prospect for this year’s selling season. The prospective purchaser of an automobile is not anxious to become the possessor of a machine unless there is some chance of using it and the freezing weather that prevailed last year, practically up to the end of what constitutes the better selling season for autos, namely, June 15, placed an effective damper on stocks in agents’ hands.

An open season such as the present gives a greater stimulus than any other single factor possibly could. Every autoist feels the influence of spring and begins to plan runs and tours. Cars that have been laid up for the winter are taken out, and those that have seen constant service during the cold weather are given an overhauling. The man who has been deferring the purchase of a car feels that he can no longer put it off; new accessories are needed by those who already own cars, and, in a hundred and one different ways, business immediately begins to feel the effect of the stimulus afforded by a favorable season. When it is considered what the industry has passed through—practically unscathed—it may well be said that prospects were never better. Much that was undesirable has been weeded out, and, as a whole, the industry has been benefited far more by the process than it has been harmed. It is quite probable that the present season’s business will show it.

NEW YORKERS CONTEND FOR COMMON-SENSE LAW

ALBANY, N. Y., April 6.—A bill regulating the use and identification of motor vehicles while operated on the public highways of the State was introduced in the Senate and Assembly on Friday last. Senator W. W. Armstrong, well remembered as the man responsible for the once famous bicycle baggage bill and chairman of the insurance investigations, stands sponsor for the bill in the Senate. In the lower house, Assemblyman Merritt is the introducer. The bill is understood to represent the result of several conferences between the New York State Automobile Association representing the motor users of the State, and the prominent members of the Legislature, and will undoubtedly become a law. It will take the place of the present Motor Vehicle law passed in 1904. It follows quite closely the so-called Uniform Motor Vehicle bill proposed by the American Automobile Association and now being considered by the legislators of other States, and will take effect July 1, 1908. Commenting upon the measure, President O. A. Quayle, of the New York State Automobile Association, says:

"The bill makes several notable changes in the present statute. To meet the prevailing view that motor vehicles seriously injure the improved highways and should, therefore, contribute a considerable sum toward the maintenance of such highways, the bill substitutes for the present small registration fee an annual registration tax graded upward from \$5 for small vehicles, and dependent upon the weight of the vehicle. This, it is estimated, will result in a revenue which, under the terms of the bill, must be used in the maintenance of the improved roads of the State, amounting to upwards of \$400,000. The registration tax includes the furnishing by the State without cost of the two number placards which the new bill requires every vehicle to carry.

"Recognizing that this fee is a tax, the bill exempts all motor vehicles from taxation as personal property. Vehicles used solely for commercial purposes will be registered at half the fees required of the owners of pleasure vehicles, in no event more than \$10, and will not be exempted from ordinary taxation.

"The bill also includes several clauses making far easier identification; thus it requires new numbers annually, the number plates to be of different color each year. More, it requires that these numbers be displayed on both the front and rear of the vehicle; that they be fixed rigidly to the vehicle so as not to swing, and that the rear number be illuminated at night. Still further, and perhaps more important, the display of any number on a motor vehicle other than that issued by New York is prohibited.

"As a means to the detection of chronic offenders, the Secretary of State is required to furnish each county clerk with a list of registered vehicles and registered chauffeurs, and provision is also made for the entry on these lists of the records

of violations of the new speed provisions of the proposed law.

"It being thought that the time is come when the common law rule applicable to the speed of horse-drawn vehicles can be applied to motor vehicles, the arbitrary limit of miles per hour is eliminated and permissive speed is made dependent solely upon the width, condition and use of the highway at the time, and the general and usual rules of the road. Conversely, it has been thought proper to make the penalties for the violation of the speed provisions of the law much more severe and to give a wide discretion in the matter of punishment to magistrates charged with the enforcement of the law. Hence, should the bill become a law, it will hereafter be possible for a magistrate to penalize excessive speeding by a fine of not more than \$250 for a first offense and by a fine not exceeding \$500 for a second offense, or imprisonment not exceeding six months, or both. In no other way has it been thought possible to enforce the common law rule as to permissive speed as above stated. Nor is it believed that the extreme penalty will ever be asserted against any but old offenders and those who by their conduct on the streets and public highways bring motorists generally into disrepute.

"The bill takes from local authorities all power to regulate the use of or to tax motor vehicles. The bill also provides that non-skidding devices may be used only when the highways are wet, slippery or covered with ice and snow, and contains the usual provisions exempting manufacturers and dealers from annual registration. There are also provisions requiring lamps, horns, brakes, and the like, and provisions compelling motorists to stop on signal, and exempting non-residents of the State from registration providing they have registered their vehicles under similar laws in their own States and that they display their State numbers when operating such vehicles in this State.

"It is thought that this bill, when passed, will mark the beginning of a new era in the treatment of motor users by government, and that it is a long step toward the day when motor vehicle laws will be as dead letters as are the bicycle laws passed fifteen years ago and still on the books.

"While its penalties will at first blush seem severe, the placing of the motor vehicle on a parity with all other vehicles on the highway and the removal of all arbitrary miles per hour restrictions is the high-water mark in motor vehicle legislation thus far. On the other hand the autoists of New York, thoroughly organized and militant, and thus able to make their views felt, are the first of the organized motorists of the world to formally recognize that until highways can be constructed that will resist the suction and wear of these vehicles and their rubber tires, government has the right to ask a toll or tax from such vehicle owners, which can be used in repairing the damage thus done."

VANDERBILT CUP RULES SET NEW WEIGHT LIMITS

A WEIGHT limit, which will bring all candidate cars within the present international restrictions in that particular and at the same time serve as a comprehensive standard of eligibility, was adopted by the Racing Board at its meeting, April 2, at A. A. A. headquarters, to discuss, determine and promulgate rules for the Vanderbilt Cup race for 1908.

This weight was set at a minimum of 900 kilograms or 1,983.6 pounds, and at maximum of 1,200 kilograms or 2,644.8 pounds, the previous sole limit having been 1,000 kilograms or 2,204 pounds. The minimum limit is that set for the next Grand Prix contest, in which there is no maximum weight limit, the cars being restricted solely to piston displacement.

Other rules of importance governing the next race for the

Vanderbilt Cup provide that 10 cars may represent any one country; that the entry fee for each car shall be \$1,000; that entries shall close on September 1, and that entrants after that date up to October 1, the date of the final closing of entries, shall pay double entry fees.

The date and route of the race will be announced by the Cup Commission not later than July 1. Already the nominations of two Locomobiles, two Thomas Flyers, two Appersons, a Darracq, and a Renault are practically assured.

The Savannahians, encouraged by the success of their stock car races, are hustling hard to comply with any requirement that may be made as to a longer course and assurances of their ability to accommodate the visiting throng. Missourians have not given

up hope that the choice of the course may fall upon St. Louis. A course in Connecticut has also put forth tentative claims to consideration.

The racing rules submitted by the special committee, made up of Jefferson deMont Thompson, A. L. Riker, S. A. Miles and Alfred Reeves, were considered and slightly amended. They will be promulgated later.

Frank C. Battey, president of the Savannah Automobile Club, was appointed a member of the Racing Board by Chairman Thompson. A resolution was unanimously adopted extending a vote of thanks to President Frank C. Battey and officers of the Savannah Automobile Club, Mayor George W. Tiedeman, Major

William B. Stephens, and Captain R. J. Davant, in command of the military forces patrolling the course, Captain W. G. Austin, chief of police of the city of Savannah, the trade and civic bodies, Governor Hoke Smith, General Clifford L. Anderson, and other State officials, for their splendid cooperation and support in the successful conduct of the automobile races.

The racing Board members in attendance at the meeting were Jefferson deMont Thompson, chairman; Frank G. Webb, M. Rossiter Worthington, Harry W. Knights, A. G. Batchelder, Alfred Reeves, A. L. Riker and Frederick H. Elliott, secretary. Telephonic communication was had with W. K. Vanderbilt, Jr., concerning cup-race matters.

CHAIRMAN THOMPSON OFFERS CUP FOR STOCK CAR EVENT

THERE was a meeting Tuesday morning last in New York City, at the offices of the American Automobile Association, 437 Fifth avenue, of the Central Conference committee, representative of the American Automobile Association, the National Association of Automobile Manufacturers, and the American Motor Car Manufacturers' Association, at which the following representatives were present:

Representing the A. A. A.—President Wm. H. Hotchkiss; Chairman Thompson, of the Racing board; Chairman Hooper, of the Good Roads board; Chairman Hower, of the Touring board; F. H. Elliott, secretary; L. H. Speare, first vice-president; O. A. Quayle, president New York State Automobile Association.

Representing the National Association of Automobile Manufacturers.—S. D. Waldon, Windsor T. White.

Representing the American Motor Car Manufacturers' Association.—Alfred Reeves, R. M. Owen, Harry Fosdick.

Numerous matters of common interest to such bodies were discussed, among them the following:

Touring.—Chairman Hower of the Touring board of the American Automobile Association outlined his plans in connection with the tour and asked for suggestions from the representatives present in regard to the fifth annual reliability touring contest for the year 1908, and received several suggestions which will be incorporated in the rules.

Racing.—The racing season being about to open, Chairman Thompson of the Racing board asked for suggestions in connection with the miscellaneous races on circular tracks, and also in connection with the Vanderbilt Cup race. He announced that the Cup race would certainly be held, and that negotiations for a course in the States of Missouri, Georgia and Connecticut were already well

under way. He called attention to the success of the recent Savannah stock touring car races. The representatives of the manufacturers present suggested that there should be but one contest of the latter kind each year, and that it should be international in its character.

This view met with the approval of all of the representatives present, whereupon Chairman Thompson announced that if the manufacturers would support such an international contest, he would be pleased to give to the American Automobile Association, as the national governing body, a cup valued at \$3,000, to be known as the Jefferson DeMont Thompson Cup, similar to the Gildden and Vanderbilt trophies, which might be competed for solely by stock cars in one great annual event. His offer was enthusiastically approved, and the representatives of the manufacturing bodies stated that they would present the matter to their associations at the first possible opportunity. It is likely, therefore, that hereafter there will be one great classic event for stock touring cars in this country.

Buffalo Convention.—The proposed convention of the American Automobile Association, to be held at Buffalo coincident with the beginning of the fifth annual tour, was also considered, Chairman Hooper of the Good Roads board being present. It was the opinion of the various representatives that good roads should be the keynote of such convention, and that, if possible, other organizations interested in the subject be asked to co-operate.

Sanctions.—Numerous applications which are being made for sanctions for endurance contests and hill climbs were brought to the attention of the Conference committee, and the representatives of the manufacturers' associations assured the A. A. A. that it would stand back of such association in granting or withholding sanctions for such contests as well as any similar action as to races on circular tracks.

New York Bill Approved.—The pending bill for a new motor vehicle law in the State of New York was also brought up for consideration and discussed.

Other Conferences.—The conference is doubtless the first of several which will be held during the summer season, and illustrates the close relationship which exists between the representative body of motor users in this country, viz.: the American Automobile Association and the representative bodies of automobile manufacturers, viz.: the National Association of Automobile Manufacturers and the American Motor Car Manufacturers' Association.

PRESIDENT BATTEY PRESENTS SAVANNAH'S PROPOSITION

THE monthly meeting of the executive committee of the American Automobile Association, held Tuesday afternoon at the national headquarters, No. 437 Fifth avenue, developed the fact that no report has yet come from the Judiciary committee of the House of Representatives concerning the Federal Registration bill. President William H. Hotchkiss stated that, despite a news dispatch printed with a Washington date, he was positively informed that the committee had yet to reach a decision on the matter.

The Kentucky State Automobile Association was admitted to membership, now possessing the requisite three clubs.

Chairman F. B. Hower of the Touring board reported the rules for the annual tour, which were adopted without discussion.

Chairman J. D. Thompson of the Racing board presented the revised racing rules, which, with slight modifications, were adopted.

The Technical board was authorized to draft rules for technical contests and reliability runs and tours, and asked to report at the May meeting of the executive committee.

Mr. Battey thoroughly presented the claims of Savannah as a place for the holding of the Vanderbilt Cup race, read a letter from Governor Hoke Smith guaranteeing sufficient troops for the guarding of the course, and said the Georgia city would provide comfortably for all who come to see the race. Since the

matter is one for decision by the Vanderbilt Cup Commission, Savannah's application was referred to that body, which is practically the Racing Board of the A. A. A.

S. D. Waldon, representing the N. A. A. M., and Alfred Reeves, representing the A. M. C. M. A., were announced as being added to the executive committee for the Buffalo convention.

Present were: President William H. Hotchkiss, O. A. Quayle, Jefferson DeMont Thompson, F. B. Hower, A. G. Batchelder, of the New York State Automobile Association; L. R. Speare, Massachusetts State Automobile Association; G. E. Farrington, Associated Automobile Clubs of New Jersey; Windsor T. White, Ohio State Automobile Association; Robert P. Hooper, Paul C. Wolff, Pennsylvania Motor Federation; F. C. Battey, Savannah (Ga.) Automobile Club; Secretary F. H. Elliott.

CLEVELAND'S CLIMB TO BE HELD JUNE 13.

CLEVELAND, O., April 7.—The date for the annual Cleveland hill climb, originally announced as May 30, has been changed to June 13, in order that there may be no conflict with other events of a like character in other cities on the same date.

The annual meeting of the Ohio State Automobile Association has been set for June 13, the date of the hill climb.

PEOPLE WHOSE SAY-SO IS WORTH WHILE.

Roy D. Chapin, Thomas Detroit Motor Car Co., Detroit, Mich.: "On my return from my trip to the Pacific coast I found conditions at the factory most satisfactory. They are working day and night shifts and on Sunday too though, perhaps, I ought not to let that cat out of the bag. We have produced more cars to date than last season and have led our 1907 production every month except February and March. Sales though, were 25 ahead of March of last year. I always watch the spare part department demands with interest, for its reports always show the weak spots in a car. There seems to be no demand yet for parts for our 1908 car, so I infer it is standing up all right. In fact, I think that this year in the Thomas Detroit we have a mighty well balanced car."

H. O. Smith, Premier Motor Car Co., Indianapolis, Ind.: "I am glad to see that the A. A. A. has decided to officially call this year's tour a reliability contest. I have always been opposed to the name of tour, as it makes the event appear more like a joy ride. The object of the event is to demonstrate the reliability and staying qualities of the cars entered, rather than an affair for a good time, as the word tour implies. The contest for the Glidden trophy as conducted by the A. A. A. has accomplished wonders for the industry as it has shown the public that the American-built car is capable of withstanding the most severe tests and can perform the exacting duties expected of it over all kinds of roads and under trying circumstances."

E. H. Parkhurst, Peerless Motor Car Co., Cleveland, O.: "In my opinion, the talk of depression in the automobile business is not borne out by facts. In comparison with other industries near Cleveland, I find we have maintained a larger proportion of our full factory force at work than in any other industry of similar size. What depression there has been is incidental to general business depression. In spite of all the talk, our deliveries for March were greater this year than last."

Benjamin Briscoe, Maxwell-Briscoe Motor Co., Tarrytown, N. Y.: "Every Spring one hears the question asked, 'Of what use is automobile racing, what good purpose do hill-climbing contests serve, of what practical value are records made in economy, reliability, sealed bonnet, and other stunts?' Participation in these contests is expensive; but I believe they are worth all they cost. Of course, if the maker could sell his product, unsight-and-unseen, have the money he expends in advertising in various forms, eliminate the agent and realize a lot of other weird dreams, it would be fine—for the maker. But it has been ordained that nothing may be had without effort or cost, and to this the automobile buying public has added the further condition, 'You'll have to show me.' Contests do show them."

W. H. Van Dervoort, Moline Automobile Co., Moline, Ill.: "New Yorkers live too near Wall Street. They ought to take a trip West, get a breath of fresh air, and throw off the scare. Why, out in Moline we heard about a 'panic,' but until I saw the blanched faces here I didn't know such a strong term was necessary to express the conditions. Lately the banks have loosened up for all we needed, so we suppose the little unpleasantness had passed and been forgotten. But you don't seem to know the war is over yet."

DETROIT'S BOARD OF COMMERCE IMPRESSED.

DETROIT, April 6.—One afternoon last week the Detroit board of commerce was impressed with the magnitude of the automobile industry. The board had decided to make a tour of the many large factories in Detroit, and began with a visit to the Packard plant. The party was carried from the Board of Commerce Building to the Packard factory in a dozen Packard cars, and then made the tour of the different departments of the factory under the guidance of Sales Manager Waldon, and with other Packard executives to explain the why and wherefore of

motor car construction. The general opinion was expressed by Secretary Ritchie, as follows:

"When we laid out Detroit's Boulevard, we had no idea that any factory with eleven acres of floor space would be built on it. Nor did we know until to-day, that such a thing had been accomplished. Of course, it is natural that a manufacturing company should choose such an advantageous site as the junction of the Boulevard and Belt Line Railway. And we are glad that this location has the country's largest automobile factory, in beautiful modern buildings, instead of the clutter of shanties which generally characterize railway crossings."

Even those of the board who had barely a speaking acquaintance with things mechanical were visibly impressed by the fact that hundreds of diversified lines of work, employing high-grade machinery and skilled labor from nearly all branches of industry, had been organized into a smoothly running system for just the one purpose of manufacturing Packard cars.

POWERFUL RACERS FOR MONACO BOAT MEET.

PARIS, April 1.—Paris having sent away its annual load of motor boats for the Monaco exhibition and races, speculation is rife as to the records that may be made by the fast craft. From April 1 to 4, the public exhibition and trials will take place, the competitive races opening on Sunday, April 5, for cruisers only. The real interest centers round the last days of the meet, when the championship of the sea, the mile and kilometer, and 50 kilometer events are held.

Half a dozen boats stand out prominently as possible creators of record speeds, the most popular among them being the *Panhard-Levassor*, a 49-foot boat, built by Tellier of Paris, and engined by Panhard. The power plant consists of four Panhard motors of four cylinders each, grouped in tandem, and operating two propellers. Each cylinder having a bore of 7.2 inches, the rating of 120-horsepower per engine, or 480 for the entire plant, is not exaggerated. In the trial spins on the Seine, before being shipped for the South, the *Panhard-Levassor* attained a speed of 38 miles an hour upstream, and 39 miles with the current, which is certainly remarkably fast going for a preliminary test. In the smaller series, Tellier and Panhard will be represented by the *Rapier III.*, successor in a series of exceptionally fast boats.

Brasier will be represented by the *New Trefle*, owned by the English sportsman, Mr. Thubron, and prepared for the races by Gustave Caillois, after an unsuccessful showing last year. A second Brasier, to sail under the name of the *Grand Trefle*, has its steel hull filled with three powerful Brasier racing motors, rated at 130-horsepower each. Despujols, who built the hull, appears to have erred in not sufficiently protecting the engine from water. In a calm sea the boat should be able to get near to 40 miles per hour, but it is doubtful if she will be able to maintain a high rate of speed in a swell.

Italy will send the *Jeanette*, owned by Vincenzo Florio, and equipped with a couple of 120-horsepower Itala engines. *Fiat-Gallinari* has in her 40-foot hull a couple of six-cylinder engines, developing a total horsepower of 250. The boat is looked upon as one of the most serious rivals of the French fleet.

Great Britain is pinning her faith to the *Wolseley-Sidley*, built by Saunders, one of the most skilled of British boat builders, and engined by the Wolseley firm. Its power plant consists of a couple of eight-cylinder motors, developing 200-horsepower. The engines are placed side by side in the hull, and operate independent propellers. In Southampton waters, the English boat attained a speed of over 30 knots an hour. Her victory is looked upon as certain if the weather is rough. *Scarlet Runner*, which will compete under the Union Jack in the small racer class, is only looked upon as a winner under rough weather conditions.

America will not be represented in the racing classes, W. H. Fauber, well known in the States in connection with the bicycle industry, has promised a new type of boat with aerial propeller, but, according to the latest indications, has not been able to advance the work sufficiently to appear at the Monaco meet.

Roomy Lines of the New Renault Taxicabs.

LACROIX' NEW RENAULT TAXICAB LINE.

By the way of a nucleus of a new taxicab line just started in New York, Paul Lacroix has secured a 10-14-horsepower Renault of this kind. It will be followed by some 50 others, which are expected to arrive from France before July 1, though within a month it is anticipated by Mr. Lacroix that enough will have come to have 20 cabs in operation. The Renault taxicab in question has two seats upholstered in leather, electric lights, hanging speaking tube, cigarette case, ash receiver, and other fittings, and is equipped with four anti-skid tires. Special attention has been paid to providing easy riding springs. The headquarters of the service will be at the Renault branch, Broadway and Fifty-seventh street, though stations at three prominent restaurants have been arranged for by Mr. Lacroix.

ANOTHER TAXICAB FROM THE WEST.

One of the latest entrants into the field of taxicab building is the Jackson Automobile Company, Jackson, Mich., and the result of their efforts in this direction is illustrated by the accompanying photograph. This newcomer to the Jackson fold has a 90-inch wheelbase, 30-inch wheels and 3 1-2-inch tires. It is equipped with a 2-cylinder, 16-horsepower, horizontal, 4-cycle, water-cooled motor, and has a planetary change-speed gear, giving two speeds forward and reverse, so arranged that they may be operated by pedals, for convenience in city driving. It is hung on full-elliptic springs in the rear and semi-elliptic front. The car is geared for a speed of 25 miles an hour, and is built to carry four passengers inside. Some of them have already been delivered in New York and Boston, where they are greatly admired. Durability and economy of maintenance have been the chief objects of the designer, and the car claimed to greatly excel in these features.

First of the Horizontal-Engined Taxicabs.

FIRST "PITTSBURG SIX" ON THE ROAD.

NEW KENSINGTON, PA., April 6.—On the occasion of its test, made recently by the designer, B. G. von Rottweiler, the first "Pittsburg Six," as the new cars being turned out by the Fort Pitt Motor Manufacturing Company are known, showed a speed of 68 miles an hour. Mr. von Rottweiler has been building four-cylinder cars in Europe for a number of years, and until recently would not hear of lengthening the motor by an additional pair of cylinders. Now he is an enthusiastic six-cylinder advocate, and his new creation has exceeded his fondest expectations in the way of power and speed. Foreign lines have been very closely followed, as may be seen from the accompanying photograph of the car, as it has the Mercedes type of radiator, axles and wheels. The motor is capable of delivering 75-horsepower at 1,000 r.p.m., its normal speed being lower than this. The car lists at \$2,100, completely equipped as shown.

At the present writing, Mr. von Rottweiler is working on a special six-cylinder racing car, to have a motor measuring 162 mm. bore by 155 mm. stroke, and to give 160-horsepower, which, he thinks, will be the fastest thing on wheels. When it is completed, he expects to issue a general challenge to all comers for a trial of speed, which should prove interesting.

"Pittsburg Six," a Newcomer from the Smoky City.

FAIRWEATHER CLUB HONORS COL. PARDEE.

NEW YORK CITY, April 6.—High flights of oratory were handed out to a hundred members of the Fairweather Club on April 1, when they gathered at the Cumberland Hotel for their second dinner, with Col. K. C. Pardee, manager of the Maxwell-Briscoe local branch, for the guest of honor. There were a pair of speakers in hand of almost national reputation. The toastmaster, Henry M. Duncan, who has charge of the automobile department of J. B. Brewster & Co., also proved himself capable as an after-dinner talker a bit above the average, and perhaps the best heard at the general run of trade and club banquets. He had pretty poetry to quote galore, and springtime thoughts.

Colonel Pardee, after making his acknowledgments of the compliments paid to him, switched to a historic outline of the birth of the motor microbe, a review of its growth, and a peroration as to its future.

Then came John S. Crosby, a follower of Henry George, who, after touching humorously for a few minutes on the automobile, launched forth in an oration on "The Right of Way," pleading for the right of man to life, liberty, property, contract and land.

Benjamin Briscoe thought that Mr. Crosby was a bit too severe on corporations and suggested that they were, perhaps, after all, but a forerunner of co-operation and mutuality of human endeavor.

Creswell McLaughlin, editor of *The Schoolmaster*, after some funny stories and merry quips, switched to a warning of the dangers besetting the republic, with a glowing tribute to President Roosevelt for his courage in battling against them. "Tom" Moore also talked, with the Briarcliff race for a topic.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The completed stock and supplies of the Dragon Motor Company have been sold to the Gorson Auto Exchange, 617-619 Arch street, Philadelphia.

Monday at 10 A.M., the first day of New York City's Carnival Week, Percy Williams purchased from Paul Lacroix a 35-45-horsepower touring car. This is the first recorded sale of Carnival Week.

The Matheson Automobile Company, of Wilkes-Barre, Pa., employing 400 hands, resumed operations on April 1 after two months of idleness. Orders have been received for \$400,000 worth of cars and all the old hands were put back to work.

In the issue of THE AUTOMOBILE of March 26, on page 452, H. R. Teele was given as the patentee of the tire case shown. This was an error, as the patentee of the case in question is F. B. Hopewell, of Hopewell Brothers, Cambridge, Mass.

Andrew Carnegie, the well-known ironmaster, has purchased a Studebaker car for his tour through the Scottish Highlands the coming summer. The car is equipped with a low-g geared axle and a strongly reinforced limousine top, for the purpose of carrying heavy baggage and touring equipment.

A new repair shop and garage has been opened at Peoria, Ill., at Madison and Liberty streets, by Phil Stein and Clarence Christ. They will make a specialty of catering to users of the Glide car, which are numerous in its home city. Both members of the firm were formerly connected with the Glide factory.

The Rochester Tire Company, Rochester, N. Y., capitalized at \$20,000, filed its certificate of incorporation last week. The concern will deal in automobiles, and the directors are Percy W. Hodgkinson, Robert B. Cochrane, Emil Broeker, Charles H. Hall, Thomas J. Thurber, Richard P. Martin, and Charles D. Camp.

Complete to the minutest detail, the handsome new salesrooms and garage of the Bergdoll Motor Car Company, at 325-327 North Broad street, Philadelphia, will be thrown open to the public during the present week. "Open house" with all the usual floral, musical and gastronomical trimmings will be in order.

In the recent automobile races held in Havana, Cuba, a Winton Sixteen-Six won the race for runabouts of 25-50-horsepower, defeating one American and four foreign entries. The time was 2:11 3-5, over a 1.7-mile course, with one sharp and very dangerous turn. The second car finished four seconds later, and the last foreign car was 31 seconds behind.

The affairs of the Boyer Motor Car Company, of San Francisco, are being wound up. The company suffered two fires during the past year, and was unable to successfully pull through the recent business depression. The Boyer Company handled the Franklin and Royal lines. Mr. Boyer will continue as a leading selling factor with the new Franklin agency, the Consolidated Motor Car Company.

Wm. P. Miller's Sons, Long Island City, N. Y., manufacturers of Pan-o-lite oils and greases have begun the erection of a new factory and office building on Hancock street, near Webster avenue. The building

will be brick and iron, two stories high, and will give the concern the much needed room it desires to handle its growing business.

The Corbin Motor Vehicle Corporation, of New Britain, Conn., has increased its capital stock from \$200,000 to \$500,000. The increase was made necessary by the expanding demand for its product, which had to be met with increased facilities for production. The company states that the sales of Corbin cars for the first three months of the present year far exceed those for the same period of last year.

RECENT BUSINESS CHANGES.

The Penn Motor Car Company, agent for the Mitchell car in Philadelphia, removed last week from Broad and Ridge avenue to new and much larger quarters at 138-140 North Broad street.

Owing to the necessity of being located at a better distributing point, the Slama Tire Protector Company has removed its general offices from Humboldt, Neb., to 609 East Fifteenth street, Kansas City, Mo. The factory will remain at Humboldt.

The Continental Caoutchouc Company, which has had its headquarters for a number of years at 43 Warren street, New York City, announces its removal to 1788-1790 Broadway, corner of Fifty-eighth street, the premises formerly occupied by the Baker Electric Company. The Continental people will take immediate possession. General Manager Gilbert reports an increasing demand for Continental tires this season, particularly for the new demountable rim carrying ready-flated tires.

NEW AGENCIES ESTABLISHED.

The Babcock electric was last week added to the long list of cars represented in Philadelphia. Prescott Adamson, Broad and Spring Garden streets, who handles the Columbia gasoline and electric cars, will look after the interests of the new comer in the Quaker City.

The Consolidated Motor Car Company, 402-406 Golden Gate avenue, San Francisco, has taken the agency for the Franklin and will be exclusive Franklin dealers in that city. The officers of the company are: President and manager, S. G. Chapman; vice-president, J. H. Doust; secretary, Max L. Rosenfeld. Other new Franklin agencies established are with the Brown Brokerage Company of Coffeyville, Kans., which has opened a new modern salesroom and garage, and with W. B. Jernigan, who will open a new salesroom and garage at Pensacola, Fla., and handle the Franklin exclusively.

New agencies for Jewel automobiles have been established by the makers the Forest City Motor Car Company of Mason, O., as follows: Jewel Automobile Company, 210 Temple Court, Denver, Col.; J. A. Lory, Rock Rapids, Ia.; Wm. Tobin, Decorah, Ia.; L. N. Simon, Goff, Kans.; Henry Humfreville, Waterville, Kans.; Edward C. Hubert, New Orleans; L. E. Gordon, Deer Lodge, Mont.; M. J. Cook, Holland, Mich.; Boyce Carriage Company, 324 Ross avenue, Winnipeg, Canada; O. S. Sagmoen, Cray, North Dakota; M. A. Grant, 1016 Prairie avenue, Houston, Tex.; Herman F. Gerhard, Austin, Tex.; C. H. Dean, 226 South Flores street, San

Antonio, Tex.; Ray-Wortham Company, 609 Throckmorton street, Fort Worth, Tex.; Auto Service & Motor Company, Cheyenne, Wyo.; Coatsville Carriage Company, Coatsville, Pa.

PERSONAL TRADE MENTION.

Charles B. Shanks, sales manager of the Winton Motor Carriage Company, Cleveland, O., is taking the baths at Mudlavia, the famous Indiana health resort. Major H. L. Kramer, proprietor of Mudlavia, is a Winton enthusiast of long standing.

Leman Greenwald has resigned as superintendent of the Empire State Tire Company of Buffalo, N. Y., to whom he sold one of his inventions, the Greenwald internal protector. Mr. Greenwald will devote his time to perfecting some other inventions in the tire equipment line, a public announcement of which will be made later.

Carl Kaufman, general manager and treasurer of the Motor Car Equipment Company, 55 Warren street, New York City, sailed for Europe on Tuesday, April 7, where he will spend two months getting into touch with the leading manufacturers of automobile equipment and supplies, and place large orders for the new goods on the European market.

Dr. Chas. G. Percival, until the beginning of the present month sales manager and publicity promoter for the Cleveland Motor Car Company, of New York City, will, in the future, be associated with F. Edward Spooner in conducting the automobile department of the A. W. Erickson Advertising Agency, and in the publicity work of Mr. Spooner. Dr. Percival has been identified with the automobile industry since its earliest inception in this country as a publicity expert.

Through the efforts of the E. A. Jenkins Motor Company, R. M. Owen, of R. M. Owen & Company, general sales agents for the Reo and Premier lines, was given an enthusiastic reception on his recent visit to Columbia, South Carolina. He was made the guest of honor at a banquet at which most of the prominent autoists in that vicinity were present. At this banquet a movement was started to improve the road between Columbia and Camden, S. C., and almost \$1,000 was subscribed.

Charles M. Steele, a former Chicago newspaper man, has joined the E. R. Thomas Detroit Company. Mr. Steele will have charge of all publicity for the Thomas Detroit Company and will assist Lee Counselman, the sales manager. Mr. Steele comes from the H. H. Franklin Mfg. Co., of Syracuse, N. Y., where he held the position of advertising manager. Prior to his connection with the Franklin Company he was in charge of the publicity department of the National Cash Register Company. Mr. Steele's work there first brought him to the attention of Hugh Chalmers, formerly general manager of the cash register company and now president of the Thomas Detroit Company.

BYRON J. CARTER DEAD.

DETROIT, MICH., April 7.—Byron J. Carter, vice-president and general manager of the Motor Car Company of Detroit, and inventor of the friction type of drive applied on the well-known Carter car, succumbed to pneumonia yesterday.

INFORMATION FOR AUTO USERS

Rex T-socket Wrench.—There is no task so difficult as that of making repairs or adjustments without the aid of the proper tools, and autoists have learned to their cost only too often that tools made for ordinary purposes are not suited to the special needs of the automobile. This is particularly true of the wrenches generally provided, for despite the best efforts of the designer, it is impossible to make every part of the mechanism of a car as accessible as it would have to be in order to permit of reaching it with an ordinary wrench. Many nuts and bolts have to be turned around a corner, and here is just where the value of a special set of wrenches, such as the Rex, comes in. It is being manufactured and marketed by the Rex Wrench Company, Boston, Mass. A Rex wrench outfit consists of a full set of interchangeable steel sockets of special form and a handle to which they may be attached and instantly locked at any desired angle. These sockets are in a series, comprising the standard sizes of nuts. The crossbar in the handle may be firmly set at any position to give the best hold for getting into corners. Screwdriver and spark plug wrench parts are also provided, and may be fastened to the handle in the same way.

REX WRENCH AND PARTS.

Automatic Fuel Feed.—One of the greatest drawbacks of the early steam automobiles was the difficulty encountered in maintaining a constant and uniform fuel feed. To overcome this, F. W. Ofeldt & Sons, Nyack-on-the-Hudson, N. Y., have invented and perfected a device which they term an "Automatic Fuel Feed." Its greatest advantage is that it does away with air pressure for feeding the fuel and saves much laborious pumping that makes running a steamer far from a pleasure at times. It permits of any quantity of fuel being put into the tank, and of the tank being examined at any time to learn how

much it holds, without loss of pressure and the consequent necessity of hand pumping. It gives from 100 to 150 pounds pressure for starting the burner in half a minute or less, by operating a small fuel hand pump

OFELDT AUTOMATIC FUEL FOR STEAM CARS.

with the thumb and forefinger. A perfectly tight fuel line is always possible with it, as any leaks can be seen and repaired, and it makes the steam car the easiest to start, in addition to making it far safer than where a large tank of kerosene or gasoline is constantly carried under a high air-pressure, as in the Ofeldt system, only about three pints of fuel are under pressure at one time in the 18-inch automatic fuel feed.

Electric Arc Searchlights.—To supply the demand for a *real* searchlight, i. e., one of the electric arc type, for automobile use, the Richardson Engineering Company, Hartford, Conn., has just brought out the style shown by the accompanying illustration. It is equipped with a Mangin mirror and takes current from a small direct-current generator run by the engine. Unlike previous attempts at this form of lighting direct from the generator, the new Richardson searchlight throws an effective beam at all speeds over a walk, and does not go out as long as the engine continues to run at anything above the rate at which it is

RICHARDSON ELECTRIC SEARCHLIGHT.

merely turning over. Naturally, the light is diminished at low speeds but the makers claim that it is greater than that given by an acetylene lamp, even under such conditions. At normal speed it is capable of lighting up comparatively small objects fully one-fourth mile away. D. A. Richardson has tried one of these searchlights out on his own car and found that the results surpassed his most sanguine expectations, as he was able to pick up large objects fully one-half mile away. The mechanism is strong, simple and durable, the lamp itself measuring 8 inches wide, by 12 inches long by 12 inches high, while the generator necessary to operate it is 7 1/2 inches in diameter and weighs 45 pounds. The dynamo is of the direct-current type, and has been designed especially with a view to this particular service.

Tray Plate Batteries.—In adapting accumulator to auto service for ignition, the chief difficulty encountered at the outset was the rough usage to which they were subjected, and which caused the plates to disintegrate, the active material soon piling up on the

bottom of the cell and short-circuiting the different elements. The Tray Plate Battery Company, 5 Frederick street, Binghamton, N. Y., have made a special study of the conditions of automobile ignition service and as a result have brought out a cell particularly designed to give the

TRAY PLATE IGNITION ACCUMULATOR.

maximum life and efficiency under rough usage. They have made a series of practical road tests extending over the past three years, and have found that their batteries will run a four-cylinder touring car as far as 3,400 miles on a single charge. The grids employed are constructed to give a large amount of active material with ample conducting surface for the current, and all materials used are chemically pure. The cells are so made that they may be inverted without spilling any of the acid, thus preventing corrosion of the terminals.

ANOTHER STYLE TRAY PLATE BATTERY.

The makers also guarantee the Tray Plate cells to be non-sulphating, so that they have a long life with a minimum up-keep expense. The accompanying illustrations show two types of complete batteries.

"Non-Gran" Bronze.—According to the makers of "Non-Gran" bronze bearing metal, "granulation is the basic cause of all cutting," and one of the greatest advantages of their product is that it is absolutely proof against granulation. It is positively smooth-wearing and works for long periods under constant, heavy service with a minimum of friction. The makers, the American Bronze Company, Berwyn, Pa., have been supplying a number of the most prominent American builders of cars for several years past, and are always ready to answer inquiries concerning the nature of their product as well as its adaptability for special forms of automobile service. Prime lake copper is the basis of the "Non-Gran" bronze bearing metals and everything used in its manufacture is of the highest grade.

THE AUTOMOBILE

Next the Race for the Briarcliff Trophy

WITH the carnival successfully disposed of, the Briarcliff Trophy race, which will be run over a 30-mile course in Westchester county during the forenoon hours of next week Friday, monopolizes the attention of the metropolitan automobile world. Dealers and importers and individuals have given the contest support to the extent of 22 entries, equally divided between the domestic and the foreign product. The American end of the contest will be held up by three Stearns, two Loziers, two Simplexes, a Thomas Flyer, an Allen-Kingston, a Hol-Tan Shawmut, and an Apperson. French importers will be represented by two Renaults and a Panhard. Rival Italian teams will be a Bianchi, a pair of Fiats, and a trio of Isottas. Austria will be in evidence with a Maja and Germany with a Benz.

The committee in charge has been lenient in its interpretation of the rules of the race restricting the cars to stock chassis, deciding that cars with Kaiserpreis equipment are eligible, on the theory that the big annual struggle in Germany is intended to be a race for touring cars, and by accepting other entries on the assurance that at least 10 cars of the competing model had been or would be built.

The normal difficulties of the course, arising from numerous sharp turns, narrow stretches, and an absence of macadam surface for nearly one-third of the way, are likely to be considerably magnified by soft and rough going on the dirt road sections due to early spring mud. These obstacles will, it is believed, come pretty near to placing all of the cars on a fairly even footing and leave the outcome largely dependent on the skill of the

pilots. It has been persistently reiterated by its promoters that the contest is intended to be a test of stock chassis under touring conditions rather worse than normal. It looks now as though the conditions alleged to have been aimed at had been secured to an extent a bit beyond the hopes of the management or the expectations of those that made the entries. A fortnight ago there was some talk of the advisability of a postponement to a later date, when a dryer and better prepared course might be expected; but the entrants decided to take all risks, and voted against a postponement. The question of added practice expenses and the original promise of the promoters to furnish the local trade with an event that should stir up spring business a bit earlier than formerly, were also among considerations that influenced the New York tradesmen in their vote against postponement.

Criticisms of the unpreparedness of the course by the entrants and the local press have spurred the committee in charge to greater efforts to eliminate the early spring ruts and mud holes, and not only possible but fair racing conditions are promised by the promoters by the day of the race, and perhaps in time for a little more universal practice with the competing cars than prudence has so far permitted. Much of the preliminary training thus far has been confined to a study of the sharp turns in touring cars. Spring rains have been a delaying factor in this preparation of the course, and difficulties have been added to the work by the general character of the country, which is hilly, and, therefore, subject to miniature streams that seam the surface.

Drivers Who Have Won Their Spurs.

The American racing world has been explored for its best drivers, and eighty per cent. of the pilots signed have won fame or are more or less well known as contestants in prominent racing events. The Stearns people have secured a rather formidable trio in Oldfield, Vaughan and Leland. It will be the track champion's first essay at road racing. Vaughan and Leland have both scored successes in track races and hill climbs, but they, too, have not heretofore figured in road events. The Isotta aggregation has picked up a clever trio in Strang, who won the Savannah cup; Poole, who was Tracy's mechanic in his big races, and Harding, who won the 1906 Wilkes-Barre hill climb. Paul Lacroix will pin his faith on Maurice Bernin, who has driven in Vanderbilt contests and at Ormond and won for the Renault 24-hour honors at Morris Park. Herbert Lytle, of Vanderbilt Cup fame, who was a winner at Savannah, will be at the wheel of the Apperson Jackrabbit. Montague Roberts, the Thomas Flyer pilot, has had a lot of varied experiences on the track and road, having driven in Vanderbilt Cup elimination trials, won the 24-hour Brighton Beach race, and piloted the New York-Paris Thomas part way across the continent. Emanuel Cedrino, a Vanderbilt Cup and track driver, will man the Fiat, and Arthur Campbell, another contender in the Long Island classic, an Allen-Kingston. Michener and Mulford, the Lozier pilots, were at Savannah, and have been inveterate contestants in the big 24-hour track races. Bergdoll, who won the stock car race at Ormond in record time, will drive his Benz again, unless he decides to surrender the wheel to Parker, his racing expert. W. M. Hilliard, to whom the Hol-Tan Company has entrusted the Shawmut, is a Boston racing expert, who has driven at Ormond, up Mt. Washington, and on various tracks.

Incidents of the Training Have Been Lively.

Racing camps have been pitched at convenient locations around the course. The Lozier, Simplex and Stearns are at Briarcliff; the Maja and Isotta at White Plains; the Thomas and Hol-Tan at East View; the Panhard at Valhalla; the Apperson and Fiat between Hawthorne and Briarcliff.

The candidates have for the most part prudently confined their preliminary practice to a study of the difficulties of the route in touring cars. So bad has been the roadway in places that drivers have actually taken to the ditches to avoid the bad spots.

The early crop of practice disasters has been already quite large. Two were reported to have occurred on Sunday morning. Joseph Seymour, a member of the Simplex team, in rounding a sharp turn near Mt. Kisco, ran into a stone wall, throwing out Seymour and his three companions, R. C. Watson, another Sim-

plex driver, and Phil Fehr and Thomas Carter, mechanics. The front wheels of the car were badly bent.

The same morning David Murphy was putting through its best paces the Maja, entered by Major J. J. Brown, of White Plains, when the car struck a small stone, skidded and was overturned in the ditch. Murphy's arm was badly cut, and the steering rod of the car was broken and its frame bent.

On Saturday, Montague Roberts, while taking a sharp turn in a Thomas Flyer runabout, skidded off the road so sharply that he and his mechanic were thrown out.

The Hol-Tan Company has made an eleventh-hour substitution of a Shawmut for its Hol-Tan. W. M. Hilliard, who will pilot it in the race, drove it down from Boston on Sunday, making the 250 miles over bad roads in 10 hours. The Shawmut is quite a well-known Boston product, having been manufactured by a company at whose head is Elliot C. Lee, former president of the A. A. A. and a prominent banker. Negotiations are in progress for the Hol-Tan Company to add the Shawmut locally to its Hol-Tan line. The Shawmut will be one of the smallest and lowest powered cars in the race, being rated roughly at 40 horsepower, with a piston area of a fraction over 72 cubic inches. Hilliard at once took up his quarters on the course.

The present bad condition of the course, or its probable state on the day of the race, after all promised repairs have been made, not being taken into consideration, the route normally

presents great obstacles to high speed. The curves are practically continuous and sharp turns frequent. In fact, eighteen bad turns to the circuit are admitted by the management. It will be remembered that the sinuosities of the Savannah course, even with the sharp curves well banked, slowed down cars that had shown a 70-mile an hour ability on the straightaways to an average of 50 miles an hour in the race. The Georgia circuit was a race course as compared with the Westchester route. Accordingly, the possible and probable average rate per hour likely to be attained by the Briarcliff candidates becomes a matter for the committee's serious consideration, in view of the fact that the road will be closed against the racing cars at 1 o'clock in the afternoon. The impression prevails that the winner of the Westchester race will be that driver who sets a steady and safe pace and pursues the even tenor of the way without any reference to the perhaps more brash efforts of his competitors.

Start of Race Will Be at 4:45 A.M.

With the start set for 4:45 o'clock in the morning, there will be 8 1-4 hours available for the 300-mile run at present scheduled. This will require an average of 36 1-3 miles an hour to complete the race in time. The fastest single laps in practice so far reported were done in about 50 minutes, an average of 36 miles an hour. There is every hope, though, that by the day of the race the course will be so far improved as to admit of a cut of

five minutes per lap at top speed going. This would give 40 miles an hour average. Unless the course be improved far beyond expectations, it would seem highly improbable that an average speed of 45 miles an hour will be attained. The cars will have to hustle to finish within the time limit, and there is very likely to be more than one weak brother to get the flag before he has finished his entire course.

Order in Which They Will Start.

The drawing for the order of start in the race took place on Tuesday afternoon at the committee's headquarters in the Bryant Park Building. By way of preliminary to the drawing, Robert Lee Morrell, the chairman, outlined a scheme of drawing following the method employed in drawing the positions of the members of the various national teams in the Vanderbilt Cup race, the different makes being given recognition as teams. His idea was that the makes should be separated, to do away with possible team work. This plan would have divided the entrants practically into three divisions.

C. F. Wyckoff, of Wyckoff, Church & Partridge, was on his feet in an instant with a protest, pointing out the fact that this arrangement would insure one Stearns and one Isotta being at the tail end of the procession. At once representatives of other makes were adding their protests and calling for a free-for-all drawing.

The chairman retreated from his position and put the question to vote. The single entries, of course, all liked the Morrell plan, as it would insure them a place in the first fourteen, and the multiple entries just as naturally preferred to take their chances in a general drawing. The Morrell plan was voted down and a free-for-all drawing substituted by a vote of 11 to 8, Mr. La Croix declaring he had no preference and not voting. Bergdoll, the Benz entrant, was absent.

It was subsequently agreed, however, that should two makes be brought together in line the second one should be moved down a place. There was a preliminary drawing for the order of drawing and then came the final drawing, which resulted as follows:

No.	DRIVER.	CAR.	COUNTRY.
1.	Felix Prossen.....	Blanchi.....	Italy
2.	Emanuel Cedrino.....	Flat.....	Italy
3.	Herbert Lytle.....	Apperson.....	America
4.	Louis Strang.....	Isotta.....	Italy
5.	F. W. Leland.....	Stearns.....	America
6.	E. H. Parker.....	Flat.....	Italy
7.	Harry Michener.....	Lozler.....	America
8.	Guy Vaughan.....	Stearns.....	America
9.	Ralph Mulford.....	Lozler.....	America
10.	D. S. Murphy.....	Maja.....	Austria
11.	Al. Poole.....	Isotta.....	Italy
12.	Montague Roberts.....	Thomas.....	America
13.	Barney Oldfield.....	Stearns.....	America
14.	M. G. Bernln.....	Renault.....	France
15.	George Robertson.....	Panhard.....	France
16.	W. M. Hilliard.....	Hol-Tan-Shawmut.....	America
17.	A. C. Campbell.....	Allen-Kingston.....	America
18.	Julian Bloch.....	Renault.....	France
19.	H. N. Harding.....	Isotta.....	Italy
20.	L. J. Bergdoll.....	Benz.....	Germany
21.	M. J. Seymour.....	Simplex.....	America
22.	William Watson.....	Simplex.....	America

The two Simplex cars having drawn positions together at the end a question arose as to what was to be done. The suggestion that one of them be moved to the head of the line was not received with favor and the pair were with universal consent left in *statu quo* at the tail end.

Substantial Prizes Hung Up for Drivers.

With their usual generosity, the tire companies have come forward with substantial rewards for the drivers of cars who finish in the first three places on cars equipped with their tires. The Continental Caoutchouc Company is offering \$650, \$250 and \$100 for the drivers finishing in first, second and third places, respectively, on cars equipped with Continental tires, while the Michelin Tire Company is offering similar

prizes of \$500, \$300 and \$100 for cars equipped with Michelin tires, finishing in the same order. In addition to this, Henry Hess, of the Hess-Bright Manufacturing Company, has deposited a check for \$100 with Chairman Morrell, to be awarded to the driver finishing first with a car equipped with the HB or DWF ball-bearings.

'WARE ABOUT NEW HAVEN.

NEW HAVEN, CONN, April 13.—New Haven these days is a good place for visiting autoists to slow up when passing through, owing to an energetic campaign recently instituted by the police against auto speeders. Measured courses and traps have been prepared all over the city and officers in plain clothes are daily detailed to guard them and time all automobiles passing. Several prominent automobilists have been arrested and heavily fined in the police court. The police activity is the result of a number of flagrant cases of over-speeding and accidents, two of which resulted fatally.

NIAGARA FALLS BOULEVARD.]

BUFFALO, N. Y., April 13.—Every member of the Automobile Club of Buffalo is working industriously for the plans which mean the construction of a boulevard between Niagara Falls and Buffalo. The necessity for such a boulevard is felt by all automobilists. Secretary D. H. Lewis, of the club, is looking after the project, and there is no let-up in his efforts. The fund started at the last automobile show is being increased by subscriptions. Mr. Lewis says of the plan: "That a boulevard is needed between Buffalo and Niagara Falls is conceded, and it is not beyond the pale of possibility that the agitation will bring results before the year passes into history."

G & J CO. LOSES SUIT.

Following upon the adverse decision of the United States Circuit Court last summer in the action brought against the Pennsylvania Rubber Company by the G and J Company, for infringement of its patents on the clincher type of tire, the case was carried to the United States Circuit Court of Appeals for the Third District, which has just handed down a decision affirming in every respect the findings of the lower court. The latter were to the effect that the tire on which the G & J Company claimed the Pennsylvania Rubber Company to be an infringer was not the tire described in its patents, which were the basis of the action, and further that the patents in question described a device which the plaintiffs were not using on their tires, and which, consequently, could not have been infringed.

This, One of the Many Windings, Is Near Hawthorne.

"In regard to tires," says S. F. Edge, "the first thing that struck me in running cars at Brooklands was that a certain degree of inflation was the most important point. All previous instructions from tire manufacturers, and others, who should know, were summed up in the words, pump hard. We, therefore,

This Turn, In the Vicinity of Kensico, Is Particularly Difficult.

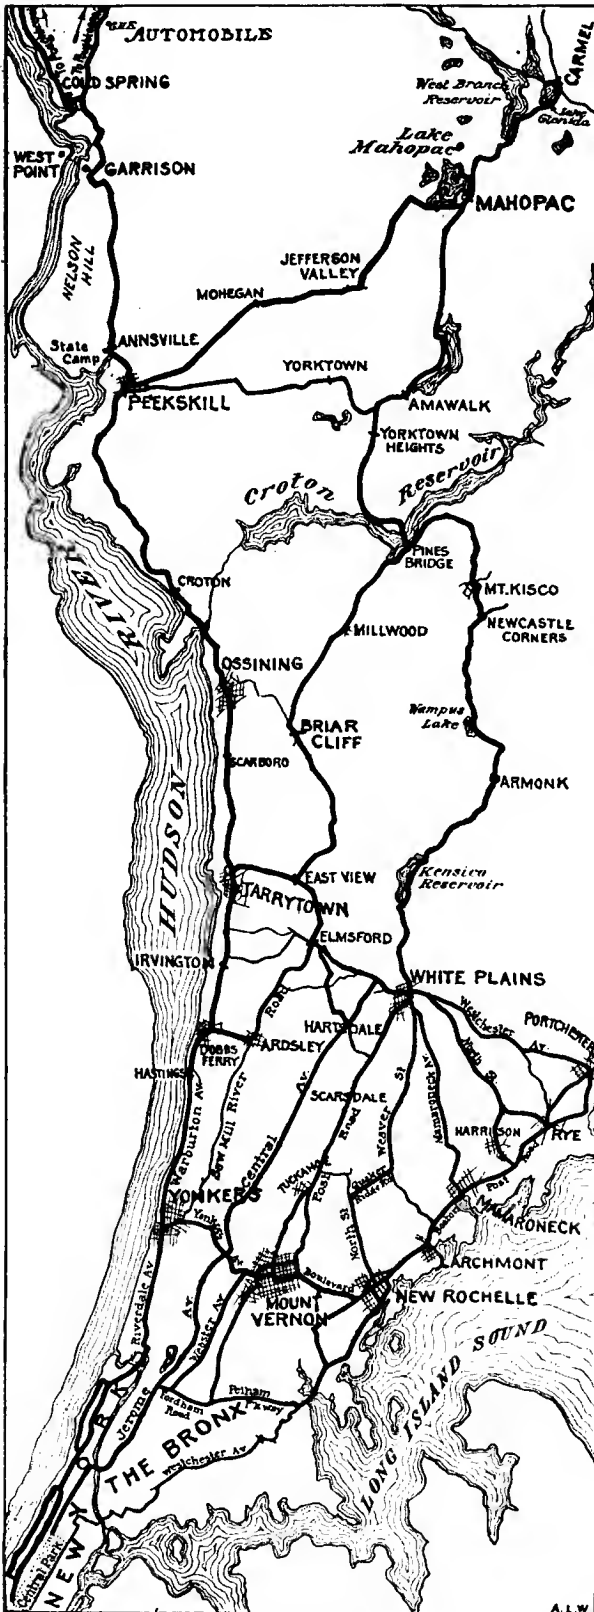

pumped our tires up to the pressure recommended by the tire companies. The result was extreme discomfort at high speeds, owing to the wheels continually leaving the ground; by high speeds, I mean traveling at a rate of 100 miles an hour; in other words, covering the ground at the rate of 146 2-3 feet per second."

Near Mount Kisco, Road Surface Excellent, but Usual Turns Exist.

HOW TO REACH BRIARCLIFF COURSE.

The course in Westchester County for the race follows from the starting point at Briarcliff the main road north-east to Pines Bridge, passing through Millwood and Kitchawan. Turning southeast, it winds down to Mount Kisco, on the Harlem Division of the New York Central, and then runs south through the Wampus Lake section and Armonk,

circling the Kensico Reservoir at Valhalla. From Valhalla, it runs directly west to East View and then north through Hawthorne, returning to the starting point. Briarcliff is on the Putnam Division of the New York Central Railroad. Here will be situated the official grandstand. There will be other stands, though, at East View and above Armonk, Valhalla, Hawthorne, and Mount Kisco. Points on the course can be reached by the Harlem Division trains and East View by trolley from Tarrytown.

NEW YORK TO BRIARCLIFF MANOR, N. Y.—32.3 MILES.

Via Broadway, 155th St., Central Bridge, Jerome Ave. and Central Ave. to Hart's Corners (2 miles below White Plains), thence by the new short-cut road to Elmsford and East View. Good macadam throughout.

This is "The Official Automobile Bluebook" Standard Northbound Route to Points in Westchester County or Beyond Briarcliff Manor.

Columbus Circle—59th St. and Central Park West.

Run up Broadway to 72nd St.; at subway entrance (on left—7-10 M), keep to right of Monument one block on Amsterdam Ave. Turn left on 73rd St. (8-10 M) and 1st right—again up Broadway (closed to northbound vehicles 72nd to 73rd Sts.).

Follow double car-tracks across 110th St. (Cathedral Parkway—2.7 M), downgrade along elevated "subway," crossing Manhattan St. (3.5 M—caution for trolleys and vehicles from right and left.) Ascend grade, direct to 155th St. (upper boundary of Trinity Cemetery—4.8 M); turn 90° right, straight ahead across 155th St. viaduct onto 5.2 Central Bridge. (No toll, but draw frequently open.)

Straight ahead (leaving trolleys to left—5.4 M), into Jerome Ave.; meeting car-tracks from left (5.7 M) follow them across Fordham Road (8.3 M). Continue on Jerome Ave.—several curves, but no turns—crossing (at right angles, just after passing Empire Race-track on right),

13.1 Yonkers Ave.—(About midway between Yonkers and Mt. Vernon.)

The next 7.7 miles (to Hart's Corners) straight macadam—no trolleys or towns of size, but occasional autotraps in the few cross-roads hamlets.

Direct up Central Ave. across Tuckahoe Road (15.6 M), running through Greenville (19.3 M) to Hart's Corners (20.8 M—easily missed at speed, fire station on left, wagon shop on right). Here turn 90° left; 200 feet beyond turn right and immediately left, taking right fork 50 feet beyond, ascending long hill—fine views!

Coming to end of road (21.4 M) turn right, straight ahead through cross-roads (caution for vehicles from right and left), descending—more fine views—to trolley line at foot of hill (23.7 M). Bear left across car-tracks (caution) into the White Plains-Tarrytown road to 4-corners just beyond (immediately before RR).

23.8 Elmsford.—(A notorious autotrapp.)

Turn 90° right, direct 2 3-10 miles to "T" in road at East View (26.1 M—Westchester Co. Alms House on right); again turn 90° right—across concrete bridge (26.9 M), taking left at fork (28.5 M). Thence on main-traveled road running diagonally across Putnam Division, N. Y. C. RR. (dangerous grade—30.7 M); at fork immediately beyond bear right through 4-corners (large stone church on left), at 32.3 Briarcliff Manor—Briarcliff Lodge; Pocantico Lodge (open throughout the year).

NEW YORK TO BRIARCLIFF MANOR, N. Y.—31.9 MILES.

Via Broadway all way across the Harlem River Ship Canal to West 230th St.; thence by West 230th St. and Riverdale Ave. to Yonkers—extended to Dobbs Ferry via Warburton Ave., Yonkers and Hastings-on-Hudson. Turning inland at Dobbs Ferry to the Saw Mill River road, this route reaches Briarcliff Manor via Ardsley and Elmsford. Columbus Circle—59th St. and Central Park West.

Run up Broadway to 72nd St.; at subway entrance (on left—7-10 M), keep to right of Monument one block on Amsterdam Ave. Turn left on 73rd St. (8-10 M) and 1st right—again up Broadway (closed to northbound vehicles 72nd to 73rd Sts.).

Follow double car-tracks across 110th St. (Cathedral Parkway—2.7 M), downgrade along elevated "subway," crossing Manhattan St. (3.5 M—caution for trolleys and ve-

hicles from right and left). Ascend grade, direct to fork (5.5 M just after passing base-ball grounds on left); bear diagonally left with Broadway (St. Nicholas Ave. continues straight ahead), following double car-tracks all way to and under elevated "subway" (8.1 M).

Straight ahead across drawbridge over Harlem River Ship Canal (8.3 M—no toll) to 230th St. (8.6 M—just before left curve of elevated structure). Turn 90° left on 230th St. to end of same at Riverdale Ave. (8.9 M); here turn right, upgrade on macadam. Run direct through Riverdale and Mt. St. Vincent (10.9 M); picking up trolleys (11.3 M) follow tracks to intersection of Main St., 12.8 Yonkers—Riverdale Ave., Main St. and Warburton Ave.

Park Hill Inn; Francfort's Restaurant, both on Broadway, below Getty Sq. Yonkers Auto Station, 71 S. Broadway.

Straight ahead across Main St., into Warburton Ave., past Manor Hall and Monument (on left—12.9 M), following trolley to and over viaduct at Hastings-on-Hudson (16.9 M). Immediately beyond curve left (leaving car-tracks to right) direct on main road to fork just below Dobbs Ferry (18

Map of the Course.

M); here (tablet on right marking Washington's Headquarters, 1781), keep right.

Descend grade (18.5 M), passing stone watering trough in road (18.6 M); at fork immediately beyond (18.7 M—light-colored stone church on left), run nearly straight ahead (road to Irvington and Tarrytown takes left). Thence straight ahead on Ashburton Ave. (macadam), crossing RR. at Ardsley station (19.7 M); at drinking fountain just beyond (19.8 M) bear left into the Saw Mill River road.

Avoiding all right-hand macadam forks (uphill), keep on macadam in valley, direct to trolley line at 4-corners, Elmsford (23.4 M). Continue straight ahead (road from New York via Central Ave. and Hart's Corners comes in from the east and turns right), 2 3-10 miles to "T" in road at East View (25.7 M—Westchester Co. Alms House on right); here turn 90° right across concrete bridge (26.5 M), taking left at fork (28.1 M). Thence on main-traveled road running diagonally across Putnam Division, N. Y. C. RR. (dangerous grade—30.3 M); at fork immediately beyond bear right through 4-corners (large stone church on left), at

31.9 Briarcliff Manor, Briarcliff Lodge.—Pocantico Lodge (open throughout the year).

Paul Cornu's Helicopter Which Recently Scored Fairly Successfully Near Paris.

PARIS, April 5.—For the first time, a *helicoptere* machine, built on a large scale, has been able to raise its motor and mechanic from the ground and fly in the presence of a number of spectators. This is the Paul Cornu apparatus, and recently it raised itself about 1.50 meters from the ground. It consists of a tubular frame stayed by cables. The seat of the aviator is placed at the center, as is also the Antoinette motor. By means of a special transmission using flat belts, the latter operates two large screws, 6 meters in diameter, and fixed at the ends of the frame. The entire machine measures 12 meters in length and is dependent entirely upon these screws for its elevation. The propelling and steering members consist of two planes, mounted at the forward and rear extremities of the apparatus, immediately beneath the screws. By means of a lever, the aviator can regulate the inclination of these planes, as well as the speed and the direction of the flight, ahead or astern. A second lever commands the lateral displacement of the same planes, which

then perform the office of steering and permit the machine to go to the right or left. The weight of the apparatus, including the aviator, is 260 kilos, and it is sustained in the air by the turning of the screws at the rate of 90 revolutions per minute. Propulsion is effected by the reaction of the air thrown by the propellers against the planes. A 24-horsepower motor is employed, but in the course of the trials the best results were obtained when the motor was only delivering 12 horsepower.

The aviation section of the Aero Club of America held a meeting at the club's rooms in New York City on Monday.

It developed into an interesting experience meeting, during the course of which various members had adventures to relate and suggestions to make. Lee S. Burbridge, who recently arrived from Europe, where he investigated the status of aerial navigation in France, argued that progress in the air in this country was hampered by the fact that it was not more generally accepted by the public as an accomplished fact.

In the course of the discussion, Albert C. Triaca, chairman of the committee, Daniel L. Braine, Augustus A. Post, and S. Y. Beach were agreed that what the art in this country demanded was sufficient prizes to attract attention and to insure the efforts of American inventors to the solution of the airship problem. Mr. Triaca prophesied that within two months the Wright brothers, who have a contract to build an airship for the government, would show a flight of 100 miles without stop.

For some time there has been a great deal of confidence expressed by those who claim to know, in upholding this opinion.

A. C. A. ELECTS AND RETIRING PRESIDENT HOYT RECOMMENDS

THE annual meeting of the Automobile Club of America took place Tuesday night at its clubhouse on West Fifty-fourth street, New York City. These officers were elected:

President, E. H. Gary; first vice-president, Henry Sanderson; second vice-president, William G. McAdoo; third vice-president, Robert Lee Morrell; treasurer, Edgar L. Marston; one governor to serve one year, class of 1909, Gen. Horace Porter; three governors to serve three years, class of 1911, Frederick D. Underwood, William Pierson Hamilton, and Waldron Williams; three governors to serve four years, class of 1912, Cornelius Vanderbilt, Colgate Hoyt, and Dr. Schuyler Skaats Wheeler.

In his annual report, Colgate Hoyt, the retiring president, called attention to the fact that he is still of the belief that the A. C. A., and apparently not the American Automobile Association, with its 200 clubs, should be the national organization of the country. The manufacturers of automobiles are told by Mr. Hoyt that they are now sufficiently strong to conduct their own shows, "without our support or assistance, and that the club should now retire from the field."

Attention is called to the successful good roads and good laws conference held by A. A. A. clubs at Springfield, Mass., last September, and which will be repeated in a national manner at Buffalo on the two days preceding the start of the annual A. A. A. tour for the Glidden and Hower trophies. Mr. Hoyt recommends that the A. C. A. organize such a congress, seeming to consider that the Buffalo affair will not be sufficient to answer the needs of the situation. Mr. Hoyt also recommends that there

"be held this spring or summer an international touring car trial, somewhat on the lines of the trial to be held by the Royal Automobile Club of Great Britain, to provide an exhaustive test of touring cars, each car being given a definite rating under a standard formula, and that an exhaustive tire test be held in connection with such trial."

Reference is made to the fostering of inter-club relationship, and the statement is made that an agreement has been reached with the Massachusetts Automobile Club. It is a well-known fact that the A. A. A. clubs throughout the country now have an existing understanding concerning reciprocal courtesies, though Mr. Hoyt ignores this fact.

The statement is made that the A. C. A. declined to endorse the Federal Registration Bill of the A. A. A., on the ground that it is unconstitutional in its provisions. Mr. Hoyt calls attention to the rejection (?) of the bill by the Judiciary Committee of the House of Representatives, though Chairman Jenkins the other day publicly stated that his committee had yet to reach a decision.

Mr. Hoyt mentions the activities of A. R. Shattuck in good road matters. Mr. Niles is also commended for his services.

The total cost of the new clubhouse is placed at about \$800,000, the total mortgage obligations of which is now \$610,000, \$40,000 of the second mortgage bond having been cancelled during the past year with the club's show profits, initiation fees from new members, and fees from life memberships. The present active membership is 1,223, with 30 life members, and 287 associate members. The net gain in membership during the year was 291.

FOREIGNERS DECLINE TO WAIT AND SAIL FOR JAPAN

BY way of reward for having gained sufficient lead to investigate Alaskan conditions before any of its competitors could follow, the Thomas now finds itself a tail-ender, bound back for Seattle on the steamer *Bertha*, while the *Zust* and De Dion crews, who were a fortnight behind it at San Francisco, are on the *Aki-Maru*, bound for Yokohama, Japan. Lieutenant Koepfel, of the Protos crew, who is at Seattle, announces his intention of sailing for Vladivostok with the Thomas, even if necessary to ship the car from Ogden, Utah, where it is now undergoing repairs. This would naturally cost the German car its status as a contestant. The *Zust* crew left Seattle in charge of Heinrich Haaga, the mechanic, Sirtori's frequent differences with the management having caused his contract to be summarily terminated at Seattle. According to R. W. Volmoeller, of the *Zust* Company, who is now in New York, the shipment of the *Zust* with the De Dion was contrary to explicit orders to await the arrival of the Thomas, and to sail with the latter direct to Vladivostok. Mr. Volmoeller declared it was necessary to do this in view of the agreement with the Thomas Company, in anticipation of the possibility of being unable to cross Alaska, due to the thaw.

The Thomas crew received as enthusiastic a reception at Valdez as the entire population of that frontier settlement could possibly provide, and were taken out to Keystone cañon the day after their arrival to investigate conditions. They went as far as Comfort Camp, the first station on the trail to Fairbanks, with the aid of a one-horse sleigh, and tests showed that it would be utterly impossible to proceed over the same route with a heavy car. It was the consensus of opinion that the chances would not be much better, even in winter, and it did not take George Schuester long to make up his mind to return, the Thomas being put aboard the *Bertha*, which sailed the following day on the return trip to Seattle.

According to advices from Seattle, the *Bertha* is due there Friday next, April 17, and the Thomas will be immediately transferred to the steamer *Glenlogan*, leaving on Saturday direct for Vladivostok. With good weather, the passage should not exceed 20 days, so that the Americans should arrive in Siberia on May 7, not more than two or three days after the French and Italian crews, and if the latter should miss connections in Japan, might reach that country before them.

The following statement issued by the E. R. Thomas Company last Saturday, throws an interesting side-light on the matter, the conclusion of which may involve international correspondence:

"The announcement that the Thomas Flyer, America's entry in the New York to Paris race, is returning to Seattle from Alaska, has put the whole outlook of the race in a peculiar light, and one which raises some interesting questions. Perhaps the American car has already won the race without continuing the race to Paris. In the original rules, which were, however, very vague, it stated that should the journey not be continued, the winner would be that car which went the farthest on the original route. This the Thomas has done by going to Alaska, and it is altogether unlikely that any other car will go by way of that country.

"The Thomas car has lost the lead of two weeks which it had on its nearest competitor at San Francisco, through a lot of strategy which was played by the foreigners. Arriving at San Francisco, about a thousand miles ahead of the race, there was no opportunity for any conference nor any decision as to the future course, and it remained for the Thomas car either to await the coming of the other competitors or to start on the route originally planned. No satisfactory direction nor explanation could be received from the officials and committees in charge of the race and, therefore, the car was shipped to Valdez by the steamship *Santa Barbara*. Upon their arrival at Valdez the American crew apparently discovered what people familiar with Alaska had already surmised—that the roads were absolutely impassable—and it remained for them to retrace their course to Seattle. Here they will find the Italian and French cars, and it is altogether probable that the three cars will be shipped direct to Yokohama, continue thence to Vladivostok and by the Central Asiatic route, rather than by the north coast. This will put America's champion again back on an equal footing with its two nearest foreign competitors and within hailing distance of the third. The lead of about a thousand miles, or, reckoned in days, of about two weeks, which it had upon the foreigners at San Francisco, is lost.

The advantage which it would have had by arriving in Alaska on an earlier steamer, is also lost. It now has no advantage over the foreigners, except its reputation, its crew of American experts and the excellence of its American manufacture. On the other hand, it now has an opportunity to win this race for the third time. It has already defeated the entire field by a sufficient margin to prove finally and conclusively that it is the best car for American road conditions and American road travel. Secondly, it has won the race according to the original rules, by going farther over the original course than any of the other competitors. It now remains for the Thomas, starting on an even footing with the foreigners on foreign soil, to demonstrate its superiority over these cars on their soil as conclusively as it did in its own country.

E. R. Thomas Motor Company.

Buffalo, N. Y., April 11, 1908.

MAXWELL WINS A THOUSAND-DOLLAR CROSS-COUNTRY

PITTSBURG, Pa., April 13.—The Maxwell-Reo \$1,000 match race to Philadelphia and back ended this morning in the victory of the Maxwell. C. W. Kelsey and Joe Emerling, its initial and homestretch pilots, arrived here at 9:30 o'clock this morning, having made the round trip of 592 miles in 44 hours. E. L. Seeley and Greenwood, his mate, who manned the Reo, did not reach the finish until 18 hours later.

The match was the outcome of a series of advertising challenges published during the Pittsburgh show. The Reo agent was stirred up by the Pelletier publicity methods, and declared he would "call the Maxwell bluff," so he offered to make an endurance run match to Philadelphia and back for \$500 a side. The Maxwell folks did not like the "bluff" innuendo a little bit, and promptly accepted the challenge. The terms were more quickly arranged than is generally the case in these exchanges of advertising compliments between dealers, and with no superfluous nonsense over conditions beyond the agreement that each car should carry an observer acting for the other, an out and out race was arranged.

The race was started at 1:30 o'clock on Saturday afternoon, the route laid out being in order through Laurel Ridge, Bedford

Springs, Gettysburg, York and Lancaster, much of which was embraced in the course of last year's Glidden tour. The Maxwell arrived at the Bellevue-Stratford in Philadelphia at 11:30 o'clock on Sunday, Kelsey and Emerling having covered the intervening 296 miles in 22 hours. The Reo was over six hours behind, not arriving until 6 o'clock, having been detained by an accident.

The Maxwell at once started on the return trip. Longstreth and Gates, of the Maxwell-Briscoe Philadelphia branch, were its pilots as far as Bedford Springs, where Kelsey and Emerling again manned the car for its run over the homestretch to Pittsburgh. The return run was made in exactly the same time required for the outward bound trip. The first and last 100 miles of the route was rough going up and down hill and through mud. The remaining 400 miles was over macadam most of the way with altogether excellent traveling, the season of the year being considered.

The winning car, which was shod with Ajax tires, had good tire luck, sustaining but five punctures during the long 592 mile run, despite the fact that rough mountain roads had to be traversed for one-third of the distance.

New York's Successful Carnival Means Annual Event

From the Top of Fort George Hill a Magnificent Panorama is Presented of the Country for Miles Around.

"CARNIVAL WEEK," as a formal inauguration of the business season and as a "get up" to the automobilist from his long winter sleep to the realization that spring, with all its joyous saunterings and delightful tours, is at hand, is now assured as an annual fixture on the metropolitan outing calendar. The phenomenal success of last week's New York automobile celebration, backed by triumphs along the same line in Chicago and Indianapolis, makes the spread of the spring carnival idea all over the country by next year more than a mere probability.

As an eyeopener to the extent of automobiling and the magnitude of the motor car industry, New York's carnival was a revelation. A half million people turned out to see Tuesday night's parade. Ten thousand more faced a chilling wind to watch the cars climb Fort George hill on Thursday afternoon. To the practically universal decoration of the hundred or more buildings devoted to New York's trade was added a remarkably widespread decorative emulation by the great hotels and big restaurants along Broadway until an embellishment was attained seldom surpassed even on the occasion of great national celebrations.

And what of results? Just here comes an illustration of the carnival spirit that pervaded the local tradesmen. Their main idea was the success of the carnival as a celebration and demonstration of the sport and industry first, last, and all the time. As a matter of fact, they have been too busy with helping and hurrahing to permit so insignificant a matter as their own personal resultant benefit to intrude upon their discussion of the carnival. They were out to wake up New York; to dispel pessimism; to arouse the public to the permanency and greatness of the automobile rather than to put in six days to pulling purchasers into their sales-rooms. They all had a lot of visitors, gave many demonstrations, and made sales, some more, some less. They are willing to let it go at that. But every one of them believes the much too prevalent pessimism of the past winter has been scattered to the winds and that a harvest will follow, where-in will be reaped a crop in satisfactory proportion to the reduced output of an off year following a financial panic and embracing the business-halting conditions of a presidential election.

The energy and the *esprit de corps* displayed in the promotion of the carnival have been among its most gratifying and encouraging features. "Automobile Row" has proved it pos-

sible to pull together when the common weal has been at stake. Dealers have come to know one another better and to realize what really good, hard-working, honest fellows make up the local trade fraternity. The "Knockers' Club" will now lose many of its members to the "Helping Hand Society."

The committee in charge, with General John T. Cutting, who was at the bottom of the start of the carnival and to whose energy, youthful enthusiasm, and limitless unselfishness much of the success of the carnival is due, at its head, did splendid work, each separate department looking after its own details without a hitch.

Colonel K. C. Pardee, chairman of the hill climb and parade committees; R. G. Howell, grand marshal; Walter R. Lee, secretary of the New York Automobile Trade Association, and C. W. Wurster, who looked after the advertising and publicity, proved able executive heads, but worked no harder and no more efficient than did Percy Owen, Frank Eveland, C. R. Teabolt, C. P. Skinner, R. W. Newton, and Alexander Howell, their associates on the executive and finance committees.

The response of the trade was generous to the call for contributions. Some \$8,500 was subscribed to the general fund. General Cutting says that the raising of \$20,000 next year will be easy. It is planned to make next year's carnival far more elaborate, and have the week not only embrace a parade and hill climb, but racing and other contests as well; in fact, a varied program.

Story of the Fort George Climb.

How great an interest had been aroused, not only among automobilists but also the public at large, in the carnival was attested by the enormous crowd in attendance at the hill climb, which took place on Fort George hill on Thursday afternoon. Every point of vantage at the top and even at the bottom of the grade was occupied by automobiles. The crowd was massed at the start and finish, packed along the curb on either side, and perched upon the rocks on the precipitous hillside. There could not have been far from 10,000 onlookers. The throng was well repaid for facing a stiff wind, more than bordering on the merely chilly, by a series of snappy uphill rushes that kept interest at fever heat from start to finish. The management of the affair and the promptness of the dispatch of the climbers were perfection itself. That 71 cars were started, finished and timed in 109 minutes gives an idea of the efficient handling.

Starting at the Bottom of the Grade.

R. S. CRAWFORD AMERICA'S OLDEST COMPETING DRIVER

The White Steamer, Winner of the Free-For-All, in Full Whistling Cry on Its Upward Journey to the Finishing Point.

Before the Climb Began the Cars Were Lined Up at the Bottom, and Starter Wagner Thus Made His Work the Easier.

Rocks Supplied Uncomfortable Vantage Points.

Packard's Truck Sturdily Made the Climb.

With A. R. Pardington as referee, Fred J. Wagner as starter, and the New York Timers' Club in command of the timing machine, S. M. Butler, C. J. Dieges, Lieutenant P. A. Sayles, and E. LeRoy Pelletier holding the watches, everything moved with the precision of well-oiled machinery.

The enthusiastic co-operation that marked the progress of the whole carnival was in evidence in the response of the dealers to the call for entries, 71 cars actually starting in the 11 events scheduled. The contests were essentially dealers' demonstrations, for with the single exception of the free-for-all, every event was for stock cars and stock cars with every bit of equipment carried at that. The difficulty of the climb was greatly enhanced by a start from an absolute standstill with a run-in of less than 200 feet before the actual climbing began, the time, be it remembered, being taken from the actual start of the car and not from the time of its beginning the ascent. In last year's contest with a flying start, Frank Leland set a record mark of 29 seconds with a six-cylinder Stearns. The estimate of 10 seconds difference to the bad under this spring's conditions as compared with last autumn's was confirmed by that drop in times of the average of the big Stearns brigade. The Fort George hill course, over which the cars were timed, is a 1,900 foot stretch of Belgian block and a finishing stretch of macadam, with an average rise of 11 per cent.

The high speed honors of the climb were carried off by Walter C. White, who captured the free-for-all trophy and also the cup offered for the fastest time, with a score of 32 1-5 seconds. The White steamers gained added laurels by Walter White's putting across the tape a second car in :32 2-5, thus capturing second speed honors as well, and by a stock car of this same make also winning the event for steam machines.

Edgar Apperson proved his Apperson to be the fastest of the gasoline contenders by a record of 36 seconds in the free-for-all. Referee Pardington, by the way, barred this Apperson "Black

Dick," which was said to be a counterpart of the company's Vanderbilt Cup racer of 1906, from the stock car class on the ground that it did not comply with the stock car conditions of the rules.

The best climber in the stock car division evolved in the Stevens-Duryea "Big Six," which, piloted by P. J. Robinson, captured not only the \$3,001 to \$4,000 gasoline event, but the six-cylinder cup as well.

Four-cylinder gasoline stock car supremacy perched upon the banners of the Stearns, Guy Vaughan winning the \$4,000 and over event in 42 1-5 seconds.

A double victory went to the Corbin, J. W. Swan capturing not only the \$2,001 to \$3,000 gasoline climb from the biggest field of the day, but the all-type class with the same price limitations.

The other gasoline events went to a Maxwell in the \$850 and under, a Mitchell in the \$851 to \$1,250, and a Jackson in the \$1,251 to \$2,000 class. H. E. Wagner carried off the electric cup, his Babcock making the ascent in 1:24.

A score of carloads of enthusiasts braved the storm and ploughed through the mud on Friday night to make good the "joy ride" feature of the carnival program, which had Bronxville as its objective point and a dinner at Grammatan Inn as its wind-up. There were 171 tickets sold for the banquet and 125 were on hand at the door with their meal tickets; many, of course, had come by train. At the conclusion of the dinner, General Cutting circled around among the tables and jollied the newspaper boys and others into indisputably impromptu speeches.

Carnival Week wound up with the presentation of the prizes at the vaudeville smoker, given by and at the Automobile Club of America. Following the presentation of the prizes, a surprise was sprung on General Cutting by Col. K. C. Pardee, presenting to him a handsome silver loving cup on behalf of his associates on the carnival committee.

Very Efficient Were the Police Guard.

Referee Pardington and Chairman Thompson.

tion of the touring models. The new Renault has three-quarter elliptic springs in the rear, but otherwise is similar to those in use in New York. One improvement has been made, and this applies equally to all foreign taxicabs, by the cutting away of the driver's double seat and utilizing the space gained for carrying baggage. On the Fiat, additional width is obtained by a leaf folding over the running board. Suitable hangers and a broad strap allow of attaching the trunk in position on the driver's left hand.

Among the British makers there is a strong tendency to get away from the touring car standards and build the taxicabs with the engine forward, but under the driver's seat. A very good example of this is shown in the new Austin cab,

LONDON, April 10.—There is no necessity to visit Olympia to know that the Britisher is intensely interested in the application of motor vehicles to business purposes; a run through the streets of the capital is sufficient. But to realize to what extent the commercial vehicle has taken a hold on the Britisher, the big inartistic Olympia hall at West Kensington should be entered. Right here credit should be given to the Englishman for the preponderating position he has won in the commercial vehicle world. Though working under the disadvantage of a late start, and having his doors wide open to all foreign products, he is fully master of his own market, as is shown by the proportion of British and foreign firms at the second annual commercial vehicle and motor boat exhibition, organized by the Society of Motor Manufacturers and Traders.

America has as her sole representative in the vehicle class a Frayer-Miller truck and engine, shown by the Darwen Automobile Agency, recently appointed sole representatives for the Oscar Lear Company in the British Isles. McCord oilers were handled by an agent, and Goodrich tires occupied a large stand under the name of the British representative. France had as its chief representatives, Renault, Berliet, De Dion, Darracq, Darracq-Serpollet, Georges Richard and Royal. Italy had Fiat; Germany had a couple of representatives; Switzerland one; but the rest—and they were a large majority—were British firms.

Three distinct classes might be formed of the commercial vehicles prominent before the British public. The taxicab, together with the light delivery wagon, the two being one so far as mechanical features are concerned, occupy first position. Large passenger vehicles for service in connection with railroad companies come second in importance, closely followed by gasoline and steam trucks, of from two to ten tons load capacity. This year the motor 'bus is in the minority, probably owing to the fact that in the metropolis, at any rate, the supply has exceeded the demand. Passenger vehicles for other services, however, such as auxiliary railroad work, feeders in connection with surface cars, and observation automobiles in holiday resorts are plentiful. For heavy traction, steam more than holds its own in England, and for vehicles carrying but three ton loads there is keen competition between the two systems.

Taxicabs Are Now the Center of Interest.

In the taxicab field, the French lead in workmanship and the British appear to have the advance in originality. Darracq, Renault and Unic each present a type of cab excellent in workmanship, but which cannot be considered as other than a reduc-

in which the four-cylinder engine in one casting is immediately under the driver's seat, the pedal connections being under the foot-boards and the gasoline tank on the dash. For all ordinary purposes, the engine can easily be reached through side doors, or can be fully accessible by taking down the seat. This disposition of the power plant brings the gear box right under the body of the cab, necessitating the lifting out of the floor boards before it can be reached. The driver's seat is centered and rather higher than usual, owing to it being above the engine. For cab work, the pronounced tendency is toward single ignition by high tension magneto, thermo-syphon water circulation and small compact engines in one casting; in these features the British designers are in harmony with those of the Continent, and it is quite evident that they have been following closely along very similar lines to those adopted by their French and German competitors in the same field of endeavor.

On the Lotus car was employed a 12-18-horsepower two-cylinder "V" engine, also under the driver's feet, with valves, carbureter and ignition occupying the angle formed by the two cylinders. So far as compactness is concerned, the arrangement is an excellent one, the removal of the floor boards uncovering the entire engine, making every part as accessible as it would be on a vertical type. On this car the use of planetary trans-

One of the Latest Types of British Auto Fire Engines.

The Taxicab as Exemplified in the Beeston-Humber.

mission and spur gear differential gave a smack of Americanism, European designers as a rule adopting sliding gear transmission, even for the smallest powers.

Broughams for Commercial Travelers.

A side issue of the taxicab business is the construction of commercial travelers' broughams. Mechanically, this type of vehicle is identical with the taxicab, but in bodywork there is considerable difference. Thus, on the De Dion stand was shown one of these vehicles with a single cylinder ten-horsepower engine and closed body, with only one inside seat, the remaining place being occupied by a series of drawers, cupboards and trays. As English commercial travelers have to operate over big but closely populated areas, in which both trains and street

Unic Taxicab, Another Newcomer at Olympia Show.

cars can be of little service, an economical vehicle of this type should have an immense success.

In the lightest type of delivery vehicles there was a surprising scarcity, in view of the fact that English retail trade is still largely held by small and medium-sized firms having quick deliveries to make. In this class the only vehicle which attracted attention was the Royal, with the entire power plant over the rear axle, leaving nine-tenths of the wheelbase free for bodywork. Single-cylinder engine, gear box and drive were all lodged transversely in the rear of the frame, as accessible when the seat was removed as if on a shop bench; the only part in connection with the engine which was carried forward was the radiator under the front end of the body. Engine control was exclusively by variable exhaust lift.

Delivery by Motor Vehicles Is Booming in England.

For loads of from one to five tons, and still higher, by the use of steam tractors, there is a display at Olympia which proves conclusively that the British merchant is desirous of something more efficient than horse delivery service. The interesting feature about the entire exhibit is that commercial motor manufacturers do not show a chassis only, but series of vehicles completely fitted for different classes of trade. To the business man, the feature is an important one, for, though he is interested in good mechanical construction, he is equally concerned about load capacity, carrying surface and convenient handling. Practically every branch of trade is represented, in many

Auxiliary Railway Auto of Heavy Carrying Capacity.

cases vehicles which have been in use with well-known metropolitan houses being shown loaded up for daily work.

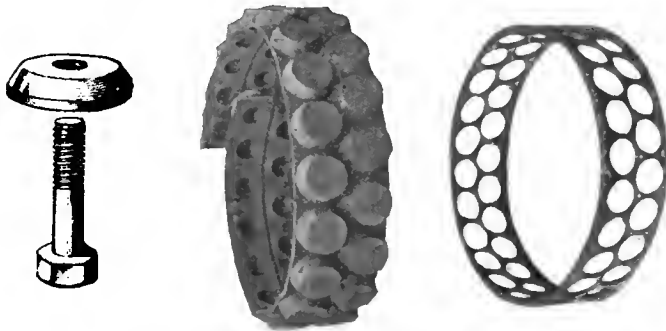

From one to three tons gasoline holds its own, steam being in a decided minority, and electric transmission very feebly represented. Electric trucks are entirely absent; indeed, the only vehicle in the exhibition obtaining its power from storage batteries is an electric bus, representing a line recently put in operation in London. For three-ton loads and above, steam is a serious rival of gasoline, and for the heaviest types of traction, as, for instance, breweries and the building trades, is in a leading position.

Engine design for trucks follows well defined lines in general principles with considerable diversity in details. Excepting the American Frayer-Miller, there are no air-cooled engines, and but few examples of kerosene or alcohol-driven motors. Four-cylinder water-cooled vertical engines, either forward under a bonnet or below the driver's seat, are the standard type. It is in transmission, and especially in final drive, that diversity of design is apparent. Sliding gear, a countershaft and side chains, as in heavy touring car practice, hardly occupies first position in the commercial field. Parenthetically, it may be mentioned that where this type of drive is employed chain cases are always fitted. Cardan shaft, with final drive through rear live axle, strengthened for the heavier work it has to perform, is prominent for the medium weight truck, while worm drive is noted in many cases. Internal spur-gear final drive was noted in a number of cases on the more powerful units.

The commercial steam automobile, being really a development of the traction engine, the construction of which was carried on long before Britain was freed from the red flag law, it was natural that a nation that has always led in steam engine work should turn to the tractor for heavy road work.

Automobiles Compete and Co-operate with Railroads.

For country haulage, for use by market gardeners, millers, brewers, etc., the steam tractor, carrying a load of three, five or

Component Parts of New Cushion Tire for Trucks.

six tons, and capable of taking up to ten tons, by means of trailers, has won a strong position in England. A large number of the manufacturers of these vehicles hail from the coal, iron and woolen manufacturing districts of the North, where steam engineering has always been well developed, and where heavy traction in connection with the varied industries is common. Under the Motor Car Acts, these vehicles are allowed to run at a speed of eight miles an hour with steel tires, and twelve miles an hour with rubber tires. Especially in the Northern manufacturing districts they are now being extensively used, not only as an auxiliary of the railroad, but competitively for journeys of less than forty miles in length.

Owing to their use with and without trailers, and at different legal speeds, provision is made on many of the steam tractors for the convenient changing of road wheels, steel bandages being employed for country work in summer, rubber for town service without trailer, and timber-faced wheels over greasy or frozen roads. A good type of changeable wheel was noticed on a Sentinel steamer, the fixed wheel being one shaped and the dismountable part being shaped to fit over it, attachment being by lugs on the dismountable rim to take bolts passing through holes on a fixed felloe.

A very convenient type of gasoline tank filler was seen on an Arrol-Johnston 'bus chassis. The tank, which was under pressure at the rear, had a projecting pocket 4 inches in diameter by 10 inches deep, fitted with a bucket strainer. Gasoline could thus be poured in without the use of a funnel, and should any of it be spilled there was no danger of it running over the woodwork of the car. With the increase of motor 'buses and taxicabs in the city of London, special police regulations have been brought out to protect against fire, one of them being the carrying of a fire extinguisher on each vehicle.

Payment on Results Is Now Practiced.

Though not a very common practice, it was learned in conversation with exhibitors that several firms supply their vehicles to business houses at a fixed monthly rental covering all costs. The manufacturer undertakes to have the vehicle at the disposal of the customer, in charge of one of his own drivers, for a certain number of hours per day, and to keep it in working condition on the terms stipulated. Though the arrangement is one of limited application, the fact that it is being entered into by reliable firms is conclusive proof of the strong position that the commercial vehicle has attained here.

A new type of cushion tire displayed in the well-fitted accessory section consisted of lengths of rubber with projecting rubber

studs forced into a perforated steel rim, so that the studs will project. The bases of the air spaces are closed by the insertion of steel discs or washers, some of which are tapped to take the screw ends of bolts. The cushion tire thus formed is forced over the felloe of the wheel, a few bolts being passed through the felloe and binding rim into the tapped washers to make all secure.

REPAIRING A CRACKED CYLINDER JACKET.

The accompanying figure shows a cylinder which has been cracked by frost, writes T. W. Holloway in *The Engineer*. Making good such a cylinder jacket may appear to be a very difficult job at first sight, but upon second consideration it will be apparent that there are a number of different ways in which it may be effectively repaired with few facilities. First drill a 1/4-inch hole at the end of the crack shown at A, to prevent it from extending further, then shrink a steel or iron band on the end of the cylinder as shown at B. Then take a chisel about 3/16 to 1/4 inch wide and cut a groove along the line of the crack, making the groove widest at the bottom, as shown at C. Next secure a piece of 1/4-inch copper wire which has been well annealed and hammer it tightly into the groove. By careful calking, a crack of this kind can be made perfectly tight. The copper wire can readily be annealed by heating it and then cooling it suddenly by plunging it into water.

If the crack extends only a short distance as D E, it is not necessary to shrink a band on the jacket, but a hole can be drilled at each end of the crack and the dovetailed groove cut and the copper wire hammered in and calked as previously explained.

Sometimes a short crack is repaired by drilling a series of 1/8 or 3/16-inch holes as close together as practicable for the entire length of the crack, the first and last holes being at the extreme end of the crack, as shown at F G. The holes are then tapped out and cast iron or metal plugs, which are sometimes made for the purpose, are screwed into the holes and cut off even with the surface of the jacket. The job is then completed by rusting in with sal ammoniac.

A very small crack is sometimes rusted up with a saturated solution of sal ammoniac which is poured into the jacket. The solution is then forced into the crack by putting a pressure on the solution. This is sometimes done by means of a tire pump or bicycle pump.

Another method of repairing a short crack consists in applying an iron plate about 1/8 inch thick. Before putting on the plate drill a small hole at each end of the crack, then cut a V-shaped groove along the crack from end to end. Then

Cracked Cylinder Jacket and Suggested Repair.

in the groove put a packing of thin asbestos wick soaked in white lead paste, after which a packing of sheet asbestos the size of the plate and dipped in water is placed over the surface to be covered by the plate. The plate is put on with small screws (about 1/4 inch). The screws should be about 1 inch apart and about 1 inch on each side of the crack. If the jacket is so thin that it is necessary to drill through, then the screw heads should be packed with hemp or asbestos soaked in white lead paste.

SMALL INVENTORS MAKE ANNUAL SHOWING

By W. F. BRADLEY.

PARIS, April 9.—Original and useful ideas of value to the automobile industry are as capable of being produced by humble workers as by persons in outstanding positions, declared a Paris newspaper, and to encourage the introduction of such works it formed a small inventors' exhibition to be held annually.

The fourth event, though more pretentiously installed than its predecessors, is hardly as strong in inventive value, and when the patent collar button, fountain pens, and other automobile novelties have been removed, there is only a small selection.

To prevent a light-fingered gentleman cranking up a car and driving away with it while the owner is temporarily absent has more than once been the object of a competition in France. One invention of this nature shown at the exhibition consists in attaching a locking cage to one of the cross members or side frame and passing through it a squared section of one of the brake connections. When the brake is put hard on a combination keyway on the squared section corresponds with a combination on the locking cage, allowing a pin to be dropped through and turned round so that

New Valve Remover

it cannot be withdrawn unless the combination is known. The principle is one that has been applied with a considerable amount of success to keyless locks. A marked collar above the locking cage allows of several combinations being made.

Allowing an automobile to smoke is an offense in most French towns. To keep drivers out of the hands of the police, therefore, an inventor runs the lubricating oil into a float chamber similar in principle to that of a carbureter. A needle adjustment allows of regulating the height of the float. Thus, only a determined amount of oil can pass through feed to engine.

Two Inventors' Ideas of Mechanical Self Starters.

Mechanical self starters were but two in number. On one a coil spring mechanically wound up by the motor, was contained within a metal casing mounted in the usual position of the starting handle. By the release of a lever on the dashboard, the internal spring was disconnected, allowing the box to revolve rapidly on its shaft and at the same time engage with the forward extension of the crankshaft, thus rapidly turning over the motor. When the engine started up it would overrun the apparatus, then rewind it ready for future use. Owing to the absence of competent attendants, it was impossible to see what device had been adopted to obtain rewinding.

In the second invention a small aluminum case in front of the engine provided two fingers to engage with a steel pin traversing the end of the crankshaft. Normally the fingers were contained on a sleeve within the case and were only brought out to engage with the crankshaft on the drawing over of a side lever, which also, by a reciprocating motion, caused the sleeve and fingers to revolve together, carrying with them the engine. When the motor overran the starter, the fingers only being held out by coil springs were pushed back into their sleeve until withdrawn by placing the lever in neutral position.

Valve removal is simplified by an instrument known as the Palita, which fits one arm over the compression cock or the base of the plug and inserts a lower one with forked end under the base of the valve spring. A few turns of a screw and the lower arm is raised and the valve spring compressed. The device is a

simple one, but is obviously limited to use on an engine with valves in pockets.

A radiator without radiating tubes was formed by a tank divided by horizontal divisions into three distinct compartments. In the top one was contained the hot water coming from the engine; the center one was an air tank, and the lower one received the cooled water by means of a couple of connecting pipes. By means of an air pump driven off the engine shaft by belt and pulley, a strong current of air was sent into the central chamber and through a serpentine pipe passing through the hot water compartment and outletting at the head of the tank.

An air-cooled spark plug sounds anomalous, yet this is what was shown on one stand. The porcelain was baked with a number of holes passing down from the head and coming out immediately above the metal cup of the plug. By thus exposing a greater surface to the air, heat would be more readily carried off and less risk incurred of cracked porcelain.

An extensible pulley for belt transmission on light cars consisted of two pairs of metallic discs mounted on separate shafts, one of each being fixed, the other being keyed so as to give a slight lateral movement. On the inner face of each disc was an extensible pulley formed by six metallic sections, each one of which was connected by an arm passing through a slot in the disc to a sleeve on the pulley shaft. Thus, as the sleeve was pulled towards the disc the segments forming the pulley would be moved farther towards the circumference, forming a larger but broken pulley.

Two Attempts to Improve Heavy Road Wheels.

Though patent road wheels have always been an enticing field for inventors, only two were shown at the exhibition. A solid rubber tire was shod with a series of metal plates or shoes, each one being held by a pin passing through rubber and felloe so as to allow a slight pivoting movement. Each bolt was threaded to allow of regulating the normal pressure on the rubber bandage. Instead of the rubber coming in contact with the road, the chain of metal shoes took the road wear and by their pivoting arrangement allowed compression and expansion of bandage.

A dismountable, extensible road wheel for commercial vehicles, providing for changing of rims, consisted of a forged steel hub with fixed collar, on which were mounted, in the form of a double cone, tangential wooden spokes. Each spoke lodged in a suitable assembling plate on the hub, and in a steel socket on the inner face of the felloe. By screwing up at the hub the

Working Parts of New Type of Shock Absorber.

split felloe was expanded until it bound tightly the steel rim. The hub cap acted as a locking nut and a double wedge inserted in the opening on the felloe prevented further traction.

A very simple type of shock absorber was formed by a circular metallic case containing three projecting rings, one within the other, each one fitted with a leather-faced ring of spring steel. Three projecting studs on the cover of the case engaged progressively between the spring and the crown, thus giving three increasing ranges of compression and resistance as the cover revolves. A pivoting connection linked up the arm of the shock absorber with the spring seating in the usual manner.

LETTERS INTERESTING AND INSTRUCTIVE

ABOUT TESTING THE LUBRICATING OILS.

Editor THE AUTOMOBILE:

[1,307.]—Is there any test by which a good lubricating oil can be differentiated from a bad one, without actually trying them all on my machine? Is there anything in this "Color Test for Carbon" that I have seen advertised? It is claimed that the light-colored oils contain less carbon than dark-colored oils. A. RAFELSON.
New York City.

The chief essentials of a good lubricating oil are freedom from acid, and, where intended to be used in the motor itself, a sufficiently high flash point. To test oil for the first quality, take a piece of bright machinery steel and a short strip of cotton wicking. Soak the latter in the oil to be tested and wrap it around the bright metal. Place it where the sun will shine on it and allow it to remain there for some days. If the oil undergoing the test is absolutely free from acid, there will be no indication of etching on the steel, no matter how long the test may be extended, but even a comparatively small percentage will make its presence known at the end of a week or so.

In order to ascertain the flash point of an oil, heat a sample of it over a Bunsen burner, or on a gas stove, placing a thermometer in it so that the bulb does not come in contact with the wall, or bottom, of the containing vessel. When the oil begins to vaporize, take a lighted taper and pass it back and forth through the vapor. When its flash point is reached, the vapor will ignite in short blue flashes, but it will not continue to burn, nor will the oil itself take fire. The temperature at which this occurs is its flash point, and for automobile cylinder oil it should be quite high. We have never had any experience with the so-called "color test."

ANOTHER WAY OF REPAIRING A JACKET.

Editor THE AUTOMOBILE:

[1,308.]—Being a subscriber to "The Automobile," I write to ask how to repair the water jacket on a gasoline engine cylinder having a portion broken out. I have been told there is a way they are repaired with a piece of copper, without using any bolts or clamps. G. I. THEW.

Osseo, Wis.

The method you refer to is known as "calking," and consists of filling the opening in much the same manner as a seam in a ship is calked. Take a piece of soft copper, preferably copper wire, slightly larger than the crack to be closed, and force it into the latter. The idea is to fill the opening as closely as the original material did, and, as soft copper is very ductile, it may be forced into intimate contact with every variation of the surfaces of the fissure. The opening should be cleaned out first, and, if possible, its interior made slightly larger than at the surface with a file, thus permitting of a rivet fastening, the amount of copper in the crack being greater than that at the opening. A file, hammer and cold chisel are about the only tools required, and as the jacket is not subjected to much pressure, it is not difficult to make a joint that will not leak.

SOLDER AND FLUX FOR ALUMINUM.

Editor THE AUTOMOBILE:

[1,309.]—Please advise me if there is anything for immediate use in the shape of solder for aluminum ware, or if there is a flux that can be used with common solder for this purpose? Will you please let me know if I can obtain this anywhere?

West Liberty, Ia.

LOUIS K. NICHOLS.

There are numerous formulæ for solder and fluxes to be used on aluminum given in various works, but usually they call for the materials not readily procurable in small places, and the method of preparing them is not always possible to the worker with average facilities, so that you will find it much better to buy solder of this kind, which is now on the market. You will find the announcements of manufacturers of aluminum solder in our advertising columns.

IS CAST STEEL A GOOD AXLE MATERIAL?

Editor THE AUTOMOBILE:

[1,310.]—Will you please let me know whether cast steel can be used for the front axles of an automobile, the axles to be cast hollow? Also, whether any manufacturer is at present using cast steel for that purpose. O. M. BOSART.
Indianapolis, Ind.

We hardly think it is a particularly suitable material, whether cast hollow or solid, and do not believe that any American manufacturers are putting out cars with cast-steel front axles. However, as the tensile strength of good cast steel will run as high as 50,000 pounds to the square inch, with an elastic limit of 30,000 pounds, it might do for low-priced and low-powered cars. These are not maximum figures by any means, as cast steel has been produced with a tensile strength as high as 84,000 pounds, and an elongation of 15.6 per cent. It seems, however, that silicon is a requisite to making successful steel castings, and as one of the prime requirements of an automobile axle is "shock ability," or capacity to resist dynamic stresses, great care would have to be taken to keep this element, as well as the phosphorus, as low as possible in order to avoid brittleness. We have heard tales to the effect that motors have been discovered with cast-iron connecting rods, so it is quite possible that cast-steel axles have been employed. Steel castings have been very largely used for heavy marine work. If any of our readers can throw any more light on the subject, we should be pleased to hear from them.

LOOK FOR AN INTERMITTENT SHORT-CIRCUIT.

Editor THE AUTOMOBILE:

[1,311.]—Should the coil vibrate when the terminal is disconnected from the spark plug? On my Reo runabout, when the engine is turned over with the terminal disconnected, the coil vibrates. I can find nothing wrong with the wires. By adjusting the timer so as not to have any vibration with the terminal disconnected, on connecting the terminal without readjusting the timer, there is no spark. The engine seems to run as well as when I first got it, but I do not know whether the ignition system acted in this way originally, or not. W. E. SHARKEY.
Middletown, O.

Judging from the description of the trouble given, there would appear to be an intermittent short-circuit in the timer. That is, it only occurs when the latter gets in a certain position. There may be sufficient strain on the wire leading from the timer to the plug to prevent its occurrence when the two are connected up, and taking the terminal from the plug would relieve this and allow it to make contact. This seems to be the case, in view of the fact that you state the wiring to be in good order throughout. No ignition system should be in this condition. The coil should only vibrate when contact is made at the timer as intended.

ABOUT IMPROVING AN OLD MODEL CAR.

Editor THE AUTOMOBILE:

[1,312.]—Will you kindly give me some advice as to what to do with an automobile? I have a Model A Cadillac, single-cylinder, 10-horsepower car. The compression of the motor is not good. There are three piston rings, and I put on two new rings, the middle one being allowed to remain as it did not appear to be much worn. I noticed that the grooves in the piston were more worn than the rings. The new rings made the compression a little better, but not what it should be. Should I have put on three new rings? Is there anything I can put in the cylinder to improve the compression, yet not interfere with the spark plugs? I use grade A Mobiloil. Is that right for such a motor? I also have trouble with the motor popping some times, when starting. It generally runs all right on low speed, but when I throw the lever into the high speed, the motor starts popping as though the spark advance lever was advanced too much. I am sure the spark is not set too early. I also have trouble with the clutch disk slipping, and am compelled to use rosin, as the leather on the disk becomes smooth. Is that right, or do you know of something

better? The motor makes considerable noise when running in slow speed; apparently in the transmission gear, though an examination showed it to be all right.

R. H. HARRINGTON.

Newcastle, Del.

In replacing the piston rings, three new rings should have been put on. The fact that the grooves show wear is evidence that the motor has been run for a long while after the piston rings had lost their effectiveness. If the use of three new compression rings does not restore matters almost to their normal condition, probably a new piston will be the only remedy. Any other method of increasing the compression could only be a makeshift—that is, such expedients as placing an iron plate on the head of the piston and the like. Examination of the piston may show it to be possible to turn new grooves in it, requiring a slightly wider piston ring, in consequence, and, next to a new piston itself, this is doubtless your best remedy.

Most refiners recommend certain of their brands for use on certain makes and models of cars, and you will seldom go wrong in following their advice. We cannot state definitely whether the brand of oil in question is the best for your car, and, except by making experiments, the only way of finding this out is to apply to the builder of the car. Popping in the carbureter is usually due to a weak mixture which continues burning in the cylinder throughout the exhaust stroke and until the inlet reopens, the escape of the gases still under pressure being responsible for the noise.

We do not find your statement, "popping as though the spark advance lever was advanced too much," entirely clear. Do you mean an actual popping, *i. e.*, like a slight explosion of gas in the open air, or a knock? It would appear to be the latter, from your description, especially when taken in connection with the condition of the other parts of the motor. This would result from a loose big-end, or wrist-pin, bearing, and always makes itself manifest when the load is applied. The fact that it runs fairly well at all times is merely evidence that it is being run under conditions sufficiently favorable to call for but a fraction of the motor's power to propel the car. The noise from the change speed gear is only an indication of its worn condition. The planetary type is far from being noiseless, even at its best, when run on the low speed. There is no remedy that we know of, except a new gear set, which would be an expensive repair. Filling the gearcase with "dope," or heavy grease, may suffice to stifle the noise to a certain extent, but it imposes an added resistance on the gear, and is usually not recommended by manufacturers, though very generally practised by repairmen. Probably the high-speed clutch may need adjustment, bringing its faces closer together, or a new leather facing, or both. Soaking the new leather disc in neatsfoot oil, before applying it, will prevent its drying out and becoming polished, through the lack of proper adjustment is doubtless responsible for the latter, as the leather is only held against the metal with sufficient force to grip when the load is light; the rest of the time it is the same as if it were being pushed against a polishing wheel.

BALANCING A TWO-CYLINDER ENGINE.

Editor THE AUTOMOBILE:

[1,313.]—Will you please inform me if my four-horsepower, two-cylinder engine should be balanced? The piston, wristpin and connecting rod weigh 10 pounds. Would it be just as well to bore four 2-inch holes through the balance wheel to take out 10 pounds? The balance wheel is 3 inches thick. Will the engine run any better if I balance it this way, or is it just as well to let it be the way it is?

H. E. COVILL.

New Bedford, Mass.

By all means, let the engine remain as it is, as the expedient you mention would hardly tend to improve its running any. It is to be presumed that the designer of the engine provided for balancing as well as could be done with the particular type that it happens to be, and there is not only nothing to be gained by attempting such a makeshift as you propose, but it would, in all probability, end by ruining the engine. There certainly does not appear to be anything to be gained by such an expedient.

UNIQUE EXPERIENCE WITH A FRANKLIN.

Editor THE AUTOMOBILE:

[1,314.]—An experience that I had recently in driving my Franklin may be of interest to your readers, as constituting a striking illustration of what an automobile will sometimes go through without suffering anything more than merely nominal damage. I was running over a piece of road that had just been repaired, and was very rough. While going at a pretty good pace my hat blew off, and I made a grab for it instinctively. Just as I did so the front wheel struck a boulder and the right side pair of wheels went into a ditch about 18 inches deep. At the same time a small boy ran out in the road directly in the path of the machine. I made a quick swerve to escape the boy, but as the right side of the car was 18 inches lower than the left, the whole car "turned turtle."

Fortunately for me, I landed on my feet and escaped without so much as a scratch. The engine continued to run undisturbed until I crawled under the car and opened the switch. With the assistance of three boys, ranging from 12 to 15 years old, I righted the car, picked up the cushions and tools, straightened the steering gear a bit, and ran the machine home. The only damage to the car was the bending of the hood, mudguards and the brass spokes of the steering wheel. A few hours' work remedied things.

Dania, Fla.

JOHN W. MULLIKIN.

VALUABLE HINTS FOR FORD OWNERS.

Editor THE AUTOMOBILE:

[1,315.]—Referring to your column "Letters Interesting and Instructive" and to the letter of F. R. Ziegler (No. 1,217), in your March 12 issue, and to No. 1,277, in your issue of March 26, regarding trouble which these gentlemen have experienced with Ford runabouts. The writer had the same difficulty, and the local agent for the Ford assisted me. If the following is of any benefit to these gentlemen, it may be worthy of space in your interesting columns.

The gasoline supply pipe runs near the exhaust pipe for several inches in front of the gasoline tank, in the Ford runabout. After the engine has run for some time the heat from the exhaust pipe becomes sufficient to vaporize the gasoline in the supply pipe before it reaches the carbureter. The trouble is one that is baffling because a short stop is all that is required to permit the cool gasoline from the tank to sufficiently lower the temperature in the small feed pipe to permit liquid gasoline to flow to the carbureter again. Hence, any alteration in the carbureter or ignition or any other part of the car which occupies a few seconds is apparently all that is needed to cause the engine to start again. If these parties will bend the gasoline pipe away from the exhaust pipe and wrap that portion of the exhaust pipe coming nearest the gasoline supply pipe with asbestos, they will probably overcome the difficulty.

PAUL A. DINSMOOR.

Lawrence, Kan.

MR. HAZLETON CITES FACTS AGAINST HIS CRITIC.

Editor THE AUTOMOBILE:

[1,316.]—Referring to Mr. Woolston's statement in the March 26 issue, he thinks 25 pounds of water cannot be vaporized with one pound of kerosene. I made experiments at Nevada and San Francisco, Cal., on both coal and crude oil, and in both cases I could vaporize double the water with oil than I could do with coal. I sold the Atlas Engine Company two 700-horsepower Hazelton boilers, with a guarantee to do 12 pounds with one pound of combustible, and putting the water in boilers from a heater that raised the feed water 2 to 12 degrees, with 100 pounds on boiler. I fulfilled my contract. If kerosene is as valuable as the California crude oil, and it should be better, I can vaporize 25 pounds with one pound of oil. I will use kerosene on my first auto, as I expect to run it to Chicago. Later will try coal.

M. W. HAZELTON.

Oneonta, N. Y.

A HELPFUL SUGGESTION FOR NUMBER 1,218.

Editor THE AUTOMOBILE:

[1,317.]—Have just read letter No. 1,218, and would suggest that the trouble may be in the timer; that is, it may not make contact at the right time. To-day I had trouble very much like this, and while it was not in the timer itself, I found it in the coil—Splitdorf—the connection between the different units being broken and almost every time I started the motor it would fire back through the carbureter.

C. R. HASTINGS.

San Francisco, Cal.

CAMERON ALSO MADE FOR SOUTHERN TREAD.

Editor THE AUTOMOBILE:

[1,318.]—We notice, in one of your late editions, a letter from one of your readers relative to the supplying of a 60-inch tread on cars for use in the South. We wish to state that we supply the 60-inch tread on all of our four models, when specified.

CAMERON CAR COMPANY,

Beverly, Mass.

H. W. Doherty.

COMPARE MAINTENANCE WITH OTHER TRANSPORTATION

BY H. O. SMITH, TREASURER AMERICAN MOTOR CAR MANUFACTURERS' ASSOCIATION

WHAT has been done in automobile manufacturing is only a repetition of history as it relates to other commodities which America has been attracted to and has taken up to develop. The American has proven himself capable of quickly grasping the situation and foreseeing the future possibilities.

It would be difficult to fully realize that from so humble a beginning, and with seemingly so little that is practical to build on, an industry would develop in less than ten years to the enormous proportions of the automobile industry to-day. It promises to continue to expand, and, at the present rate, will in a very few years assume such magnitude that it will be equal to our most important and thriving industries.

A few years ago the belief was general that the automobile would not prove a practical conveyance. One basis on which this opinion seemed to be founded was the fact that our roads had not reached the same standard as European roads, and it was not generally believed that even the most able engineers could design and build a road locomotive to be placed in the hands of inexperienced drivers and used successfully on the roads as we find them, and especially when machinery like that of the railway locomotive was not subjected to rigid expert supervision.

A casual observance of the motor cars in use, supported by the figures, shows that the volume of business done in 1907 represents more than \$100,000,000. This unquestionably proves that the motor car is, and must have been for some time, taken seriously, and that it is no longer considered a luxury or a fad, but is very properly regarded as a practical, economical and dependable conveyance.

A close observer will note that among the standard makes of cars there have been but few radical changes in the last two or three years. It is safe to say that such changes as may characterize the succeeding years' models for some time will be only in the nature of minor changes or improvements and possible body design. It is quite probable that the foremost products of the day will not be considered *passé* several years hence, and for this reason the purchaser of a motor car will not necessarily feel that it is important to sacrifice a car which has seen but one season's service. It is possible for the casual observer in looking over a motor car to appreciate what the automobile of to-day really represents. It is not only a self-contained power plant, refined to a degree of simplicity which makes it possible for those who are inexperienced in mechanics and the handling of machinery to successfully operate a car, but, in addition, the car represents the carrying conveyance itself.

Compare this for a moment with the locomotive which is seldom permitted to travel 200 miles even in the hands of skilled engineers before it is thoroughly inspected and overhauled, notwithstanding the fact that it has not been forced to encounter irregularities in road surface or excessive grades, all of which evidences the fact that careful thought and research are necessarily behind the designing, developing and producing a satisfactory automobile.

It is necessary that a successful builder of motor cars be an able mechanical engineer, but, more than this, he must also be capable of determining necessary sizes and dimensions, and so designing each part as to make it most efficient in service, and of determining those metals which are least affected by the strains and vibrations. It is necessary that anti-fatigue metals be used throughout to avoid the tendency towards crystallization, and, in addition to all these, he must possess a large experience with the motor cars in actual service to best determine the peculiar requirements of the various parts of a motor car when in actual service. We have not only developed the automobile in this country, but we have developed the engineers. The question is often asked: What is the life of the motor car? It would be quite as appropriate to ask how long the engine in a power plant would last. As a matter of course, in either instance the article must be well designed, of proper proportion representing good workmanship and material, and adapted to the service required of it. These requirements being met, the life of the automobile depends upon the care given it. If it is kept properly lubricated and adjusted (which does not mean dismounting and reassembling frequently), the life should be indefinite, except the occasional refitting of certain bearings and minor parts. With actual records of many cars being from 30,000 to 50,000 miles, and all seemingly in good running condition, it is evident that the life of the automobile is not limited.

The future of the motor car depends entirely upon the way it compares with any other means of transportation: first cost, maintenance, and results considered. It is safe to say that a standard well made car of medium size can be driven an average of 30 miles a day, or 900 miles a month, at a cost for fuel, including oil and gasoline, of from fifteen to twenty-five dollars per month. Records can be produced showing that with reasonable care the cost of maintenance, aside from the items mentioned, mishaps, and tire renewals, is from \$25 to \$50 a year. Compare these figures, which are not necessarily the most conservative, with any other means of transportation, and the real worth of an automobile can be obtained.

SEE NO IMMEDIATE FUTURE FOR THE ALCOHOL MOTOR

SYRACUSE, N. Y., April 13.—Extensive experiments have been carried on with the alcohol motor in the laboratories at the Franklin auto factory. The results obtained equal the results obtained in France and also the results obtained by Professor Lucks at Columbia University. The Franklin people, however, conclude that the results do not warrant the belief that there will be an immediate demand for the alcohol motor. But the Franklin people do not consider that they have finished the work and are continuing the experiments. Results to date show that even if alcohol and gasoline could be purchased at the same price per gallon, the gasoline motor would be the more economical. In other words, with the two fuels at the same price it would be cheaper to use gasoline. This is because there is a great deal more energy in a given amount of gasoline than there is in a given amount of alcohol, and up to date there is no way known by which the handicap can be overcome.

There is another very serious drawback to the use of alcohol as against the use of gasoline, say the Franklin experts. The motor can use practically any amount and not suffer. In the gasoline motor, the "mixture" must be right or the motor does not work well. If the gasoline is used too freely and the "mixture" becomes too rich, the operator knows it at once by the loss of power, etc. This is not true with alcohol. For example: If the alcohol motor was running at the rate of three miles to one gallon of alcohol and some little change in the adjustment or conditions caused the alcohol to be fed faster, the motor might consume a gallon to a mile and the operator would not know it. Therefore, under all conditions known to-day the Franklin people conclude that there is no immediate future for the alcohol motor, but they do believe that it is of sufficient importance to merit further experimenting with the possibility that the problem can finally be solved.

THE AUTOMOBILE THAT I DREAM OF THESE DAYS*

By HENRI FARMAN.

SOMEbody asked me the other day if I had completely renounced the automobile, and if I had definitely abandoned the course for the domain of the air. The fact is that the numerous forms of work to which I have to devote myself, the multitudinous and incessant cares which are involved in the con-

struction and surveillance of apparatus, which, it must be admitted, is still in its infancy, have scarcely allowed me time to think of anything else. Flight is a thing so novel, and the sensations that spring from gliding above the surface are so totally different from anything anticipated, that you will readily understand, that any one who has once tried them can hardly think of anything else but a repetition of the experience. But I cannot forget the road course altogether—the scene upon which I made my debut in the world of sport, and which, by a curious coincidence, led me through the very capital of Auvergne, above which we must fly, sooner or later, in order to gain the prize offered—another coincidence—by the generosity of Michelin. I cannot forget that it was in the Paris-Berlin, in the Paris-Vienna, and in the Paris-Madrid, that I acquired the habit of flying that enabled me to maneuver my aeroplane above the drill ground at Issy-les-Molineux. But my already numerous trials have shown me what can be obtained from an aerial propeller. One seldom thinks of the air as a supporting material, and many doubt the assertion that the air is almost as solid as the surface of our roads, when one knows how to make it serve his purposes. However, many interesting experiments have already been made on that subject.

The Wings, Even With Limited Area, Will Decrease the Car's Weight.

struction and surveillance of apparatus, which, it must be admitted, is still in its infancy, have scarcely allowed me time to think of anything else. Flight is a thing so novel, and the sensations that spring from gliding above the surface are so totally different from anything anticipated, that you will readily understand, that any one who has once tried them can hardly think of anything else but a repetition of the experience.

But I cannot forget the road course altogether—the scene upon which I made my debut in the world of sport, and which, by a curious coincidence, led me through the very capital of Auvergne, above which we must fly, sooner or later, in order to gain the prize offered—another coincidence—by the generosity of Michelin. I cannot forget that it was in the Paris-Berlin, in the Paris-Vienna, and in the Paris-Madrid, that I acquired the habit of flying that enabled me to maneuver my aeroplane above the drill ground at Issy-les-Molineux. But my already numerous trials have shown me what can be obtained from an aerial propeller. One seldom thinks of the air as a supporting material, and many doubt the assertion that the air is almost as solid as the surface of our roads, when one knows how to make it serve his purposes. However, many interesting experiments have already been made on that subject.

It will be recalled that as early as 1906, Archdeacon experimented with a motorcycle with an aerial propeller placed forward. That machine, with the screw propeller turned by a 6-horsepower motor, was tried out at Acheres. Driven by Anzani, it attained a speed of 79 kilometers 500 meters an hour, a

*Translated from *La Vie au Grand Air*, by Charles B. Hayward.

speed practically equal to what it would have been capable of had the power been applied to the rear wheels, although the propeller was completely demolished by an accident. On an automobile, the results will be even better, and particularly on bad ground, for then, with the increasing speed it will frequently happen that the wheels will leave the ground and this friction will be eliminated, thus avoiding a serious waste of power. Since the time in question, screw propellers have been perfected. A propeller easily has an efficiency of 50 per cent., delivering half the power of the motor, while the best automobiles scarcely do better than 75 per cent., counting the power delivered at the rear wheels. But that is not their true rating by any means, as account must be taken of the tremendous losses, due to the slipping of the wheels on the road surface,

this being the greatest evil to be contended against in this method of transmitting the power. With a propeller, on the contrary, the transmission is superb, as the effort is constant, while with wheels it is intermittent and jerky.

If, then, I ever return to the road course, it will not be on an ordinary racing car, but one constructed according to the plans which I will outline to you. The car will be composed solely of two axles, the motor, and the screw propeller, the illustrations reproduced here being the result of collaboration with the Voisin brothers. It will have no clutch and no differential. Stripped of all the complications customary on ordinary cars, it will consequently be very light, and should not exceed 400 kilos. With a 50-horsepower motor and a screw propeller 1 meter 80 in diameter, I estimate that it should be capable of at least 150 kilometers an hour. Its form will be very much tapered, in order to diminish the resistance of the air. It will be provided with flat wings, and, even with a reduced area, these wings will be capable, at a speed of 100 kilometers an hour, of relieving the car at least 200 kilos of its weight, so it will be very easy on pneumatics. I have, moreover, a certain criterion to judge by, and that is that my aeroplane, while over the training ground at Issy, is faster than cars of the same power. I thus believe I am right in affirming that my car with its aerial propeller will be faster than a car of any other type, of the same power. Certain it is, that it will be by far the simplest thing on wheels that will have the power to make this speed, and its coming will doubtless make a revolution in racing design.

Area of Aerial Propeller.

This Car, Weighing About 400 Kilos., Should Make 150 Kilometers per Hour.

But will it ever see the light?

CONCERNING THE EARL.

While the expansion of the motor buggy field in the Middle West was having new converts daily through the steadily increasing numbers of friction-driven cars, a new concern, the Earl Motor Car Company, was locating in Kenosha, Ill., and manufacturing on a medium scale friction-driven cars of the two-cylinder type and employing that conventional disc-and-wheel transmission system, although using new methods of engaging these friction members. The car then marketed was a 16-horsepower design with an opposed motor in front and the transmission located midway between the motor and rear axle, permitting of the use of reasonably short side chains for transmitting to the rear wheel. Since then the company has climbed one round higher in the ladder of automobile manufacture by bringing out a larger 20-horsepower two-cylinder car and a four-cylinder roadster for the present season, the manufacture of

Rear View of Chassis of Earl Friction Drive Car.

Detailed Outline Sketch of Earl Friction Drive Mechanism.

which now occupies the major energies of the Kenosha plant. The style of transmission used in the two and four-cylinder cars is alike and central picture illustrates its general design. At the rear face of the flywheel is a universal joint, and a longitudinal driveshaft, which at its forward end is a sliding fit within this joint, carries on its rear end the radially-ribbed friction disc shown in the illustration and which contacts with sliding friction wheel of the regulation type on a rigid cross-shaft. The friction disc with its longitudinal shaft slides endwise for engagement with the friction wheel and disengagement therefrom, but the novelty in connection with this is that a heavy helical spring keeps the disc constantly pressed against the friction wheel, the same as a clutch spring keeps the clutch engaged except when released by the driver by pressure on the clutch pedal. Should this spring, due to any cause, not give sufficient contact between the disc and wheel, pressure on a pedal may be used to augment such engagement. The reader will at once recognize the difference between this friction scheme of constant engagement and that generally used; the general scheme being to keep the disc and wheel separated normally and bring them together by ratchet retained pedal, thereby depending solely on mechanical means for engagement.

In disengaging the disc and wheel, the control, consisting of the ratchet-retained

pedal, whose connections are illustrated herewith, is used, and by means of which the disc is locked by the ratchet in its disengaged position, the coil spring at this time being under greater compression. Should, however, the spring not give sufficient engagement then the left pedal is used to assist in forcing the disc against the wheel to increase the pressure.

The much talked of slip between the disc and wheel is not looked upon as sufficient excuse for a differential, and consequently fitted to the right end of the cross-shaft is a spur-gear differential.

Conspicuous in the running-gear of the Earl roadster is the employment of a wooden chassis frame, the sills being reinforced by steel plates 3 1-2 inches wide and taken from 3-16-inch stock. Spring suspension throughout is by full elliptics, the driving strain of the rear axle being absorbed by a pair of turn buckle radius rods, extending between the axle and the jackshaft. Braking effort rests with a pair of band brakes on the rear wheel, to which can be added the action of the friction-driven reverse when occasion demands it.

Used in this car is a 22-horsepower Waukesha motor, characterized by 4 by 4-inch cylinders, both sets of valves carried in chambers on the left side, a jump spark ignition with one set of plugs carried, not in the valve caps, but in the angle between the intake and cross valve and the cylinder dome. Cooling and lubrication are patterned after the regulation types endorsed by standard engineering practice, and in fact this is true of the remainder of the car.

Earl Four-cylinder Roadster—a Newcomer This Season.

The Array of Jerusalem's Denizens that Greeted Mr. and Mrs. Charles J. Glidden, on March 13, on Their Arrival at David's Tower, Jaffa Gate.

THE GLIDDENS IN THE HOLY LAND.

Hitherto the official successors of Mahomet have positively declined to issue firmans permitting an automobile to traverse the Holy Land, and it remained for Globe Girdler Charles J. Glidden to so ingratiate himself into the Sultan's favor that he was the first automobilist to be honored with the official permit. As noted in THE AUTOMOBILE of April 2, Mr. and Mrs. Glidden landed their car at Haifa, going thence to Jaffa and Jerusalem. Later advices state that they have completed the tour of the Holy Land, driving in all a total of 500 miles in that world-famed region.

Their arrival at the Jaffa gate of the Holy City was the signal for much excitement among the natives. A great crowd collected to bid them welcome, and foremost among those to extend greetings were the American Consul, the Hon. T. R. Wallace, and Mrs. Wallace, who, with their young son, are seated in the car with Mr. and Mrs. Glidden, in the photograph on the opposite page. After leaving Jerusalem the tourists proceeded to Hebron, thence to Jericho, and along the River Jordan to the Dead Sea, and returning visited the Mount of Olives, and thence to the port of Haifa, via Nablus.

According to Mr. Glidden a carriage with high clearance is necessary to successfully negotiate the roads of the Holy Land, which are stony and sometimes have muddy grades up to twenty per cent. His total world's tour mileage up to March 19 is 43,367 in thirty-seven countries traveled, and he has been on the road a total of 350 days.

NANTUCKET'S FIGHT TO BE AUTOLESS.

BOSTON, April 11.—The island-county-town of Nantucket, in Massachusetts, which has waged war on the automobile ever since that type of vehicle became sufficiently perfected to venture so far at sea as Nantucket, has scored an important point in its campaign of exclusion. A week ago the island authorities invited the legislative committee on Roads and Bridges to visit the island and look over the possibilities of the use of its narrow, cobble-paved town streets, and its one good piece of State road for automobiles. The committee spent a day or so at the island, and when it returned was so well satisfied with what it saw that it has reported a bill exempting Nantucket from the working of the general automobile law for three months of the year.

For several years Nantucket has tried to exclude automobiles under the general law, but it has not been altogether successful and automobiles have actually invaded the streets held sacred during the summer boarder season to the livery stable surrey. Under the bill reported this week, however, it is provided that the part of the law which permits of review of local regulations by the Highway Commission shall not apply to Nantucket from June 15 to September 15. As this is the only time anybody wants to go to Nantucket the bill amounts to exclusion.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- Apr. 21-23.....—Louisville, Ky., New Coliseum, Automobile Show. Hubert Levy, manager.
- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
- January, 1909...—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
- February, 1909.—Chicago, Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Race Meets, Hill Climbs, Etc.

- Apr. 24.....—Briarcliff Trophy Race, Westchester County, N. Y. Robert L. Morrell, chairman.
- Apr. 28.....—Norristown, Pa., 125-mile Endurance Run, via Lancaster and Reading, Norristown Automobile Club.
- May 4-5.....—Harrisburg-Philadelphia and Return, 300-mile Endurance Run, Motor Club of Harrisburg.
- May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
- May 16.....—Hartford, Conn., 200-mile Endurance Run, Automobile Club of Hartford.
- May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
- May 30.....—Wilkes-Barre, Pa., Giant's Despair Hill Climb, Automobile Club of Wilkes-Barre.
- May 30.....—San Francisco, Endurance Run under the auspices of the Automobile Dealers' Association.
- June 6.....—Worcester, Mass., Dead Horse Hill Climb, Worcester Automobile Club.
- June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
- July 7-8.....—Buffalo, N. Y. National Convention of the American Automobile Association.
- July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
- Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, under the auspices of the Automobile Dealers' Association of San Francisco.
- Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- May 17-31.....—Austria, Budapest Automobile Show.
- May 17-June 2...—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
- December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- Apr. 25-May 25.—Industrial Vehicle Competition, Automobile Club of France.
- May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
- May 7.....—Sicily, Palermo, Targa Florio Circuit, Voiturette Race, Automobile Club of Italy.
- May 11-16.....—Ireland, Irish Reliability Trials.
- May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
- May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
- May 31.....—Russia, St. Petersburg to Moscow Race.
- June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
- June 14.....—Mount Cenlis Hill Climb, for Voiturettes.
- June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club.
- June 15-19.....—Scotland, Scottish Reliability Trials.
- July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France).
- July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
- July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
- July 20-30.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
- Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
- Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclusien Automobile Club.

THE FIRST 1908 BLUE BOOK.

This week the Class Journal Company, publishers of THE AUTOMOBILE and MOTOR AGE, bring out the first of the 1908 series of "The Official Automobile Blue Book," carrying forward by a second full year the work first undertaken on broad and permanent lines in the compilation and publication of the one-volume edition of 1906.

While covering practically the same territory as the corresponding 1907 volume, approximately one-half of the entire territory has been written new from personal observations with odometer measurements—a wider sweep of the country than was ever before attempted to cover by this means.

There are 292 separate routes in the book, totaling 19,135 miles. Of the 313 maps, 133 are route maps, principally in the margins of the pages; 137 city maps, with 35 full-page maps. There are, in addition, three double-page maps, whose six pages cover the territory in general from the Hudson River, Long Island Sound and Lake Champlain to the Rhode Island-Massachusetts Coast, the upper Maine border and the Canadian line. By the aid of these maps and the index (both of places and of trunk lines, the latter being a framework by which separate runs are listed consecutively as through routes), a tourist is able to find his way with a convenience and certainty never before approximated, practically throughout New England.

As an example of the thorough character of the present work, it may be cited that one is able to plan a round trip to and from the White Mountains from New York by three different trunk-line routes, complete connections to and from which are easily made by the regular routes of the different sections from practically any point in New England. The highest point reached by the matter compiled new for the 1908 edition is Dixville Notch, N. H., this route skirting the upper Connecticut River Valley to Colebrook, crossing over through Dixville Notch to Errol on the N. H.-Me. border, thence down the Androscoggin Valley to Gorham and the White Mountains.

The important stretch between the White Mountains and Portsmouth was written new from personal observation for the first time, with odometer mileages throughout, and many another stretch that has heretofore been traveled with uncertainty, if not with actual difficulty, has been made plain by this latest edition, the number of whose pages have been increased over 200 to accommodate the additional material.

The Blue books are again brought out under the exclusive official endorsement of the American Automobile Association. The New York State volume is now entirely in press, and will shortly be issued, followed by Volume No. 3, dealing with New Jersey, Pennsylvania, the South, and the West. There is shortly to be an addition of a fourth volume, covering the Middle West, announcement of which will soon be made.

The extension of routes to and from the Middle West evidences both the rapidly broadening field of the Blue books and the growth of touring in that territory. A separate volume, published by the Class Journal Company, is the "Metropolitan Automobile Guide," comprising 74 separate round trips to and from New York and Brooklyn, ignoring the State lines and other divisions that necessarily exist in a work as large as the Blue books.

A striking example of the past and present was accorded Hartford, Conn., voters at the recent city election. It has always been the custom in Hartford, as in other cities, to round up delinquents at the polls, and for this purpose horse-drawn vehicles have been used. This season, however, there was hardly a horse outfit to be seen, and the automobile had things pretty much its own way. Every dealer in the city rented all his spare cars, and these were at a premium. Both candidates made their campaign speeches in autos. One owner of a commercial car fitted up the vehicle with side seats and brought the voters from the factory districts by the dozen or more. Of course, the livery men, that is, those who do not use autos, are sore all through.

REVISED AND COMPREHENSIVE OFFICIAL AUTOMOBILE BLUE BOOK CHART OF AUTOMOBILE LAWS ENFORCED AND IN EFFECT UP TO APRIL 15, 1908. When travelling in "exempt" States, automobilists should display home license numbers and tags. When travelling in non-exempt States remove number and tags of home and other States.

	Registration with	Fees	Numbers	Lamps	Non-Residents	Speeds
CONN.	Secretary of State Hartford.	Annual registration of car. Less than 20 H. P., \$3.00; 20-30 H. P., \$5.00; 30 H. P. up, \$10.00. Operator's license (annual) \$2.00.	Must be obtained from Secretary of State—\$1.00 for set of two	Front and rear lights required	Exempt 10 successive days, but home-State number must be carried.	Must not exceed 25 miles per hour, "or at a rate of speed greater than is reasonable and proper"
DEL.	Secretary of State. Dover.	\$3 for registration, \$2 for driver's license, both annually on January 1st.	5 in. high, front and rear, with year and initials of State.	1 white forward; 1 white rear illuminating number; 1 red rear.	Exempt 10 days a year.	10 m. curves and intersections; 12 m. cities and towns; 20 m. elsewhere. Chains prohibited except on dirt roads.
D. C.	The Automobile Board. Washington.	None, but license to operate required	3 in. rear; initials "D. C." 1 in. high.	2 forward at sides, and 1 rear showing red and white.	Exempt 60 days; but non-residents must register with the Automobile Board within 24 hours.	Fire limits, 12 m.; 15 m. parks; 8 m. across streets; 6 m. corners; 4 m. certain designated streets and corners; 20 m. outside fire limits; 12 m. meeting and passing vehicles
ILLINOIS.	Secretary of State. Springfield	\$2.00; professional chauffeur \$1.00	Front and rear 4 in. high; letters "ILL" 1 in. high, black on white ground.	2 in front with Nos thereon 1 in. high; 1 red rear.	Exempt so far as State is concerned.	15 m. outskirts; 10 m. built-up section; 6 m. corners and crossings; 20 m. elsewhere.
INDIANA	Secretary of State. Indianapolis.	\$1.00.	4 in. front and rear, 1st 3 letters of State, 4 in. high; white on black.	"Shall carry lighted lamps."	Exempt.	8 m. closely built portions, 15 m. other portions; 20 m. outside
KY.	No State provision. Local authorities should be consulted.	No State provision.	No State provision.	1 white front, 1 red rear.	Exempt so far as State is concerned.	6 m. crossings, bridges, curves and descents; 15 m. elsewhere
MAINE	Secretary of State. Augusta.	\$2.00 registration; \$2.00 license. Both indefinitely	Supplied by State.	1, location and color not specified.	Exempt	8 m. cities, towns, etc. 15 m. elsewhere; prohibited certain roads, Bluefield, Camden, Mt Desert, Readfield, Eden, Castine.
MD	Secretary of State. Annapolis.	Owners \$3.00; chauffeurs \$2.00. Perpetual; owner needs no driving license.	3 in. high front and rear, white on black background, 1/4 in. wide. Remove all other tags.	2 white front, with number 2 in. high; 1 red rear.	Not exempt	6 m. sharp curves, intersections of prominent cross-roads; built up portion of city; elsewhere, 12 m.
MASS	Highway Commission. Boston	\$5.00 registration, annually. \$2.00 private operating license, perpetual. \$2.00 pro. chauffeur's license, good year from date.	Front and rear. Plates furnished free	1 white each side front, containing numbers 1 in. high.	Exempt 7 successive days	12 m. cities; 20 m. country; 8 m. curves and intersections.
MICH.	Secretary of State. Lansing	\$1.00; 50c. renewal. Same for chauffeur. Both good year from date.	Front and rear, 3 in. high, with State abbreviation 1 in. high; black on white or vice versa.	2 white front, 1 red rear	Exempt if home State grants reciprocity	8 m. business portions, 15 m. other portions; 25 m. outside.
MO.	Secretary of State. Jefferson City.	\$5.00 owner; \$2.00 chauffeur.	Front and rear 3 in. with "Mo." 1 1/2 in.; white on black.	2 white front; 1 red rear.	Exempt.	Business portion cities or villages 8 m.; elsewhere 15 m. Corners and crossings 6 m.
N. B. Canada.	Secretary of Public Works. Fredericton	Registration \$5.00; renewal \$1.00; chauffeur \$2.00.	Tag in rear, numbers 3 in. high, black on white. Letters "N. B." 1 in. high.	1 white light front showing numbers 1 in. high.	Not exempt.	Built-up sections 7 1/2 m.; elsewhere in town or city 12 m.; 15 m. open country; 4 m. bridges, curves, descents and crossings.
N. H.	Secretary of State. Concord.	Registration \$3.00, perpetual \$1.00 for yearly operator's license annually. Chauffeur's \$5.00 annually	Front and rear, supplied by State.	2 containing number not less than 1 in. high.	Exempt	8 m. business districts, compactly built sections of cities or towns; elsewhere 20 m.
N. J.	Commissioner of Motor Vehicles, Trenton, or Deputies, of which there are several in the State and two in New York City.	Registration \$3.00 for under 30 H. P., \$5.00 for 30 H. P. or more. License fee \$1.00 under 30 H. P.; \$2.00 above; good one year from date	Front and rear 15 in. and not more than 16 in. above ground. Must be 4 in. high and 3 1/2 in. wide, with letters of State same dimensions.	2 white front, showing numbers 1 in. high; 1 red rear.	Not exempt.	1 m. 7 min. curves; 1 m. 4 min. intersections or within 200 ft. of horses or animals upon highway; 1 m. 5 min. built-up portions of city, town or village; elsewhere 1 m. 3 min. Chains prohibited on macadam, unless 2 in. ice or snow
N. Y.	Secretary of State. Albany	\$2.00 owners, chauffeurs, manufacturers, 50c for manufacturer's duplicate. Good for all time. (Owners do not need driver's license.)	Rear 3 in. high, with initial letters of State not less than 1 in. high	2 white forward, with number not less than 1 in. high; 1 red rear.	Exempt.	10 m. business and built-up portions; 15 m. where houses average less than 100 ft. apart; 20 m. country; 4 m. curves, bridges and steep descents
OHIO (Old Law).	No State provision. Local authorities should be consulted.	No State provision.	No State provision.	1 or more white, front; 1 red, rear.	Exempt so far as State is concerned,	8 m. business and closely built up portions of municipality; 15 m. other portions; 20 m. elsewhere.
OHIO (New Law) Not yet in operation because de clared unconstitutional.	Secretary of State. Columbus	Owner's registration, \$5.00 under 30 H.P.; \$3.00 each additional 10 H.P. Owner's license, \$5.00 30 H.P. or less, \$3.00 each additional 10 H.P. Chauffeur's, \$2.00.	Rear, white on black ground, 4 in. high and 1/2 in. wide, with letters "OH." 4 in. high	2 white front, showing numbers 1 in. high and 1/2 in. wide; 1 red rear.	Exempt	10 m. built-up portions of city, elsewhere in city 15 m.; elsewhere 20 m.; approaching bridges, dams, sharp curves or descents. 4 m.
ONTARIO, Canada.	Provincial Secretary. Ottawa.	\$4.00 for first year, \$2.00 for each renewal. Good calendar year	Front and rear; plates free.	2 2 in. high; 1 rear illuminating number. Search lights not allowed.	Not exempt.	Cities, towns and villages 10 m.; outside 15 m.
PENNA.	State Highway Department. Harrisburg.	\$3.00 for driver's license, yearly renewal Jan. 1. Registration of car unnecessary, but driver's license must be affixed.	5 in. high, front and rear. Tags supplied free; remove all other tags	At least 1 white front and 1 red rear, showing number	Not exempt, except from municipal license in Philadelphia 48 hours.	10 m. cities and boroughs; elsewhere 20 m.
QUEBEC, Canada.	Comptroller Provincial Revenue. Quebec, or Agents	\$5.00 registration. Owners and chauffeurs license \$5.00. Expires April 1st each year	4 in. high, 1 in. wide, front and rear, with "Quebec" same size underneath.	2 white forward, showing number 1 in. high; 1 red rear. Searchlights not allowed	Non-resident Canadians exempt; others must register	Towns and municipalities governed by Municipal Code, 9 m.; 15 m. elsewhere, 2 m. sharp curves, bridges, steep descents, intersections and crossings
R. I.	Secretary of State. Providence.	\$2.00 owners; \$10.00 manufacturers and dealers.	3 in. high rear	Such as Secretary of State approves.	Exempt.	No State provision, but local authorities should be consulted
VERMONT	Secretary of State. Montpelier	20 H.P. or less, \$3.00 more than 20 H.P., \$5.00 \$2.00 operating license both perpetual. Chauffeurs \$2.00 annually	Front and rear supplied by State	2 white front showing nos, 1 red rear illuminating nos	Exempt if registered in a home State granting reciprocity	10 m. cities, villages, 25 m. outside
*VIRGINIA (New Law.)	Secretary of State. Richmond.	\$2.00. Postage on plate 15 cents.	Rear; supplied by State	At least 1 white forward, and 1 red rear, illuminating number.	Not exempt.	6 m. curves, intersections; 10 m. built-up portions of cities, villages or where there is a gathering of persons or horses; elsewhere 15 m.
WEST VIRGINIA.	State Auditor, Charleston	\$10.00. Good May 1 to April 30.	Front and rear, supplied by State.	No provision.	Not exempt.	No State provision. See local authorities

*VIRGINIA. The new law of Virginia is only applicable in those counties adopting; the act. Most of the counties have adopted the law

The State of New Jersey has just adopted a number of changes in its automobile law which will go into effect June 1, 1908. (For details see page 544.)

WHEREIN SPEED WILL BE A MINOR FACTOR.

It is a more or less general consensus of opinion that those who look for speed in the coming Briarcliff race will be greatly disappointed. Then, why the race? ask many, for what is a race without speed? This, in brief, may be put down as representing the views of a large number whose chief desire is to see speed, and then more of it, and who look back upon a race merely as a milestone that marks some new achievement in record-making. Racing naturally involves competition, and the maximum speed that the competitors can get out of their machines, otherwise it would not conform to the name. But the mere fact that the maximum speed made does not form a close approach to existing records, or better them, is certainly no reason for prejudging the event as one of little value, as the speed enthusiasts have done.

Practical autoists, on the other hand, regard the event as one that will prove the ability of a car to stand the most gruelling test to which an automobile could possibly be put. The marvel will not be that the cars will be unable to break existing speed marks, but that it will be possible to drive them at anything more than an ordinary rate of travel over such a corkscrew course. It is, in fact, a test of their "rough-ability," and the honors will doubtless go to those that can stand the pounding and can still keep going, rather than those capable of high speed under favorable conditions. And the driver will be a factor fully as important as the car itself. Viewed in this light, the Briarcliff race should prove of

value, as it is an already well-established fact that the auto can go much faster than it is safe to drive it.

WHY NOT AN AUTOMOBILE MUSEUM?

Progress in automobile building has been so astoundingly rapid that the machine of a decade ago compares with its present-day successors much the same as the first locomotive of Stephenson does with those of the present. The progress that it required almost a century to compass in the latter field of endeavor has been condensed into less than ten years in the case of the automobile, so that it would seem fitting that steps be taken without further delay, to preserve the prototypes of the power-driven road vehicle in the manner accorded the locomotives of bygone generations.

In other words, is it not time that an automobile museum were established to afford an honored resting place for those early American representatives of the automobile with which inventors struggled to make the modern vehicle possible? Things move so fast nowadays that, within a few years, it is doubtful if many of these first cars will still be in existence. They are antiques only as gauged by the measure of progress that separates them from the automobile of to-day, so that they are not hallowed by the three-score years or more of service that caused old locomotives to be treasured, but judging from the viewpoint of advance alone, they are equally venerable and should not be allowed to find their way to the junk-heap unhonored. The National Museum houses most of the early American locomotives and it already has an automobile exhibit or two. It seems fitting that it should have an automobile section wherein may be gathered to rest all that remains of pioneer attempts in this field on this side of the Atlantic.

A SIDE LIGHT ON THE NEW YORK-PARIS RUN.

It is quite apparent from the contribution of our Paris correspondent last week, that the French manufacturers' plans in supporting the round-the-world race have sadly miscarried. It was confidently expected that the triumphal passage of several French cars across the United States would be exactly the thing that was required to demonstrate the overwhelming superiority of the foreign product, thus bringing before the population of a country that has bought more French automobiles than any other outside of England the fact that they were still immeasurably better than anything that could be turned out here, regardless of the great advances made in recent years. Government reports have it that French exports of automobiles to this country have been on the decline during the past few years, just as they are to other countries, but the United States constitutes a market not to be relinquished without a struggle, so that doubtless this most daring feat, engineered by two newspapers for publicity purposes, did present a much-sought opportunity. But alas for the triumphal progress! Gone forever, and with it one of the greatest opportunities for the French maker to shout *Vive la France!* There is still Siberia. Bah! says monsieur, disgustedly. Mongols and Tartars do not buy cars, French or American. Who cares what happens to the cars there? Wait: for the Grand Prix. We will show them.

CHICAGOANS WILL TRY A NEW FORM OF HILL-CLIMB

CHICAGO, April 13.—Chicago is so accustomed to setting the pace in the way of framing up original motor competitions that the townspeople are not at all surprised by the originality shown in the program arranged for the third annual hill-climb at Algonquin, Ill., drafted by the Chicago Motor Club, which were announced this week. In the first place, Chicago is the only promoting city in the country to hold a double climb, one from a standing start in the morning and the other from a flying start in the afternoon, two hills being used but both figuring in the final reckoning. It was the first to adopt the handicap formula which has proven so successful and all the way through it has shown originality far above the ordinary.

The fundamental principles of the previous climbs are retained in the rules just announced, but the technical committee, which is responsible for the conditions, has broadened the scheme until now it looks to be as near ideal as it is possible to arrange climbs. The handicap formula will be retained, and there will be four classes in this division, classified according to piston displacement. Then there are four other events which are free-for-alls, in which straight time will be the deciding factor, this part of the program being arranged to meet the demand of some of the dealers who assert the public cannot understand the handicap formula. Then there is a segregation of motor buggies which are put in a class by themselves, while the amateur driver will be given a chance to show his ability in two events, one a handicap and the other a free-for-all. The club has adopted the A. A. A. definition of an amateur, and will see that no wolf in sheep's clothing creeps in. Another feature of the card is a team competition. This will not be separate, however, the three cars of one make with the best percentage showing being declared the winner.

The handicap formula which will decide the winners in those events consists of multiplying the cylinder capacity of the motor

by the time in seconds, this result being divided by the weight of the car with driver, the winner being the one with the lowest percentage. The date selected is May 15, and Algonquin will again be the battleground, it being the intention to use Perry hill in the morning for the standing start effort and Phillips hill in the afternoon for the flying start trials. The entry fee is set at \$30 in all but the amateur events, for which \$20 is charged, but the club will rebate half the fee in case of starting. This is to prevent "four-flushing," and has worked well in previous events promoted by the club.

It has been decided that touring cars must carry four adults of an average weight of 132 pounds, while the roadsters, which carry two, will be penalized 264 pounds in the handicap formula to make up for the deficiency. The full card is as follows:

Division 1.—Buggies and Roadsters.

- Class A—Open to motor buggies with wheels 36 inches or over and fitted with solid tires.
- Class B—Touring cars or roadsters of piston area under 50 square inches.
- Class C—Touring cars or roadsters of piston area over 50 and under 65 square inches.
- Class D—Touring cars or roadsters of piston area over 65 and under 90 square inches.
- Class E—Touring cars or roadsters of piston area over 90 square inches.

Division 2.—Free-for-all.

- Class F—Stripped chassis, roadster, baby tonneau or racing cars of piston area 90 inches or over.
- Class G—Touring cars, five or seven passenger, of piston area 90 square inches or over.
- Class H—Two, three or four-passenger roadsters, stripped chassis or racing cars of piston area under 90 square inches.
- Class I—Five and seven-passenger touring cars of piston area under 90 square inches.

Division 3.—Amateur Events.

- Class J—Western amateur handicap championship for four or six-cylinder cars, the winner to be determined by club formula.
- Class K—Amateur free-for-all, touring cars or roadsters of any power.

Division 4.—Team Competition.

- Class L—For teams of three cars of the same make having the best average performance by club formula.

N. A. A. M. VOTES TO ACCEPT THOMPSON CUP

PROMPT action was taken by the executive committee of the National Association of Automobile Manufacturers at its meeting last week—April 8—upon the report of S. D. Waldon, one of its delegates to the meeting of the A. A. A. central conference committee the previous day, on the matter of trade support to the American Automobile Association in its promotion of national contests of various kinds.

The members present voted unanimously in favor of accepting Jefferson deMont Thompson's offer of a \$3,000 cup for a permanent stock car race trophy by way of a prize for an annual international contest. The N. A. A. M. board also confirmed the pledges of its delegates to back up the A. A. A. in its withholding and granting of sanctions and to support ex-

clusively as national competitions the three great annual promotions of the national organization—the annual reliability touring contest, the Vanderbilt Cup race, and the proposed annual event for stock car chassis.

It is practically assured that the American Motor Car Manufacturers' Association at its next meeting of the committee of management will take similar action in conforming the pledges of its delegates to the central conference committee meeting.

At the N. A. A. M. an appropriation of \$500 was made toward entertaining the delegates to the good roads and good laws convention at Buffalo, which is to precede the start of the annual reliability tour on July 9.

SEALED BONNET TEST FOR HOOSIERS.

INDIANAPOLIS, IND., April 14.—The first sealed bonnet endurance contest the city has ever had will be held under the auspices of the Indianapolis Automobile Trade Association on May 20. The three events will be arranged according to the horsepower and possibly for runabouts and touring cars. The course will be a triangular one, about 150 miles long. It is likely that the rules, which are to be arranged next week, will provide that cars shall run a certain number of hours each day, thus avoiding night running. There will be no great attempt at speed.

The routes will likely be arranged to include several good sized cities and towns so that the dealers and manufacturers entering cars can get full benefit of all the advertising possible.

PHILADELPHIA'S USE OF A DUST-LAYER.

PHILADELPHIA, April 13.—After a long series of experiments extending back to last summer, the Fairmount Park Commission has directed Superintendent Vogdes to begin the regular use of terracolio over all the principal driveways in the park. This liquid, which is a composition of asphaltum oil and water, will be sprinkled liberally over the roads once every week or ten days throughout the summer. Superintendent Vogdes declares, as a result of his experiments, that the terracolio treatment will not only save the city money, but will add much to the comfort of those who use the drives, whether horsemen or automobilists. The estimated cost to the city is a half cent for every square yard sprinkled.

WHAT MAY BE CONTAINED IN NEW MASSACHUSETTS LAW

BOSTON, April 13.—Automobilists from other States will have to toe the line when driving in Massachusetts if the bill which has been reported by the committee on roads and bridges passes the legislature. Under the law as it now stands, automobilists registered in other States are permitted to drive in Massachusetts for seven days without registering here. If they commit any offense against the automobile law during that time there is no penalty in the way of revocation or suspension of registration or license. As a matter of fact, many cars registered elsewhere have been driven in Massachusetts all summer, possibly going out of the State at intervals in seeming compliance with the law. Some of these visiting machines have been held up for overspeeding and other offenses, and their drivers have been fined. But, after paying the fine, they could continue to drive, whereas a Massachusetts driver in similar circumstances might lose his license and perhaps the registration certificate of his car.

The new bill proposes to correct this matter by adding to the clause permitting the operation of outside automobiles for seven days without a Massachusetts registration, the sentence: "But if any such non-resident be convicted of violating any provision of the laws of this commonwealth relating to automobiles and motor cycles and to the operation thereof, by any court or trial justice, whether or not he appeals, he shall thereafter be subject to and required to comply with all the provisions of this act relating to the registration of motor vehicles and the licensing of operators thereof." In other words, if the driver of a visiting automobile is convicted of overspeeding in a lower court, he must forthwith register his car in Massachusetts and secure a license to drive, thus putting himself and his car directly under the control of the Massachusetts Highway commission, the same as resident drivers and owners.

The new bill also contains a number of other provisions, among them being the granting to the Highway commission of the right to summons witnesses and administer oaths, and put-

ting on the commission the duty of investigating all fatal accidents by means of a corps of inspectors provided for the purpose, these inspectors to be paid by a special appropriation of \$3,000 and from fees received by the commission. The bill also gives the commission discretionary power to suspend the license of any person whom it may consider incompetent and improper to operate, and it further qualifies the law so as to prevent a person whose license has been suspended or revoked from continuing to drive by carrying his chauffeur in the tonneau. Failure to display the registration plate assigned a vehicle is made an offense punishable by fine or imprisonment.

Under the advice of the Attorney General's office the committee has changed the section of the bill which provided a fine or imprisonment and loss of license for going away "without stopping and making himself known after causing any accident to any person, or any serious accident to any property, unless he can prove a justifiable excuse." This clause now reads, "or who without a reasonable excuse therefor goes away without stopping and making himself known after causing injury to any person or property." The bill also provides for the immediate suspension of the license of a person convicted of reckless driving, operating while under the influence of intoxicating liquor, or running away after an accident, and this suspension is to take place whether or not the person appeals.

The commission is given power to issue certificates and licenses to members of the foreign diplomatic corps without charge, to collect a fee of two dollars for examination of applicants for licenses, and to charge fees of fifty cents each for duplicates of registration certificates or licenses.

The committee has reported "no legislation necessary" on the Governor's recommendation for a tax on automobiles, graded according to horsepower. This is not the end of the matter, however, for it is generally understood that there will be an attempt on the floor of the house to substitute a bill for the unfavorable report of the committee.

NEW JERSEY'S NEW LAW WILL TAKE EFFECT JUNE 1

TRENTON, N. J., April 13.—Unusual preparations are being made to carry into effect the provisions of the new automobile law which becomes operative June 1 next. State Commissioner Smith now has 10 paid inspectors, and 20 unpaid inspectors on his staff, to instruct local authorities and investigate complaints. What interests the autoist most in the new law is the increased rate of assessment it reveals. Cars of less than 10 horsepower must henceforth pay \$3 annually, \$5 for machines of from 10 to 20 horsepower inclusive and \$10 for cars of 30 horsepower and above, while drivers' licenses have also been increased from \$1 and \$2, to \$2 and \$4, according to the horsepower of the car handled, the dividing line being at the 30 horsepower mark.

Makers' annual registration certificates will be at the rate of \$5 each, and will be limited to five cars, for which \$25 must be

paid. These licenses are to be transferable. To accommodate the cab companies, blanket licenses permitting them to drive their vehicles 15 miles within the borders of the State will be issued at a cost of \$100 per annum. Henceforth identification marks will be furnished by the State and all registrations will expire on December 31. Each number tag will also have stamped upon it the manufacturers' serial number, to prevent counterfeiting and running a car without renewing its license. Motorcycles will also be compelled to carry identification marks. Among the other changes in the new law as compared with the old, is a provision making it a misdemeanor to throw glass or other cutting substances on the roadway, also one empowering the road commission to expend not more than \$1,000 annually for the erection of warning signs. The money collected is to be expended for road improvements.

INDIANA IS TROUBLED WITH DOUBLE REGISTRATION

INDIANAPOLIS, April 14.—City Comptroller Breunig has decided that automobile owners need not pay the annual city license of \$3 until the county and State courts have passed on the validity of the license ordinance. There was practically no other step the comptroller could take, in view of the fact that owners have refused to pay their 1908 license fees until a case now pending in the Circuit Court is decided. Should the Circuit

Court decide against the owners, the case will be carried to the Supreme Court, and by the time that court reaches a decision 1908 will probably be past history. About 900 automobile owners in Indianapolis and several hundred in cities where license fees are charged will be affected. It is believed that the State law, providing a State registration, forbids municipal ordinances conflicting with it.

AUTO CLUBS FEEL THE IMPULSE OF SPRING

CONNECTICUT'S BIG CLUB HELPS SIGN POSTING.

HARTFORD, CONN., April 13.—The fifth annual meeting of the Automobile Club of Hartford was held at the Rathskeller of the Hotel Heublein Wednesday evening and the following officers were unanimously re-elected for the ensuing year: President, W. F. Fuller; vice-president, C. H. Gillette; secretary, G. K. Dustin; treasurer, C. D. Alton, Jr. President Fuller in the annual message outlined the growth of the club during the past year, which showed that 150 members had been gained, the membership now being 200. Five new members were elected, and State Highway Commissioner James H. MacDonald was elected to honorary membership of the club. The matter of permanent quarters came up for discussion and was turned over to the entertainment and house committee, consisting of N. F. Allen, chairman; T. Welles Goodridge, R. D. Britton, W. L. Wakefield, and Albert M. Kohn. Clarence E. Whitney was elected chairman of the membership committee, N. F. Allen of the entertainment and house committee, H. P. Maxim of the contest committee, Colonel George Pope of the rights and privileges committee, C. H. Veeder of good roads committee, and C. D. Rice of signpost committee.

The State highway commissioner has been instructed that he will be accorded the hearty co-operation of the club in the work which he has undertaken, and the sign post committee will see to it that proper warning of dangerous spots is placed along the highway.

It was voted to hold the annual orphans' day run on June 5, the same date that other clubs in the American Automobile Association hold the event. Before a great while the club will doubtless be housed in its own quarters. The rapid growth of the organization renders this move essential. Interest runs high in the forthcoming endurance run, the initial attempt of the club, and every indication points to its complete success. The weekly club lunches at the Heublein have proven very successful and have stimulated interest in the organization. The members have been prevailed upon to obey the present law to the letter, as thereby only will the retention of this measure be possible. The present law, which was brought about mainly through the work of the local club, is everywhere regarded as one of the best in the country.

CLEVELAND CLUB BUILDING MODEL ROAD.

CLEVELAND, April 13.—Earnest effort continues to characterize the administration of the Cleveland Automobile Club. Thanks largely to the active recruiting work of its secretary, C. J. Forbes, Jr., the membership has grown so rapidly that the club has aspirations toward pushing Buffalo for banner membership honors in another year.

The club has started work on the new model road just east of Cleveland. A three-mile stretch of road is being built, the entire work being undertaken by the automobile club. It is hoped that when completed it will serve as an object lesson to the State. The club officers have put more hard work and worry on this proposition than any work yet undertaken.

ANOTHER ENDURANCE RUN AT HARRISBURG.

HARRISBURG, PA., April 14.—The Motor Club of Harrisburg has scheduled May 4 and 5 for its second annual endurance run. Five loving cups will be offered as prizes. One of them, which has been donated by Vance C. McCormick, president of the club, is for private owners driving their own cars. The classification will be: class A, for touring cars costing \$2,500 and over; class B, for touring cars costing less than \$2,250; class C, for runabouts costing \$2,000 and over; and class D, for runabouts costing less than \$2,000. There will be six checking stations on the first and three on the second day. At the conclusion of the run the cars will be put through a rigid examination.

NEW LEADER FOR NEW JERSEY'S BIG CLUB.

NEWARK, N. J., April 13.—Announcement has just been made of the regular ticket nominated by the board of trustees of the New Jersey Automobile and Motor Club, to be voted upon at the annual meeting on May 4. The list of nominees will be formed to embrace some noteworthy changes in the official list. Angus Sinclair, a veteran automobilist, has determined to give up the cares of the presidential office. In his place the trustees have suggested that Paul Heller be placed. Another loss that the club will feel most keenly will come through the retirement of H. A. Bonnell from the secretaryship, for a rest demanded by his recent illness. Mr. Bonnell for the same reason will be compelled to relinquish the secretarial chair of the Associated Automobile Clubs of New Jersey. He has been a hustling, tireless, efficient and popular incumbent, and has consented to serve on the club's board of trustees. A. B. Le Massena, who is the local agent for the State Department of Motor Vehicles, has been nominated to succeed him. This will practically mean the moving of the local agency to the clubhouse.

W. Clive Crosby is the nominee for vice-president. Dr. James R. English has been named to succeed J. C. Coleman as treasurer. The trustees proposed are H. A. Bonnell, W. C. Shanley, Dr. F. B. Meeker, A. S. Scherer, and F. A. Croselmir. Messrs. Bonnell and Scherer and Dr. Meeker are new members and Mr. Shanley is named for re-election. Joseph H. Wood and W. F. Kimber hold over.

Although no definite announcement has yet been made, the chances favor the club's holding a 12-hour endurance run on Decoration Day, open only to members. The matter of a possible co-operation of the trade will be referred by Secretary W. H. Ellis, of the local trade association, to his organization. It is believed that the dealers will find more time to support an endurance run planned for later in the season.

L. I. A. C. FITTING UP A COUNTRY HOME.

BROOKLYN, N. Y., April 13.—Much interest has been aroused among autoists generally in Greater New York by the Long Island Automobile Club's perfected plans to open a country clubhouse at Bay Shore, L. I. In this new country home they see advantages of which many would like to avail themselves. Accordingly the Long Island Automobile Club is looking for quite an influx of applications for membership from the members of the fraternity, not only across the big bridges but in the various towns of the island, to which the clubhouse would prove a convenient and attractive rendezvous. The board of governors are pushing preparations for the opening of the new home with vigor. The estate, which is locally known as "Bridgewaters," is a 39-mile ride from the club's city house in Brooklyn. The house is back about 300 feet from the Merrick road. It is 3,900 feet from Great South Bay, where an excellent beach, suited for bathing, is located. The grounds are large and laid out with shrubbery and shade trees. There are spacious piazzas on three sides of the structure. The house is to be conducted as a pleasant rendezvous for members and their families. A competent manager will be in charge, the table will be of the best, and a limited number of sleeping rooms will enable members who so elect to make the country house their living quarters.

JOINT CLUB AT SAGINAW AND BAY CITY.

SAGINAW, MICH., April 6.—Saginaw and Bay City automobilists are planning the formation of an automobile club, for the purpose of promoting good roads in Saginaw, Bay City and surrounding counties, to give endurance and excursion runs, and to protect automobile interests. A meeting will be held this week to perfect the organization. If the club proves to be a success it is the intention eventually to build a fine clubhouse between here

and Bay City, near the Saginaw river. There are about 500 machines in use in Saginaw, Bay City and the nearby towns. It is the intention to have the club formed before the Detroit reliability run takes place.

DETROIT'S CLUB TO LOOK AFTER ROADS.

DETROIT, MICH., April 13.—If highways in the vicinity of Detroit are not kept in shape it will be through no fault of the Automobile Club of Detroit. Franchises on all the toll roads leading out from the city recently expired, and it is now up to private enterprise to make any improvements that are necessary. Realizing this, the club at its annual meeting raised the dues \$5 annually, the money thus secured to be used for good roads. Under the energetic direction of Edwin S. George, chairman of the good roads committee, a fine gravel road has within the last two years been built from Circle City to Pine Lake. Farmers who assisted in the work, although at first indifferent, now find they were benefited no less than motorists and are in hearty accord with the work. It is hoped to arouse interest on the part of residents along highways where toll roads are now no more, that good roads may become general.

The past year was the most successful from every standpoint in its history. Sixty new members were added, making a total of 252. The finances of the organization are in excellent shape, and it was decided to spend several thousand dollars enlarging the clubhouse at Pine Lake, so as to better care for the increasing membership. Officers elected for the ensuing year are: President, Harry Skillman; first vice-president, Arthur Pack, Pontiac; second vice-president, Christian H. Hecker; third vice-president, Walter Brooks; secretary, Frank H. Whelden; treasurer, J. T. Anketell; directors for three years, Dr. E. A. Christian, Pontiac; J. T. Anketell, Harry Skillman.

AGAIN COUGHLIN MAY HEAD WORCESTER CLUB.

WORCESTER, MASS., April 13.—Stillman L. Shaffer has been appointed active secretary of the Worcester Automobile Club. The club has engaged Arthur G. Dodge as secretary for the Dead Horse hill climb committee, which event will take place June 6.

The board of governors has named these officers to be voted for at the annual meeting, May 5: President, John P. Coughlin; vice-president, C. A. Harrington; secretary, George E. Stimpson; treasurer, H. P. Bagley; two members of board of governors, F. P. Gay and Alfred Thomas.

FORT SMITH, ARK., ORGANIZES A CLUB.

FORT SMITH, ARK., April 13.—Thanks to the efforts of Fred A. Rentzel, there was organized last Monday night the Automobile Club of Fort Smith. It started with 30 charter members and elected the following officers: President, John Vaile, Sr.; vice-president, George H. Lyman; secretary and treasurer, Fred A. Rentzel. The above, with Frank Handlin and C. E. Spers, will make up the board of governors. It will join the Little Rock club in organizing a State association with A. A. A. affiliations.

ARKANSAS VALLEY CLUB'S NEW OFFICERS.

PUEBLO, COL., April 10.—At its annual meeting last Saturday the Arkansas Valley Automobile Club elected the following officers for the ensuing year: President, Lee Graham; secretary and treasurer, Homer E. Brayton. These with the following were chosen as trustees: George E. King, Dr. Crum Epler, and L. G. Walker. The club will begin an active campaign for the betterment of the roads leading into Pueblo.

100-MILE RUN "TO SHOW MISSOURIANS."

KANSAS CITY, Mo., April 11.—The Automobile Club of Kansas City, at its regular monthly meeting on Thursday night, decided to hold a 100-mile endurance run to St. Joseph as soon as the proper details can be arranged. The treasurer reported a balance in the bank of \$1,787.47. The membership is now 180.

WINTON OWNER WON CAPE MAY CUP.

PHILADELPHIA, April 13.—"Winton No. 10," owned and driven by F. M. Johnson, annexed first prize, the handsome Hotel Cape May cup, in last Saturday's "roadability" run of the Quaker City Motor Club. Johnson drove his car over the 92-mile course at a rate of speed which brought him to the finish but a fraction of a minute shy of the 5 hours 54 minutes 18 seconds which the contest committee had agreed upon as the official legal speed limit time. Of course, none of the 29 contestants knew the limit agreed upon by the committee, and the majority of them were very circumspect, adhering very closely to the 10-mile-an-hour limit in towns and villages and opening up to the 20-mile limit in the country.

Dr. E. M. Lingle, driving his own Matheson, captured second place, arriving at the finish 25 minutes ahead of time. Another Winton, driven by A. E. Maltby, was awarded third place, having anticipated the official time by 26 minutes. Some of the contestants took chances and "beat it," not a few cars arriving at the "Cape" before 4 o'clock—a rate of speed which would render them amenable to the speed laws, if apprehended. Fortunately, the South Jersey *Vidocqs* were all looking the other way on Saturday, and no one reported having had a run in with them. Although heavy rains during the early part of the week had torn out the road badly in some places, the going generally could be characterized as "fair to fine," and that so many of the contestants honestly sidestepped the temptation to "throw 'er wide open" argues well for Quaker self-control.

Arriving at the "Cape," the automobilists found the town agog, the occasion being the official opening of the big new Hotel Cape May, a modern inn, with accommodations for a thousand guests and costing upwards of a million dollars. The awarding of the prizes to the winners was made the occasion for the exchange of felicitations by all hands over the bright prospects for Cape May's rehabilitations.

FOR THE PRINCE HENRY TOUR.

BERLIN, April 10.—The committee of the Imperial Automobile Club for the Prince Henry Tour points out the fact to intending competitors that every car must be fitted with a speedometer in such a position that official observer can always control the speed rate the car is traveling at. The new itinerary for the event, which has been greatly altered, runs as follows:

Berlin-Stettin	298.5	kilos
Stettin-Kiel	398.8	"
Kiel-Hamburg	368.3	"
Hamburg-Hanover	287.9	"
Hanover-Cologne	328.9	"
Cologne-Trier	250.3	"
Trier-Frankfort	230.5	"

Total.....2,163.2 kilos

The hill climb will take place at Bacharach in the Rhine district and the speed trials at Itzelioc.

Competitors must also note that a reduction has been made in the weight of the cars, which now must weigh 800 kilos and not 860, as in the first set of conditions. This does not include spare tires, inner tubes, petrol, water and oil, but in order to facilitate the weighing-in cars may appear at the scales with oil, water and petrol, the weight of which will be docted against every car as 60 kilos and the minimum total weight must be at least 860 kilograms, with engines of a total piston surface of 227 square centimeters. The weighing-in takes place at Charlottcnburg, June 7 and 8, and with two exceptions the vehicles start daily at 6 A.M. On June 12 they are let off at 5 A.M. and on the final day at 7 A.M.

ANOTHER CLUB ORGANIZED IN IOWA.

OLWEIN, IA., April 13.—The Olwein Automobile Club has been organized. It starts with a membership of 25, and with J. F. Cole as president and W. J. Brennan, secretary. Other officers will be chosen when the following committee on constitution and by-laws makes its report: Leo Kerwin, T. E. Kint, J. W. Ridler, W. H. Bloom, and R. C. Baker.

THINGS NEW IN THE INDUSTRY AT DETROIT

By BERNE NADALL.

DETROIT, MICH., April 13.—THE AUTOMOBILE and *Motor Age* being desirous of ferreting out all the newest things on the tapis for the season, as well as the novelties in the way of tried and proved principles in which the makers are more particularly interested, I made it a point to call early at the Aerocar Company plant, as I had learned this concern intended to market a new model at a popular price. I found considerable activity in the various departments, and learned that C. A. Benjamin was in Los Angeles, pushing the Aerocar line on the coast. This year the Aerocar people will bring forth an entirely new model of slightly smaller type at a price that should be an attractive one to both the agent and the moderate-priced customer. This newcomer will be known as Model E, and will be water-cooled. The design of the car is nifty, and the body construction is of a triple combination type, being transformable into a two-seated, baggage-carrying runabout, or a three-seated runabout, or a four double-bucket-seated tourabout. In the illustration of this neat appearing combination car it will be noticed the general design shows a good balance, which is not always the case with constructions of this kind. It also will be seen by noting the illustration of the single rear seat that the various changes are made quickly, and without leaving that unfinished look such as often is found in detachable rear seats. This little car is fitted with a Continental engine, and the chassis contains long springs, racy fenders, and full equipment.

The policy of the Aerocar Company to supply either air or water-cooled engines as in former models will still be adhered to. These models also have been drawn down to finer lines, and the various refinements which the Aerocar people have put into them make them more attractive than heretofore. As this concern also is of the opinion that the time is ripe for a cheaper car it has sprung a surprise on the motoring world by listing these 4 by 4-inch air and water-cooled models at a considerable reduction, considering the class of articles made. Those who have wanted a good touring car of medium power at a medium price are certainly benefited by this tendency to market a smaller and lower priced car. If this is a criterion of the values to be offered the small town agent will be very much benefited.

A larger 40-horsepower model is also going through the factory. This model, designed by Mr. Melanowski, late of the Dragon and other firms, appears to be of good workmanship, and has ample power, but Advertising Manager Campbell declares the season for large cars will be an off one, and the company therefore would not now place this model on the market. As he termed it, the motor industry has its off seasons like other branches of the commercial world, which, he said, is a repetition of nature—as the apple tree does not bear good and sound fruit each season.

The 1908 Thomas-Detroit Has Many Refinements.

Of the several new products which are finding a good market few are more appealing than the 1908 Thomas-Detroit. This car, with its numerous refinements, is very much like a French production. The design closely follows the lines of the best continental practice in every detail, even to the position of the front axle, which is thrown out almost in line with the radiator. The executive staff of this concern is made up of young men, from Mr. Chapin, who has only recently returned from the western coast, where he claimed to have found good picking,

down to the front door guardian seems to be well suited to meet the various requirements. Also the congenial works manager, Mr. Brady, was found at his desk filling in the morning orders for Thomas-Detroits in green ink.

When asked what particular feature of the car was his greatest delight, Mr. Brady replied, "the car itself." To judge it as a whole was his wish, and the remark became more forcible as more of the factory was visited. I found the car had no frills and was what one might call a common-sense engineer's job—a well balanced proposition, such as the very best representatives of the modern American automobile of the very highest type have come to be within the past three or four years. A construction eminently fitted to withstand unlimited hard usage.

One of the points that appealed as worthy of mention, however, is the oiling system of the engine. The system is not new, but the Thomas-Detroit people have made it quite successful by the application of a well-designed pump and sight feed. The pump is integral with the engine and is of the gear-driven type. It is placed on the bottom piece of the crankcase, and pumps from a duct in the bottom of same up through the dash sight feed, thence by outside leads to the three main bearings of the

New Aerocar, Model E, with Triple Combination Body.

crankshaft. This is following the best European practice, as it gives a constant crankcase level as well as a splash feed; but the sight gauge seemed a decided improvement in that it forms a sort of visible tell-tale at all times of any obstruction in the flow of oil. As shown in an illustration, the complete system, with the leads to and from the pump and crankcase through the gauge, is compact. In another illustration the gauge itself is shown, with the pump pipe ending in a goose-neck shape in the glass gauge. It will be obvious to one that as the pump lifts the oil up to and through the gauge any debris that may perchance find its way into the leads will cause the sight gauge to fill up beyond the neck of the pipe as the pressure from the pump always is there; and unless free and continuous flow of oil is obtained the gauge must fill, which at once tells the driver something is wrong and needs attention. Usually there is nothing but a thin pipe with a glass tube inserted in it, or a drip arrangement which is, as a rule, so oily one cannot detect such discrepancies at a glance. In filling the case with oil the method of determining the quantity put in is by two pet-taps at different heights in the crankcase. If oil runs out of the highest tap the case is full. The Thomas-Detroit people claim 500 miles can be run on one filling.

As in all parts of the Thomas-Detroit, the gears are put through a rigid test to secure perfect working in every car sent out. Road tests of cars, even 200 or 300 miles, will not always secure the loosening up of stiff gear parts. While the engine generally is worked out, in many cases the gears or the gear

Detachable Mud Apron or Underpan of Thomas-Detroit

levers will still show newness, or stiff action. The Thomas-Detroit gear test is equal in every respect to the engine test or I might say sufficient for the demand. The gear set is of the Brown-Lipe pattern. I should term this pattern of gear-shifting the flip type.

Another point which deserves mentioning is the fine underpan, which is fitted. An underpan does not seem to be of much importance and often is considered a great nuisance. It is always clumsy, ugly and hard to take down. In the case of the Thomas-Detroit pan, the design has been studied with the same care that characterizes the running parts; in fact, I found this condition to prevail in numerous parts which are considered of minor importance by some of the makers. Detaching or attaching of the pan can be effected without the use of tools within two or three minutes.

In the first place the design is part of the design of the car frame itself, the sub-frame having grooves to take the swaged edge of the pan, which is slid into place from a point under the gearbox forward to the front of the car, making a dust-proof fit. In addition to the grooves supporting the pan, six spring clips or hooks are sprung into holes made for the purpose. The whole pan, which is semi-cylindrical, is 24 inches across, thereby taking up very little room under the car, and at the same time being almost unnoticeable.

The spring suspension is ample. It is a noticeable fact that this part of the American motor car has shown such improvement within the last two years that to-day it can claim to be the leader in this respect. The exemplification of this fact never was made plainer than when the foreigners recently commenced to traverse this continent in the New York-to-Paris tour. I also can include the frames, and other parts of the chassis of American-built cars, which no longer are a trouble, notwithstanding the almost impossible road conditions. A glance at the illustration, which also gives a view of the underpan, shows the long wide springs fitted to the Thomas-Detroit cars.

Numerous other interesting data could be given of this new

Double Muffler as Applied to the Silent Northern.

proposition, but as I am dealing only with special matters space limits me. However, it is worthy of note to point out advantages shown in the use of large ball-bearings, and solid plain crankshaft bearings which usually are not considered good practice; but in the case of this firm, good design and careful assembling have been found to give every satisfaction. Also the good balance of the car enables the engine to produce a horsepower for every 60 pounds it carries in dead weight. Considering that this firm is hardly two years old, and that it has turned out something more than 600 cars, which are giving satisfaction in every part of the country, the achievement stands out as a credit to the industry.

There is nothing that succeeds like success and when it is applied to actual experience it becomes the concrete fact. No prejudice can assail the product of an institution that has become successful no matter what opposite view one might make of it. It is often said that the double opposed or the one-hunger is a freak or a frost or some such expletive as ruthlessly slaughtering in its purport; but the proposition remains defensible as long as the promoters can show a return for their investment.

The Silent Northern.

Since the day the Silent Northern received its appropriate name it has steadily gained in favor. Northern cars, those of the double-opposed, two-cylinder type, are better to-day even than ever before. They are made in a first-class shop and made well. There are not many cars of medium price that can boast of so well equipped a shop and such a good organization as have the Northern. The main office is located in Detroit, but an equally large factory at

Thomas-Detroit Dash Tell Tale Lubricator.

Port Huron is under the same control. A visit through the Detroit works was sufficient to learn that this place is a solid institution and that it is a fine plant. To acquaint the reader with practices such as might interest the engineer as well as the layman buyer, it is not amiss to point out one or two advantages such as have been obtained by the above mentioned conditions. In the first place, it is plain that manager, foreman and mechanic are wholly in touch with each other. This unity of officers and men means that any leak that might otherwise occur will be detected almost at once and made right before it is too late. Also any cheaper or better way to perform a difficult piece of work would just as readily be discovered. A case in mind is one where sand-blown cylinders are transformed into first-class bright castings, by galvanization. These castings, like most castings of such a nature, were too often of the pinhole variety, or sandy, and sometimes porous—which condition was not always discovered until the casting had been machined, fitted in a car and sold. I am told that as high as 45 per cent. of the castings received was sometimes rejected, much to the annoyance of the foundry and the recipient, and that it is imperative to do something to overcome the trouble.

While I did not learn whose idea it was to galvanize the cylinders, I found them to be clean and clear and of a close and smooth texture. The cleanliness alone seemed to compensate for the extra cost incurred galvanizing them, which is stated to be about \$1.25 each. The rejected castings at the present time do not equal two per cent. and the fact that the interior of the cylinders also is coated makes them somewhat proof from quick carbonization, the surface being more of a repelling nature than one of adhesion, which is obvious from the very nature of the rough interior of an ordinary casting, the pebbly surface holding dirt much firmer, especially gas burnt oil products. Also it is noticeable in machining that the interior of the cylinder is of such a reflected

Thomas-Detroit Oiling System

brightness that the work became much easier on account of being quite visible. Thus it is explained that a vital benefit is obtained by the unity of an establishment.

Other novel things on the car are the exhausting of the engine gases, the spring and shackle suspension, the plug position, and the absence of torsion or stay rods, also the interesting manner in which the finished cars are tested with regard to hill-climbing ability. Taking the plug position first, it will be seen in illustration how the plug is pocketed in a remote corner of the cylinder. I am told the position given the plugs in Northern double-opposed engines is one which was adopted after much experimenting on the subject. While it seems wholly contrary to all laws regarding spark plug theory this firm advises that its plug trouble since placing it as shown has quite vanished. The sooting, carbonizing and oil-wetting troubles so frequent in the four-cylinder upright engines are thus eliminated by what most people term very bad practice, or, in fact, a practice I never before saw, except, I believe, some years ago when the Mercedes firm tried it for a while. This is such an interesting subject a whole book could be written on it, and I would very much like to hear from other sources on experiences gained by others, as much data could be collected that would be of general benefit to the trade. In drawing attention to the general suspension of the car one illustration, which shows the car on the roller-testing stand, gives a profile of the runabout where it is plainly seen that no torsion rods or stay supports of any kind are used. This is another instance where everyday practice has been thrown to the winds, but, from what I learn, good results accrue. Heretofore the one or two other firms I have known which have tried the torsionless chassis have eventually given way to popular sentiment—or perhaps for other reasons—and fitted such members, but this firm refrains from believing that it is necessary in the car in question, and it states it has been experimenting on such lines for a number of years. It has even followed, or perhaps originated, certain spiral spring principles which have been incorporated into the drive shaft—only to be thrown out again as no good, after long experience.

This spring idea, which once I saw in

France, was at one time heralded as the solution of the flexible drive *très bon*, but it soon went the way of other such arrangements, yet the difficult problem as instituted into this car seems to work out well. The firm states it has yet to have a complaint from that source. The Northern people believe in it and claim their numerous cars now running in all parts of the country bear them out. I have made it a point to try the principle since leaving the works and find in the action a lifting and falling of the full elliptic rear springs which are fitted to the car. While it may appear from the fact that the remark implies a defect in the spring and falling of the spring ends E and F the reverse is the case. This rising and falling in no way seems unsound no more than the deflection of a spring. In starting, which I had demonstrated by using the high gear, I saw a clear swiveling action, apparently thoroughly practical in this case, receiving the sudden application of the power to the outer periphery of the driving wheels through the springs, giving a partially retarded movement to the car. The jerk, so prone to the usual direct drive, is quite absent and it seemed quite unlikely much trouble could occur from the adoption of such a principle here. Suddenness of action does not take place and therefore any carelessness that might seemingly cause a snap somewhere appears very remote. Only one universal joint is used at the front end. The engine also is set slantwise, declining towards the rear, making the drive more direct. At the universal joint a sleeve is fitted, which practically is unlimited in its movement either forward or backward, as much as 1 1/2 inches being apparent under the most sudden conditions. As one must judge by ocular demonstration, as seeing is believing, it cannot be said the practice of the Northern is wrong. The isolated position of the spark plug, the torsionless drive and the galvanized cylinders should be enough at one time to talk about, but in the case of the Northern it apparently thinks from both ends, as it were, like the burning of the candle; however, it does not believe in hiding its light under a bushel as it makes it a point to bring all prospective buyers into the works to see with their own eyes.

The company also works from both ends, as Mr. Gunderson, the manager, puts it, in that it commences to assemble its chassis by fitting the monster mufflers first. As it seems correct to do it, it again is another unorthodox proceeding which is in no wise a derogatory or assailable practice. The manner adopted of exhausting the engine gases is novel in the practice of carrying it out only. It is exactly what others are slowly coming to, namely, expansion room spread over large areas and a minimum of baffling. Look at the large four-cylinder cars of good make to-day and you will see a 50 per cent. increase in the size of the exhaust pipes, expansion chambers or mufflers over what existed only a few years ago. Everybody knows that if they could hold the exhaust gases long enough to cool to a temperature equal to that of the outside atmosphere, when deposited into the open air there would be no sound at all. This is just what is happening everywhere now. The Oldsmobile was one of the first to give plenty of expanding area in America and that car has become known as one of good muffling. The manner of passing away the hot gases on the Northern is illustrated, the

Roller Testing Stand at the Northern Factory.

Northern Motor Spark Plug Scheme, Showing Isolation.

drums being what is termed the high pressure and the low pressure boxes respectively. The left box only has a perforated pipe running through its extreme length which retards the passage of the fresh hot gases enough to reduce their expansion properties to a point low enough to cause them to be quite weak, after which they are passed into the second right chamber and allowed to flow out upon the air, quite cooled and weak. It is claimed the two-cylinder horizontal engine is much harder to make quiet than the vertical engine; however, the Northern motor seems to have earned its sobriquet honestly and simply. It will be obvious to anyone that back pressure almost is reduced to nil.

Detroit is known for its motor car originality, and I have found it quite true; but it should also imply that its originality is mostly sound as I have found any variation from the regular paths to be based wholly on good engineering practice. Sometimes art or style will predominate over science, but not so marked here. Take, for instance, the French custom of hanging the spring shackles, which is followed the world over. It may be right to design that little shackle to hang obliquely always. It looks as if it need not be so, but the whole world seems to have followed the French. And perhaps the French only copied it from the landau of German origin or the calèche which we Americans can see by taking a little trip to the town of Quebec in Canada where they are the favorite horsedrawn vehicle to-day. One illustration shows the style the Northern has adopted. The company points out the reason for such a change and the feasibility of it seems apparent. It is a fact that an obliquely hung shackle will only allow of a spring rebound equal to the tension in the spring. A quick drop into a hole and a further sudden fall of a motor car running at good speed will be sufficient to show what happens to the body, or a car when the shackles are oblique. The hinge movement of the shackle on the return of a spring is not the same as that on its downward throw, and it is apparent the shock absorber has its existence mainly from this cause. Hang the little shackles vertical—or nearly so, sufficient to act as desired—and the return of the spring will be confined to the power of its tension or deflected state. It must return through the shackle on dead center, as it were, and not through the shackle as a hinge. That is the reason the Northern has so set its shackles. If this argument can be assailed I fail to see how, as the function of the shackle primarily is to allow for the varying lengths of the spring under the varying stresses. In the shop I find good engineering practices of the modern school and the equipment is

first class. The gears are cut right in the factory and one of the latest Gleason arc machines is turning them out at a good rate of speed. Jigs are used throughout the shop and no fewer than twenty-four separate parts are being ground for model C, a remarkable instance of good shop practice when the price of the car is considered. Organization and practical mechanics alone can account for such results.

Particularly interesting is the manner in which this firm tests its cars for hill-climbing. I specially asked Mr. Gunderson for a sketch of the rollers on which his tests are given. The idea as applied here is novel, particularly the means of altering the stiffness of the grade. The rollers are such as are used in other places to run out the engines, but in this instance the Northern people have so arranged the rollers that simply altering the spindle distances, which allows the car driving wheels to drop lower or rise higher as the case may be, changes the resistance given to the power plant. It is plain that such a principle theoretically figured out would give such results as could only be obtained by actually driving the car up inclines, the only difference presumably being the taking away of the traction of the front wheels. This, however, is no doubt partly compensated for by the small resistance that must necessarily occur at the point of the driving wheels where they are in contact with the rear roller. It must be remembered that the drivers must touch on two points and the weight is as great on the rear roller as on the forward one. It strikes me that this idea is one that while crude to begin with will work out to a greater degree of satisfaction than any other of which I know.

APPLE ELECTRIC COMPANY IS ORGANIZED.

DAYTON, O., April 13.—H. V. Apple, O. D. Apple, and V. G. Apple have withdrawn from the Dayton Electrical Mfg. Co., and have gone into business on their own account as the Apple Electric Company. The new company has already placed on the market its improved storage battery, and will shortly announce its new dynamo-floating storage battery ignition system, which will embody a number of up-to-date improvements. V. G. Apple still retains his interest in the Dayton Electrical Mfg. Co., and will continue to serve as vice-president.

Vertical Spring Shackle as Shown on the Northern.

AUTO INDUSTRY NEWS FROM HARTFORD MOST PROMISING

HARTFORD, CONN., April 13.—The outlook for the coming season in this city is particularly bright, and both the local factories report business as good. The Electric Vehicle Company's plant is running with a force of about 250 men, and all the 29-horsepower cars that can be built are being sold as soon as ready. The Boston agent wanted 50 cars for immediate delivery, and made good his request by a certified check for the amount of purchase, but delivery in the desired time could not be made. The Pope Manufacturing Company is shipping quite a batch of the Hartford models, and on one day last week 14 were sent over the rails to buyers. The Hartford Rubber Works Company is running overtime. This is another tangible indication that business has improved. This plant has been operated on a short time schedule more or less all winter.

The retail dealers have had a very satisfactory time of it since the Hartford show last January. The Capitol City Auto Company will market the Mitchell this season, and thus far have made many sales. A. W. Peard has taken on the Overland runabout, heretofore unknown in this city. The Connecticut Steel & Wire Co. have taken on the Stoddard-Dayton, in addition to the Reo, both new ones to Hartford. The Elmer Automobile Company continues another season with the Ford runabout, the Britton Brothers sell the Maxwell, while the Palace Automobile Station will market the Thomas, Autocar, and Oldsmobile. Every one of these dealers has had a lively season and things look unusually bright. The same holds true of Brown, Thomason & Co., agents for the Packard, Stevens-Duryea, and Cadillac. T. Dudley Riggs represents the Isotta Fraschini and Simplex, and regards the outlook as most promising. The Post & Lester

Co. have opened a downtown branch on Asylum street in the heart of the business district. Hartford motoring circles are optimistic, and there is no reason to be otherwise.

Despite all denials to the contrary, there is every reason to assume that the Packard Motor Car Company will shortly be in possession of the Electric Vehicle Company plant. It is rumored that the Columbia light gas car will be continued as Packard No. 2, and that a Packard transmission on the rear axle will be substituted. The motors for the commercial vehicles will be built at Detroit and shipped complete for assembly to this city. The least that can be said, is that when the plant goes it will be acquired by the Packard company, and this move is much desired by local interests.

Halsey M. Barrett and Henry W. Nuckols, receivers of the estate of the Electric Vehicle Company in the district of Connecticut, have filed with the superior court the following report of March business. The report shows charges on account and cash sales of \$37,457.21, with purchases of \$7,740.27.

The cash statement shows balance on hand, March 1, of \$30,056.90; collected on Electric Vehicle Company account, \$1,138.37; collected on receivers' account, \$41,514.16, and on miscellaneous sales, \$157, showing a total of \$72,711. Disbursements were: Pay roll, \$10,997.49; traveling expenses, \$240; purchase creditors, \$4,152.04; receivers' salaries, \$1,800; receivers' bond, \$400; refund of advance payment, \$1,500; freight and express, \$291.46; telephone and telegraph, \$163.80; salesmen commissions, \$188.18; petty cash, \$181.12; operators, \$2; total, \$19,894.09; balance on hand, April 1, \$52,816.91. This shows a good increase in the cash on hand over the month of March.

INDIANA FARMERS ARE BUYING AUTOS AND BUILDING ROADS

INDIANAPOLIS, IND., April 13.—Although the season has not far advanced, practically every county in Indiana is arranging to build several miles of roads during this Spring and Summer. In fact, the amount of road building will doubtless exceed that of last year, and the year 1907 was a record-breaker.

As a result of last year's and this year's road building activities, Indiana will have one of the finest networks of improved roads in the country. Practically all road improvement is being done under the recent State law, providing that on the application of fifty property holders in a county an improved road not more than three miles long and connecting two other improved roads, shall be built.

Inquiries have been directed to a large number of counties on the subject of road building, and it is evident that road building in Indiana in 1908 will aggregate fully \$8,000,000, all of

which must be borne by the property holders by assessment.

In Hamilton County, of which Noblesville is the county seat, bids are now being asked for the construction of thirty-six roads, to cost about \$150,000, and aggregating sixty-four miles. Blackford County is preparing to build thirteen new roads; Bartholomew, three miles; Dearborn County, two and a half miles; Hendricks County, two and a half miles; Knox County, three miles; Jackson County, about twelve miles; Clinton County, twenty miles; Daviess County, ten miles; Lawrence County, eight and one-half miles.

It is interesting to note that in almost every instance the farmers are back of the good roads project, lending their best efforts and spending their money. The fact that farmers want rural routes, and are rapidly adopting the automobile, are the principal reasons for the great amount of road building.

PITTSBURG SHOW RESULTED IN SALES.

PITTSBURG, April 13.—With the starting of the Pittsburg-Philadelphia race between the Reo and Maxwell cars, the second automobile show at Duquesne Garden, Pittsburg, practically closed Saturday afternoon. More than 1,000 automobilists were gathered to see the start.

More than \$250,000 worth of automobiles were sold at the Pittsburg show. The Banker Brothers Company alone sold cars to the value of \$87,000. Of the 16 machines they disposed of, 13 were Pierce Great Arrows and 3 Stevens-Duryeas. The Moon people held a special show at the Hotel Schenley all the week and reported large sales. Nine Maxwell cars were sold during the week. Other agencies announced sales of from one to four cars. The sales of accessories were away ahead of the total last year. Manufacturers placed some good agencies.

BOSTON'S 1909 SHOW TO BE IN MARCH.

BOSTON, April 11.—The first meeting of the directors of the Boston Automobile Dealers' Association since the Boston show was held a few days ago, and after Manager Chester I. Campbell's accounts had been examined, it was decided to declare a first dividend from the show profits. The earnings of the show were very satisfactory, though somewhat less than last year.

It was decided to hold the 1909 show at the corresponding time, that is during the second week in March. The directors have had under consideration several propositions for changing the scene of the show, but they decided to continue in Mechanics building, and voted to take a lease of that building for the next automobile show. The management of the show will be decided at the annual meeting in June, when the election of officers will be held, and possibly new members admitted.

TRACY MAKES INTERESTING FUEL TESTS.

The fact that gasoline of the proper quality for automobile use has been constantly getting scarcer for several years past, has led numerous experimenters, both here and abroad, to try the virtues of alcohol and a number of other promising substitutes for gasoline. One of these that has come to the front is benzol, and Joseph Tracy, who has made a close study of the fuel situation for some time past, made some interesting experiments with this fuel last week, in connection with the dynamometer of the Automobile Club of America. A Simplex run-about handled by Frank Lescault, of the Palmer & Singer Company's forces, was mounted on the rollers of the dynamometer and first run on gasoline for a considerable length of time, and later on benzol. The car was geared high and special attention was paid to the results shown by the gradometer.

No carbureter adjustments were required on changing fuels, the results showing them to be perfectly interchangeable. The use of benzol showed a slightly increased power output and greater drawbar pull. With this fuel the power developed was sufficient to climb a grade of 12.1 per cent., which was increased to 12.2 per cent. by making a special carbureter adjustment, the drawbar pull being 398 pounds, while the maximum with gasoline was 383 pounds, representing an equivalent grade of 11.9 per cent. Mr. Tracy carried on his experiments throughout the week, culminating in the power tests on the club dynamometer, and he said that as a result of these tests and the close investigation that has been made of the subject abroad, he felt convinced that much of the doubt in the fuel situation was solved and that autoists need not fear anything from the rising price of gasoline for the next few years, at least. Benzol is a by-product of the manufacture of coal, and is water-white in color. For use on the automobile, little or no change in carbureter adjustment is necessary, as benzol vaporizes as readily as gasoline. Mr. Tracy will continue to prosecute his investigation, verifying the various findings.

OLD AUTOCAR RECALLS ANCIENT HISTORY.

A car in the ancient and honorable division of last week's big parade in New York that attracted no little notice was an Autocar of 1901 model. It recalled some early history of the industry and a road feat of the long ago as well, particularly pertinent to a celebration of the wooden anniversary of the automobile. Designed by Louis S. Clarke, the present consulting engineer of the Autocar Company, the car was the first shaft-driven automobile built in this country, either experimentally or commercially, and at a time when there were but three other manufacturers in the United States. The widespread acceptance of the shaft drive theory added to the interest in this parade exhibit. This car established the first automobile road record between Philadelphia and New York, Mr. Clarke driving it from Madison Square Garden in 6 hours 10 minutes. This was in January, 1902, with the roads badly cut up and abounding in frozen ruts. A fresh battery and new tires was all that had been done for this early model to groom it for its appearance in the carnival parade.

The Autocar Company, it will be remembered, was formed and incorporated in Pittsburg in the summer of 1897, it being the outgrowth of the original ideas of Messrs. Clarke, who were firm in their deep conviction that the automobile's utility would be acknowledged by the public the moment it could be demonstrated. At that time, it must not be forgotten, the large rubber companies of to-day had not been formed. Solid tires were the vogue and pneumatic tires were but slightly removed from garden hose. Even more discouraging than the absence of suitable tires was the impossibility of securing a spark coil. None was understood and none was manufactured, so Mr. Clarke had to develop one of his own for the purpose. After three years in Pittsburg, the Autocar factory was moved to Ardmore to secure the benefits of the Eastern markets both as to sales and supplies and to take advantage of the unexampled good roads in the section for a thorough testing of the cars.

PEOPLE WHOSE SAY-SO IS WORTH WHILE.

General John T. Cutting, Oldsmobile Co., of New York: "The prime object of the carnival parade was to give visible evidence to the people of the progress that has been made in the first decade of the automobile industry in this country. This object was skilfully carried out, and the almost total absence of breakdowns, even on the part of the old models, convincingly demonstrated, even to the most skeptical, that the era of practical perfection had been reached. I think nearly half a million persons lined the route of the triumphal march, attracted by nothing more than an industrial display, proving beyond the shadow of a doubt that we are only at the threshold as yet. What percentage of the huge throng will eventually drive their own pleasure machines or install automobiles in their commercial delivery departments it would be folly to guess, but it will undoubtedly be a large one. Every man in the business who rode through that vast assemblage which packed New York's finest thoroughfares was deeply impressed by the interest of the public."

Benjamin Briscoe, Chairman American Motor Car Manufacturers' Association (discussing the proposed railway show): "Such an elaborate affair as is under advisement by the A. M. C. M. A. would prove to be a great boon to the industry. The event as planned by the association would give the participants an excellent field of new buyers. It would take the cars to the very homes of the buyers, thus saving the public time and money as would necessarily be spent in attending a New York show. It would reach people who would not and could not attend the show. It is for this class of people that the event would be conducted, and I thoroughly believe it would be a paying proposition based from a strictly business standpoint. It would kindle motoring interests and arouse new enthusiasm in those who at the present time have no idea of purchasing an automobile."

Hugh Chalmers, President E. R. Thomas Detroit Co.: "Heretofore automobiles have been bought. Now they must be sold. Reliability in the car and organization in the company, are the two essentials in the future for automobile manufacturers. The country must be so districted and the selling force so organized that dealers or agents can call upon the prospective buyers quickly and frequently. These dealers or agents must be taught the superior features of the cars they sell. And their agencies or branches must be organized to give efficient service to users at reasonable prices. The automobile business has got to a point where it is going to be a case of the survival of the fittest. And the fittest will be those manufacturers who not only make the best cars, but also build up the best selling organization."

Morris Grabowsky, Grabowsky Motor Vehicle Company, Pontiac, Mich.: "What builders of commercial vehicles want most is better roads. Heavy motor trucks must have good footing or else they cannot do what is expected of them nor what they are equal of accomplishing. The first requisite in all cases is road conditions favorable to the operation of the commercial vehicle. When the various Legislatures will make adequate appropriations for road improvements then the transportation proposition solves itself."

AUTO PARADE TO BE PART OF SUBWAY DAY.

JAMAICA, L. I., N. Y., April 13.—Jamaica, L. I., is to make an automobile parade a part of its celebration of the opening of the subway, June 4, 5 and 6. George Morris, chairman, J. P. Disbrow, John Leonardi, George K. Cooke and Charles C. Crossman are the committee in charge. It is proposed to hold the parade at night, to choose a king and queen, and to have a decorative division. A "rose section," in which the paraders will be solely women, their cars being decorated with roses, is to be made a special feature. Hillside avenue, a macadamized boulevard, fully 200 feet wide, running through a handsome residential district, is to be included in the route of the parade, which promises to be the largest ever witnessed in this section of Long Island.

SUCCESSFUL TRY-OUT OF THOMAS DETROIT.

After having completed a unique trip, consisting of a 2,000-mile run in midwinter with all the gears, including the reverse, removed, the Thomas-Detroit "Snowbird," a picture of which is shown herewith, has been placed on exhibition at the Chicago salesrooms of the E. R. Thomas Motor Company. The car has not been touched since it ended its trip, and its driver, C. A. Hills, says it is in fit condition for another 2,000 miles under equally strenuous circumstances. One of the most trying tests to which the car was subjected in the course of its run was the ascent of some of the bad hills for which Cincinnati is noted.

The start was made from Detroit in the thick of a blinding snowstorm, Salesmanager Lee Counselman piloting the car as far as Toledo, where C. A. Hills took charge, ice making steering difficult on the way to Findlay, O. From there to Columbus, O., the going was better; thence, the route lay to Dayton, O., much of this distance being a subaqueous trip, owing to the river having overflowed its banks. Salesmanager Counselman again took the wheel and drove the car to Cincinnati. The next large city on the route was Indianapolis, via Richmond. Then on to South Bend, via Peru, Ind., and from there to Chicago, where the test was officially ended.

The Thomas-Detroit "Snowbird" Living Up to Its Name.

EXPLAINING THE PATRONYM OF THE MOON.

St. Louis, April 13.—Automobilists and the public at large, particularly in the East, very frequently wonder where the Moon car obtained its name, and sometimes think its appellation is a tribute to the lunar system. However, practically everybody in the West is familiar with the record of Joseph W. Moon, president of the company that manufactures the car, and the source of its name as well. Mr. Moon is one of the oldest and most prominent manufacturers in the West, the name having been a household word in the Middle West for several generations, as the family first became famous prior to the Civil War, as manufacturers of the first rifled shoulder gun placed on the market. In earlier days, the possessor of a Moon gun was an object of envy by his fellow sportsmen, that firearm possessing some individual characteristics that were distinctive and desirable.

In after years Moon buggies and carriages became famous and made the name ever better known through the Central West, the growth of this business having had considerable influence on the success of St. Louis as a manufacturing city. Five years ago Mr. Moon embarked in the automobile business in the same thoroughgoing manner that has distinguished him in other lines, and extended his name to his latest product—hence, the Moon automobile, which was not long in making its title as well known as the other products for which its manufacturer has stood sponsor for many years past.

Houdini Enmeshed with Chains Ready for His Test.

HOUDINI GIVES WEED CHAINS A TUSSELE.

Harry Houdini, the "Handcuff King," went up against the Weed Chain Tire Grip Company's product at a New York vaudeville show last Friday night. Representatives of the company enmeshed the slippery gentleman in a flesh-cutting network of chains, embracing subsidiary loops, added a couple of chains, bound automobile wheels to the combination, and fastened the whole with padlocks, after laying Houdini on his back. The "Handcuff King" had a long struggle of it, but finally emerged from his cabinet, freed of his bonds, victorious.

A RIDE FOR ATLANTIC CITY OFFICIALS.

ATLANTIC CITY, N. J., April 13.—Members of the Atlantic City Automobile Club have been called upon by its officers to furnish 30 cars to carry the Board of Freeholders and prominent city officials on a day's tour of inspection of the roads, with a view to an intelligent and appreciative appropriation of the funds for highway improvement. The precedent set by the local club is one that might be followed to advantage elsewhere.

INGENUITY OF A TIRE-MAKING PLANT.

DETROIT, April 13.—It is a mistake to imagine that the ingenuity of tire manufacturers is confined solely to the production of automobile accessories. In proof of this, the Morgan & Wright plant in this city has just completed one of the most unique jobs of its nature ever undertaken. Eighteen pairs of rubber gaskets for use between the tubes of the Michigan Central tunnel under the Detroit River here have been turned out, their purpose being to make the tunnel water tight.

Each of the gaskets is an endless piece of solid rubber, forming a circle twenty-four feet in diameter, and weighs 425 pounds. One side of the gasket is grooved to receive the end of a tube, the other side being flat to meet a similar ring on the adjoining tube. A gasket is run out in a continuous piece by a tubing machine having steel shaping dies. Then it goes to steel molds with a hydraulic pressure of 2,000 pounds to the square inch. The platens of the molds are hollow, and the gasket is vulcanized and the ends joined as it goes through. Three days are consumed in turning out a single gasket.

They also Make 24-foot Gaskets at Morgan & Wright's.

BRIEF ITEMS AND TRADE MISCELLANY

The Chelsea Clock Company, 16 State street, Boston, Mass., announce that their factory and warehouses were not damaged by the recent conflagration which destroyed so large a part of the city of Chelsea, Mass.

The Bergdoll Motor Car Company, of Philadelphia, officially opened its big new establishment at Broad and Wood streets last week with a banquet to the press and trade. Upwards of 150 guests were present.

Z. E. Danner, formerly of the Commonwealth Power Company, Allegan, Mich., and J. W. Reek, formerly of Hillsdale, Mich., have formed a partnership and opened a general garage, supply and repair business under the name of the Angola Automobile Garage, in the Hendry Block, Angola, Ind.

Jacob W. Mason, one of the best-known and enterprising dealers in New Jersey, formally opened his new garage at 350-352 Halsey street, Newark, on Saturday afternoon and evening, April 11. There was music and refreshments; also a full line of Maxwell and Stoddard-Dayton cars, for which he is the Newark agent.

A company has been incorporated in Los Angeles to operate a taxicab service. The concern will be known as the Taxicab Company, its incorporators being Frank J. Spare, J. A. Murphy, M. G. Yoakum, W. J. Wren, and Donald Barker. Orders have been placed for three cars, and the company expects to have 25 in operation in the next few months.

Mrs. Florence Moore, of Seattle, Wash., sailed for Japan March 31, and in the hold of the steamship was her Winton roadster, in which she will tour Japan for two months, after which she will visit China for a tour of three months. Aside from Mrs. Charles J. Glidden, Mrs. Moore is the first American woman to undertake a journey of this nature.

There will be established at Coney Island for the accommodation of automobilists a commodious garage opposite the new Steeplechase, on the block bounded by Surf and Mermaid avenues, West Sixteenth and West Seventeenth streets, by George C. Tillyou. The garage will be able to accommodate 1,000 cars, and will probably be the largest of its type in the world.

Max Grabowsky, one of the founders of the Rapid Motor Vehicle Company, has organized the Grabowsky Motor Car Company. The new concern will have its headquarters in Detroit, and will manufacture a new style of motor for commercial and sight-seeing cars. The entire power-plant will be made removable, to that it can be taken from the car without disturbing any other part.

As an evidence that the Wayne Automobile Company of Detroit has an abiding faith in the future of the industry, it may be cited that the last of a series of contracts for new machinery, to the extent of \$100,000, were signed last week. The first of these new machines, a mammoth drill press, was received last week, and a number of other special pieces of machinery are being set up. President B. F. Everitt is now on an extensive Western tour, visiting the company's agencies.

The United States Navy Department has purchased two automobile ambulances from the White Company, of Cleveland. One of these is for use at the Naval Hospital at

Philadelphia, and the other at the Tuberculosis Hospital at Las Animas, Colo. The new ambulances are similar to those which have been purchased from time to time by the War Department from the White Company. The chassis of the two new ambulances are identical with those of the standard 30-horsepower White touring cars, except that the frame is lengthened out, increasing the wheelbase to 132 inches. The new ambulances have a capacity of four stretchers, besides accommodations for several surgeons, and space for carrying a considerable quantity of medical supplies.

The Mora Motor Car Company, Newark, N. Y., will shortly commence moving into its new plant, but as the whole force is working under considerable pressure at present it will probably be 60 days before the transfer is completed. The first main building, measuring 60 by 406 feet, and

How the Jones Decorated.

One of the most artistic yet simple decorations for New York Carnival Week was that of the Jones speedometer, whose New York headquarters are at the corner of Broadway and Seventy-sixth street.

which is two stories high of mill construction with full skylight, has been completed, as have also the boiler and testing houses. The ground floor of the large building will be entirely devoted to machine work, each department being supplied with power by an independent motor. The second floor will house the company offices, drafting rooms, and the painting and upholstering departments. The machine tool equipment of the old plant is only two years old, and is the best obtainable. With the large additional quantity that has been ordered, and some of which is already on the ground, the company will have double its present facilities. The site of the new plant comprises a plot of seven acres, situated on the Northern Central Railroad. The testing house is complete in every detail, doors the entire length of the building permitting cars to be driven in and out freely. Five pits have been installed, and automatic ventilators supply them with fresh air and carry off the gas. Wash racks are provided, and all cars will be cleaned by steam.

NEW AGENCIES ESTABLISHED.

Bert S. Morley, Abbott and Seventh streets, Detroit, has secured the Michigan sales department of the Ferro Foundry and Machine Company, of Cleveland, and is arranging for additional lines.

The Auburn Motor Car Company has just opened salesrooms at 441 North Broad street, Philadelphia. The new concern will handle the Auburn, and will be under the management of F. Liebfeld, Jr. and H. W. Trump.

John J. Gibson, of the Buffalo Automobile Exchange, has taken the agency of the Pope-Hartford car, and will handle it in connection with the Franklin. The Pope agency was formerly held by the Imperial Motor Company.

The Hamilton-Kull Company, 1677 Broadway, New York, has just taken the agency for the Oakland Motor Car Company's output in the eastern territory. The Oakland company is a branch of the Pontiac Buggy Company, Pontiac, Mich., and has been building popular-priced runabouts and taxicabs for about a year past.

The Grout Automobile Company, of Orange, Mass., has established its agency in Boston with Stade & Farrow, who have opened a store at 94 Massachusetts avenue, for the sole purpose of handling the Grout car. Mr. Farrow is an experienced automobile man and handled the Grout in Cambridge, Mass., last year, and Mr. Stade is a well-known business man of wide experience.

The Dow Portable Electric Company, of Braintree, Mass., announces that hereafter the company's entire product will be sold through the George Q. Hill Company, Boston. There will be no change in the local representation, which will remain as at present, viz: New England States, W. J. Connell, 36 Columbus avenue, Boston; Middle States, The Factory Sales Corporation, 235 Randolph street, Chicago; Pacific Coast, L. H. & B. I. Bill, 132 Valencia street, San Francisco.

RECENT TRADE REMOVALS.

The Tinch Motor Car Company, South Bend, Ind., has removed its Chicago branch from the Chicago Automobile Club building to 1220 Michigan avenue.

The Triumph Gear Company, Incorporated, formerly the Motor Parts Manufacturing Company, Detroit, has removed from Sixth and Congress streets to Seventh and Abbott streets, and will devote its entire factory to the exclusive manufacture of marine reverse gears.

PERSONAL TRADE MENTION.

H. L. Thuma, formerly connected with the Imperial Garage, has been appointed general manager of the Columbus Garage & Machine Company, 35 West Mound street, Columbus, O.

R. D. Willard has resigned from the Harrolds Motor Car Company, metropolitan agents for the Pierce Arrow cars, and has gone with the Harry S. Houpt Company, agents for the Thomas.

Louis P. Mooers has left the Moon Motor Car Company, of St. Louis. He has completed designs for a popular priced car which, it is reported, will be manufactured by a new company soon to be formed.

W. M. Perrett, who until recently looked after the Diamond Rubber Company's interests in Detroit, will take charge of a branch of the Empire Automobile Tire Company, to be established there May 1.

Frank H. Yerger, who has gained considerable fame as a driver of the Studebaker on road and track during the past year, has been appointed manager of the Philadelphia branch of the Studebaker Company.

Edward H. Stickels, who has been connected with the Winton and Aerocar companies in New York City, has become connected with the Carlson Motor & Truck Company, 481-487 Sterling place, Brooklyn, as secretary and general manager.

W. H. Workman, of the Packard Motor Car Company, was scheduled to deliver at the Long Island Automobile Club last night an illustrated lecture, entitled "Through Darkest Cuba," setting forth adventures of the Packardians on their 1908 model try-out trip through the Island last January.

E. C. Morse, general sales manager of the E. R. Thomas Motor Car Company, is spending the week in New York City as the guest of Harry S. Houpt, the New York representative of the company. Mr. Morse expresses himself as well pleased with the present condition of the automobile industry.

George Parker, a prominent driver and salesman, has joined the corps of experts which the Bergdoll Motor Car Company is gathering together to man its new salesrooms, garage and repair shop, at Broad and Wood streets, Philadelphia. Parker will probably act as Mr. Bergdoll's mechanic in the Briarcliff race.

New York Renault Branch.

This new garage, spare parts, and taxicab department of the Renault Frères Selling Branch has just been opened at 214-216 West Sixty-fifth street, New York City.

NEW TRADE PUBLICATIONS.

Matheson Motor Car Company, Wilkes-Barre, Pa.—An unusual amount of attention has been devoted in the Matheson catalogue for 1908 to showing the essential features of the mechanism and describing its salient features in a clear, everyday, matter-of-fact manner, so that the average owner of a Matheson can recognize them at a glance and realize their method of operation and their importance in the economy of the car as a whole. Every important part of the car has received this same painstaking attention, and is attractively illustrated by half-tones so that the design and construction of the car may be studied in detail without trouble. The book is prefaced with a list of the Matheson agents in various parts of the country, followed by an introductory outline of the Matheson and several pages of half-tones showing the complete cars, while at the end a list of the many victories to its credit are given, together with a few letters from satisfied owners, under the significant heading, "One Hundred Per Cent. of Satisfied Customers."

Charles E. Miller, New York City.—This house is now sending out its tenth annual catalogue. It is a book of 216 pages and cover and probably contains more information regarding auto supplies and accessories than anything of the kind ever published. It is such a compendium in fact, that it has come to be known as "Miller's Blue Book of Auto Materials." In this latest catalogue, Mr. Miller lays particular stress upon the fact that the list prices scheduled therein are those given by the manufacturers of the articles, and are standard, and that none of the so-called bargain houses can give large discounts from them. It would be impossible to even give a resumé of the long list of articles catalogued. As the compilers put it, "We either carry it in stock, will get it, or it isn't made," which suffices to tersely sum up the matter where the question of thoroughly covering the ground of automobile supplies and accessories is concerned. Copies will be mailed gratis upon request to all applicants.

Neustadt Automobile and Supply Company, St. Louis.—This firm's mailing representative for 1908 is a book of 188 pages, of large size, bound in yellow covers, with a bright red band across the center, on which the firm's name is printed. Above this is the title, "The Growing House," as, in addition to the headquarters at 3948-3954 Olive street, St. Louis, a branch house has been established at 368 Golden Gate avenue, San Francisco, to take care of the Coast trade. The book itself is replete with a most complete showing of running gears, motors, transmissions, parts and accessories, all of which are of well-known standard makes. In fact, there is everything for the automobile and motorboat that can possibly be imagined and that covers a range of articles much wider than the average autoist has any idea of.

Lozier Motor Company, New York.—Under the title of "Lozier Logic" the publicity department of this concern has decided to issue a house organ which, as its head-line indicates, will be "published with more or less frequency and always on the square." It is an attractively made up booklet in small magazine form and is "in the perpetual interest of the Lozier motor car," after which it is hardly necessary to add that it is filled with Lozier, first, last and all the time, but so interestingly presented that the reader forgets he is reading a periodical catalogue. The frontispiece shows the "Peerless One," W. J. Bryan, in a Lozier, while the remaining twenty pages are generously interspersed with attractive illustrations showing Lozier cars in recent events and competitions.

Haynes Automobile Company, Kokomo, Ind.—It is one thing to compile a catalogue and quite another to make it a piece of interesting reading, though it is evident at a glance that this object has been attained in the case of the new pamphlet just received from the makers of the Haynes cars. The Haynes Company is, by the way, now entering upon the fourteenth year of its manufacturing career so that the preliminary "argument" which prefaces the story of the 1908 Haynes cars is well worth reading. The booklet deals briefly with each salient feature of the Haynes design and construction, the parts being attractively illustrated. In fact, the whole catalogue is a business-like presentation of the maker's claims for superiority that is well-dressed typographically.

Jackson Automobile Company, Jackson, Mich.—"Jackson motor cars need no introduction to the public," say the makers, "as this is their seventh season." Accordingly they confine themselves to a brief description with a single illustration of each model, the catalogue being prefaced with an attractive frontispiece showing a landscape in col-

ors, a Jackson car at full speed occupying the foreground. Following the brief descriptions of each model for the coming season, which are accompanied by half-tone illustrations and set off by attractive headpieces in colors, there are two pages of views of the mechanism of the cars, three pages of the "Winnings of Jackson Cars," some testimonial letters and a page of illustrations of the various trophies won.

Haschke Storage Battery Company, Chicago.—"Facts—Real, Certain, Undeniable Facts, Concerning the Haschke Storage Battery," is the title of the opening page of a booklet being sent out by these makers of accumulators for light, power and automobile use. The pamphlet is only one of 16 pages and cover, but within its covers, the front one of which bears the significant quotation "fool proof," is condensed a great deal of information about the Haschke storage batteries. Nor is it all balled down facts, as the text matter is relieved by occasional half-tone illustrations showing the application of the batteries.

Mora Motor Car Company, Newark, N. Y.—In presenting its trade literature to the automobile-buying public for the coming season this concern goes into the whys and wherefores of the "Six vs. Four" problem and shows why it was convinced that the additional cylinders were an advantage, although the Mora four for 1907 was an unusually successful car. The catalogue attractively illustrates and describes each different type turned out, as well as a large number of the essential parts of construction, showing their design.

Goodyear Tire and Rubber Company, Akron, O.—Under the title of the query, "Are You Getting Your Share?" this company is sending out an interesting little sketch written in the vernacular and describing the experience and views of the driver who did not have Goodyear equipment, with those of a second chauffeur who stops to see if any assistance is required by the man who is struggling with a tire that has given up its life for the time being.

American Gasoline Motor Company, Baldwinville, N. Y.—This firm makes a specialty of supplying castings and machined parts of two-cycle motors to be built by their customers, and is sending out a pamphlet describing the various types and sizes offered, as well as the numerous accessories necessary to build the complete motor and install it in a boat, the motors being of the marine type.

Pope Motor Car Company, Toledo, O.—The distinguishing features of Pope-Toledo automobiles are well presented in the firm's 1908 catalogue just received. Three large illustrations of the Pope-Toledo touring car, limousine and runabout give an excellent idea of the company's lines. The get-up of the catalogue is of the highest class.

Hatfield Motor Vehicle Co., Miamisburg, O.—What can be obtained for an expenditure of a little over half a hundred dollars is attractively put forth in the 1908 Hatfield Buggyabout catalogue. The high-wheeler has its features well backed up in the catalogue and is thoroughly illustrated in detail and as a unit.

The Angler Company, Boston.—Very little that is in any way connected with automobile equipment has been omitted from the 1908 supply catalogue of the Angler Company, Boston. Everything from cotter pins to magnetos is described, illustrated and priced in the New England publication.

Northwestern Storage Battery Co., Milwaukee, Wis.—Storage batteries for automobile use and illuminating purposes receive the major portion of attention in this firm's recently published catalogue. Other lines handled and described are charging outfits, electric lamps and electric searchlights.

Moon Motor Car Company, St. Louis, Mo.—"Simplicity" is taken as the keynote of the Moon automobile, described in the 1908 catalogue. To show how the car excels in this respect numerous illustrations are given of various parts of the engine and transmission.

Pope Manufacturing Co., Hartford, Conn.—"Held High in Public Esteem" is how the testimonial handbook of the Pope-Hartford is presented. Usual methods of catalogue compiling have been departed from in this work, with very pleasing effect.

The Bartholomew Co., Peoria, Ill.—"Why I Bought the Gilde" is a satisfied customer's account of the reasons which induced him to invest in the machine from Peoria. The story is told in a little booklet printed in colors.

Motor Car Equipment Co., New York.—Two thousand articles are illustrated, described and priced in the 1908 catalogue of the Motor Car Equipment Company, Warren street, New York.

INFORMATION FOR AUTO USERS

Diamond Repair Block.—This has just been placed on the market by the Diamond Chain & Manufacturing Company, Indianapolis, Ind., and it has proved so successful that it promises to make a riveted chain easier to repair than one of the detachable type. It is smaller than any tool ever

THE NEW DIAMOND REPAIR BLOCK.

brought out for the purpose and takes up but a very little space in the tool kit. By placing the chain in the block as shown in the illustration, and giving both rivet heads a light tap with the hammer, the side bar may be lifted and the repair link inserted, making the chain ready for use again in a minute or two, while the whole operation of taking the chain off, repairing it and putting it back again need not take more than ten minutes. If it is desirable to use the old link again, it is only necessary to put the link and side bar back into place and flatten out the two rivet ends with a hammer. It is a speedy means of repair that will be appreciated by owners of chain driven machines.

Time Saver Tire Plug.—This is a novelty recently placed on the market by the Auto Time Saver Repair Kit Company, 178 Devonshire street, Boston, Mass. With its aid it is possible to repair inner tubes

TIME SAVER PLUG.

permanently without the aid of vulcanizing apparatus, rubber patches, or cement. It consists of the rubber plug shown, which is first inserted in the puncture, and then firmly compressed by means of a pair of pliers as shown in the cut illustrating the operation. This grips the rubber around the hole and closes the puncture permanently. The Time Saver plugs are made of two circular brass discs, joined by a

TIME SAVER PLIERS IN USE.

solid post 3-16-inch long. The discs are grooved, so that when clamped together, they hold the rubber securely. The solid post does not collapse, but remains intact, furnishing ample support for the pressure of the discs against the rubber so that there is no possibility of the discs becoming separated. The entire plug, being rubber-covered, presents a surface similar to

that of the inner tube. The special Time Saver pliers used for the operation, have circular washers attached to the jaws, the lower washer being perfectly flat so that it cannot cut the rubber, while the upper washer is made convex. The Thomas car in the New York-Paris run has been supplied with Time Saver plugs.

Monster Gasoline Gages.—One of the most striking accessory exhibits at the recent Boston show, was that of the Boston Auto Gage Company, which exhibited some monster gasoline gages, 11 feet in length, made especially to the order of a large dyeing and cleansing establishment in Philadelphia. The gage is known as the Triumph, and that its success is already a well-established fact is quite evident from its adoption by no less than eleven different manufacturers of high-grade American cars, on which it will be regularly included as a part of the stock equipment. The "Detachable Second" gage, which is used by the George N. Pierce Company, Buffalo, N. Y., on all the 1908 Pierce Arrow cars, is another one of the products of the Boston Auto Gage Company, and its presence on a car is highly appreciated by an owner or driver.

Universal Tire Protector.—Briefly described, this is an armored sleeve with a positive mechanical anchorage, which is being placed on the market by the Universal

UNIVERSAL TIRE PROTECTOR AND ANCHOR.

Tire Protector Company, Angola, Ind. The inventor of the Universal, having experienced the forms of tire trouble common to all autoists, has endeavored to bring out a combination having a positive mechanical anchorage, that shall be practically instantaneous in application, adjustment and removal, unyielding to the hardest usage, and universal in its application to all makes and sizes of tires, shapes of felloe and rim construction. It has only been after putting it to the most severe practical tests that it has been put on the market. The Universal Tire Protector is made of chrome leather specially selected for this purpose, and is equipped with a reinforced steel armored tread of special construction. Patent steel draft hooks and side plates produce perfect conformity to the shape of the tire. There are no lacings nor buckles, and only one small wrench is necessary to attach or release the fastening which holds the Universal where it is put, the operation requiring but a very short time.

Gre-Solvent.—Ever get your hands grimy? Every man who takes care of his car or motorboat, and what owner does not prefer to do so when he has the opportunity, cannot fail to get a liberal coating of grime and grease on his hands, and it is of the kind that resists all attempts

to remove it in the ordinary manner. For several years Gre-solvent, which is "miles ahead of soap," has been the friend of the man whose hands have become soiled through working around machinery. The quality of this cleanser has always been of the best, and this year, the manufacturers—the Utility Company, 332 Broadway, New York—have increased the size of the package, giving a much greater quantity without increasing the price or lowering the quality.

Quick Tire Wrench.—Any autoist who has tried to take off the lugs of a clincher tire in a hurry realizes that the process is one in which quick time cannot be made with the appliances ordinarily used for the purpose. To make this possible, John Kelly,

THE QUICK TIRE WRENCH.

Congress street and Forty-sixth avenue, Chicago, has brought out what he terms the "Quick Tire Wrench," which is illustrated by the accompanying line cut. It is an ingenious little device designed to be slipped over the lug cap until it engages the square part of the shank of the lug. By having the string wound up left-handed, the lug may be removed by a single pull, while to reset it, the string is wound in the opposite direction. The maker claims that it is possible to save half the time in tire changing with the aid of the Quick Tire Wrench. It is made in three sizes, 1-2-inch, 5-8-inch and 9-16-inch.

Ideal Automobile Switch.—More batteries and coils have been condemned as the result of a poor switch than the recording angel could possibly take account of. The ordinary types of switches in common use when the automobile came upon the scene were not adapted to its use owing to the vibration and hard service to which they were put. Between constant shaking and the presence of dirt and grease they did not give a satisfactory contact for very long. To overcome these defects the Ideal

IDEAL AUTOMOBILE SWITCH AND PARTS.

Switch Company Inc. Plainville, Conn., brought out the type shown in the accompanying illustration. The blade is removable for safety and when in position gives a positive and clean contact; it cannot jar out of place owing to the construction of the spring contact posts which are self-locking. With the blade in the vertical position as illustrated, the switch is in the off position while turning to the right, or left, gives the magneto or battery connection, as desired.

desirous of discontinuing their trips to Philadelphia, or to the many places of interest lying to the south and west of that city, such as Baltimore, Washington, Gettysburg, the Shenandoah Valley, and the National Highway. It is obvious that the solution of this problem lies in making the trip between New York and Philadelphia without entering the State of New Jersey. That such a trip is possible, is evident by a glance at the map accompanying this article. But the desirability of such a route, the mileage, and other features, were matters which could only be determined by an actual tour of exploration.

first proceeded to Tarrytown. Here we were ferried across to Nyack, on the opposite shore of the Hudson. This is the only ferry on the new route, and should be compared with three ferries on the Staten Island-Trenton-Camden route, and two ferries on the route via Newark. The ferry at Tarrytown, it should be remarked, runs on practically an hourly schedule. Tourists starting from New York in the morning should make connections with the boat that leaves at 10:10 or at 11:10. The fare for car and passengers is \$1, and the ride is a pleasant one. From Nyack, we continued almost due west to Suffern, and

Typical Country Road Leading to Richmond, Penn.—One of the Many Picturesque Stretches of the Route.

Picturesque Waterfall at "The Gap."

Seen on the Road Leading to Port Jervis.

here we struck the main route, which leads northward from Jersey City to Newburgh and other points on the west of the Hudson river. We followed this route through the beautiful Ramapo valley, passing Tuxedo and Southfield, and then proceeded over "Harriman's private road" through Arden to Turner. Here we turned off from the main north-and-south route, and struck out toward the west. The splendid roads which we had hitherto encountered continued without interruption, and we made quick time through Chester and Goshen to Middletown, this part of the route leading through a delightful rolling farming country.

We had anticipated that on the next stage of the journey we would have some very bad roads, particularly in view of the recent heavy rains. Just beyond Middletown we inquired of a lady what kind of a road we would have to Otisville, the next town.

White Steamer at the Famous Delaware Water Gap.

"It is a lovely road," she answered, and "lovely" it proved to be—smooth, hard, well drained, and in every respect ideal. At the next little hamlet, Huguenot, we stopped a moment to exchange greetings with the postmaster. "Fine roads you have around here," we exclaimed. "Well," he replied, cautiously, "they will be when we get all the stones raked off." Such commendable fussiness! We had not noticed that there were any stones on the road. No wonder that there are good roads in that section! They are not State roads, by the way, but have been built and are kept in repair by the local communities.

The fine roads continued, and we drove into Port Jervis over as fine a straightaway as any racing driver could wish for. We did not see any hotel at Port Jervis which looked attractive, and, therefore, we kept on our way. We crossed the iron toll bridge over the Delaware river into Matamoras, in the State of Pennsylvania. Then commenced our ride down the valley of the Delaware. I doubt if more beautiful scenery can be found in any section so near to New York, barring, of course, the Hudson river scenery. On one side of the road, the Delaware river

flows lazily on its way, sometimes close to the road, sometimes a half mile away. On the other side of the road rise towering cliffs, strongly suggestive of the Palisades and doubtless of the same geologic origin. Far on the left may be seen the inhospitable hills of New Jersey. All things considered, the scenery is decidedly distinctive.

Eight miles below Port Jervis we came to the town of Milford, and here we decided to spend the night at the very comfortable Milford Inn, which is one of the large number of summer hotels for which the place is distinguished. Milford, by the route which we followed, is 104 miles from New York. We had crossed the Tarrytown ferry at 11:10, had stopped off an hour for luncheon and frequently for short intervals in order to inquire our way, yet we were at Milford before 6 o'clock. It is thus evident that the roads are of a kind which permits rapid traveling.

Starting from Milford the next morning our route again lay along the Delaware river, the scenery being much the same as that between Port Jervis and Milford and the road almost equally good. However, there are numerous sharp turns on the narrow road, suggesting cautious driving and the frequent tooting of the horn. Thirty-three miles below Milford we reached the famous Delaware Water Gap. I will not attempt to describe this great natural curiosity. All travelers by the "Road of Anthracite" await expectantly for the fitting view which can be obtained from the car windows—and then when they return home they declare that they have seen "The Gap." To all those people, to Phoebe Snow and her fellow-travelers, I say, "Go to 'The Gap' in an automobile, as we did, and drive through it close to the water's edge, stopping at each bend in the road to take in the wonderful vista, and then—and not until then—you may truthfully report that you have seen 'The Gap.'"

Five miles below "The Gap," at the town of Portland, the road leaves the river and then come ten miles of road which are distinguished by water-breaks, the first seen on the trip. At Martin's Creek the road again comes back to the river edge, and there is a fine eight-mile stretch of macadam into Easton. South of Easton there is a stretch of about twelve miles where the road again follows the Delaware river. Then the road again bears inland. On either side of the town of Ottsville we encountered some very rough roads, which are still in much the same condition as they were on the first of January, when twenty-two of twenty-eight touring cars competing in the Quaker City Motor Club endurance run failed to maintain a schedule of twenty miles an hour over this section of road. As we neared Doylestown the good roads began again, and thereafter we had a fine macadam highway through Hatboro, Willow Grove and Jenkintown into Philadelphia, entering the city by the way of the York road and North Broad street.

Beautiful Country Near Turner, Miles of Which Abound.

The total mileage to Philadelphia is 225 miles, the easiest kind of a two-day trip, and infinitely more interesting and varied than the usual one-day trip across the State of New Jersey. Moreover, the tourist who follows our route has the satisfaction of knowing that he has signed the new Declaration of Independence—independence of a State in which, on June 1 next, there goes into more costly effect a motor vehicle law which outrages the sense of justice of those tourists who ask for nothing more, and who are satisfied with nothing else than a square deal in the use of the public highways.

It will be remembered that one of the most notable clashes which ever took place between the advocates of sane motor vehicle laws and those who favor radical restrictions occurred at the banquet of the New Jersey Automobile Club in Newark last February. The leader of the progressives was Judge Hotchkiss, president of the A. A. A., while on the other side were arrayed Governor Fort and Senator Frelinghuysen. Judge Hotchkiss argued for the recognition of licenses granted in other states, and he ridiculed in masterful fashion the power-of-attor-

Fine Road to Middletown Stretches Away In the Distance.

Crossing Old-fashioned Canal Bridge.

ney clause and other obnoxious features of the bill which has since become a law. The New Jersey officials took the ground that their state, being located between two great centers of population, was entitled to heavy tribute from those who used the roads in traveling between New York and Philadelphia, and they intimated that, no matter how vigorously automobilists might denounce the law, they would nevertheless have no way of avoiding contribution to the State treasury, or of escaping the other

doubt that a decreased revenue from the automobilists, when an increase is anticipated, will be a much more potent argument with the State authorities at next year's session of the legislature than would any plea based on justice or on reason.

If the route which I have described above led over bad roads or into a country not well supplied with hotel accommodations, I might hesitate to recommend it as a substitute for the usual New Jersey route. But the attractiveness of the new route is such that, even were all questions of State laws laid aside, I would recommend it as one of the best two-day trips leading from New York or from Philadelphia.

ADVERSE DECISION IN INDIANAPOLIS.

INDIANAPOLIS, IND., April 20.—Judge Henry Clay Allen of the Marion County Circuit Court has decided that the city automobile ordinance, which has been in force for several years, and which provides an annual license fee of \$3, is valid and does not conflict with the State law. Unless the case is carried to the

Conveniently Located Prison in Fashionable Milford, Pa.

provisions of the law. It was the old question of "What are you going to do about it?"

To the autoist, resident in New Jersey, there is, unfortunately, no escape; but it is evident from what has been written above that the automobilists of Philadelphia and of New York who, under the present statute, contribute such a large share of the license fees collected in New Jersey, will be able to omit the State altogether from their touring calculations. There is no

How to Avoid Going Through Darkest Jersey.

Supreme Court, which has not yet been decided upon, this closes a case which has been fought hard for almost one year.

Judge Allen holds that the ordinance does not conflict with the State law, as the former is for revenue purposes only, while the State law is a police regulation. Some 900 owners have been waiting to pay their 1908 license, and City Controller Bracunig announces this fee must be paid at once or arrests will follow.

OHIO'S UNIFORM LAW HAS GOOD CHANCE.

CLEVELAND, April 20.—Although for a time it appeared as though the Motor Vehicle bill introduced into the Ohio Legislature was doomed to die an untimely death, there now seems a chance for it to pull through, after all, even though amended somewhat. Secretary Forbes of the Cleveland Automobile Club is spending some time in the capital city these days in an effort to advance the measure, and he writes that he has a fair chance of being successful.

Following the Beautiful Delaware River.

Comte de Vogue's "Panhard-Levassor," Winner of the Championship of the Sea, at Monaco, with Average Speed of 33 1-3 Miles per Hour.

STORY OF MONACO'S ANNUAL AUTO-BOATING CARNIVAL

MONACO, April 16.—Every year some one event stands out at the Monaco motor boat meet overshadowing all others by its importance. The fifth annual meeting, organized by the International Sporting Club of Monaco, with a prize list of \$20,000, may be taken as an exception, in view of the fact that, instead of one, there were three conspicuous happenings. The Britishers won a victory over France and Italy by the remarkable performance of the *Wolseley-Siddeley*, the powerful racer specially built to wrest speed honors from the American *Dixie*; Italy suffered the loss of the *Fiat-Gallinari*, destroyed in a few brief seconds by fire; and France obtained her revenge over the Union Jack by winning the Championship of the Sea, distance 124 miles, at an average speed of 33.13 miles an hour.

Britain scored her substantial victory the second day of the meeting in a 50-kilometer race for boats of unlimited power. In a calm sea, the English boat covered the distance in 51:17, being an average of 33.28 miles an hour, beating *Panhard-Levassor* by nearly seven minutes and completely walking away from the Italian *Jeanette*, the *Lorraine*, and Brasier's *Grand Trefle*.

On the start being given, *Panhard-Levassor*, piloted by Comte Robert de Vogue, got away first, followed by the English *Wolseley-Siddeley*, the *Lorraine*, and the *Jeanette*, Vincenzo Florio's boat, engined by Itala. The *Grand-Trefle*, Brasier's craft, having been in collision a few hours before, only got away a minute and a half after the others had left. During the first round, the French and English boat raced neck and neck, rounding the home buoy close together, amid intense excitement. Gradually, the Britisher forged ahead, and at the end of the second round was fully 200 yards ahead of the *Panhard-Levassor*. The lead was gradually increased, Britisher and Frenchman running with perfect regularity, until at the end of the eighth round the *Wolseley-Siddeley* had a lead of 2 minutes 13 seconds on its rival. The *Jeanette* went through to the end, finishing rather more than four minutes behind the winner. The *Lorraine* abandoned during the fifth round, and the *Grand-Trefle*, with her three Brasier motors, went out of business before the end of the fourth round.

Particular interest attaches to the *Wolseley-Siddeley*, from the fact that she has been built by Saunders and engined by the Wolseley Company with the express purpose of regaining the international cup, now held by the American *Dixie*. The boat is 39 feet 4 inches over all, 6 feet beam, and has a maximum draught of 32 inches. Her power plant consists of a couple of eight-cylinder engines, rated at 200-horsepower each. The makers, however, refuse to announce the bore and stroke. The two motors are mounted side by side with a slight outward list, in order to give a little more room for the movement of the

mechanics. The cylinders are cast in pairs, each pair being fitted with a very light screwed-on copper jacket. Valves are all on the inside, and do not present any particularly interesting feature, with the exception of the welded steel water space over each water cap. The eight-throw crankshaft, with bearings between each pair of cylinders, and cranks of one group of four set 90 degrees ahead of the other group, is a remarkable piece of work. The centrifugal pumps on the forward end of each motor assure a circulation of cooling water, the exhaust pipes being water-jacketed near the engine, then carried aft into a 6-inch pipe, finally branching into two mufflers.

Ignition is provided by high-tension magnetos, completely encased at the forward end of the motor; high-tension coils are fitted as a stand-by in starting up. Total weight of each engine is 1,670 pounds. On the testing apparatus 207-horsepower was obtained from each motor at an engine speed of 1,000 revolutions per minute.

Championship of the Sea Won Thrice by Panhard.

Twenty-one boats, racers and cruisers, started in the Championship of the Sea, run over a distance of 200 kilometers, the fifth day of the meeting. On a perfectly calm sea, the *Panhard-Levassor*, *Rapier III.*, *Wolseley-Siddeley*, *Scarlet-Runner*, *Grand-Trefle*, *Labor*, *Lorraine*, *S. I. A. M.*, *Louis-René*, *Essembi*, *Mais-Je-Vais-Quand-Meme*, *Isabelle-Gnome*, *Lorraine IV.*, *Delahaye-Nautilus*, *Mors-Ulysse*, *Sec*, *Lolotte*, *Leman*, *Ricochet XVI.*, *Jeanette*, and *Mors-Calypto* got away in fairly regular order.

The "Wolseley-Siddeley" that Won the 50-kilometer Race.

At the outset *Panhard-Levassor*, *Rapriere*, *Wolseley-Siddeley*, and *Grand-Trefle* were looked upon as the boats that would set the pace. The British *Wolseley-Siddeley*, however, had to abandon almost at the start, owing to difficulties with the clutch of the port engine. The Italian *Jeanette*, which Vincenzo Florio was piloting, refused to be started up, and it was not until the first boat had a lead of 37 minutes that the amateur sportsman went away, determined to go through despite his handicap. The *Panhard* boat very early took a lead, and got so far ahead of the others that its position was secure from the first.

Brasier's *Grand-Trefle* and the little *Rapriere*, fitted with *Panhard* engines, supplied the sport in the fourth round. For four consecutive rounds the two French boats made a neck-and-neck race, the *Grand-Trefle* cutting sharp round the buoys and gaining at something each turn, only to lose it on the straight. The close struggle, watched with tremendous excitement by the mass of spectators on the terrace, came to an end by the *Grand-Trefle* shipping too much water, becoming heavier, and falling off in speed. The little *Rapriere* then forged ahead, while the *Grand-Trefle*, after covering two-thirds of the distance, ran for port.

Vincenzo Florio's boat, which had started out with the loss of half an hour, now found itself fifth, the boats ahead of it being *Panhard-Levassor*, *Rapriere*, *Delahaye-Nautilus*, and *Calypto*. The two latter, however, were only fast cruisers, and it was not long before the Italian had left them astern. Then one of those chances which are always to be looked for in a race allowed it to rush in and secure second position. The *Rapriere*, which is certainly a faster boat than the two-year-old Italian, had an irreparable accident to its machinery and had to be towed home. There was no further doubt as to the result of the race; Comte de Vogue piloted his boat past the winning post amid enthusiasm—for it is the third time the amateur pilot has won the Championship of the Sea—in 3:46:2, equal to an average speed of 33.13 miles an hour.

Panhard-Levassor, which because of its performance at Monaco without any preliminary tuning up worthy of the name, can claim to be of, if not the, fastest motorboat afloat, is fitted with four 120-horsepower 4-cylinder engines of about 7 1-2-inch bore, driving twin propellers. The lines of the hull are very closely modeled on those of last year's successful *Panhard* racer.

The last three days of the meeting were given up to handicaps, and the last event of all was a keenly contested struggle between France and Britain, in which the former was victorious. This last day stands out as the most important one of the whole meet. It began with matches between racers and cruisers of the different series having qualified in the long distance events.

After some finals for cruisers, of little international interest, *Panhard-Levassor*, *Wolseley-Siddeley*, *Delahaye-Nautilus*, and *Rapriere* lined up for the last and most interesting race of the meet, the standing mile and flying kilometer. One after the other, the balls dropped down the pole, and almost before the last one had reached the end of its course the British *Wolseley-Siddeley*, splendidly handled, had shot over the line and gained a few yards on its rival. It was a dead heat at the mile post. As the second post was passed, the Frenchman had got well ahead, the difference in time between the two fastest boats Europe has produced this season being 2 2-5 seconds. At an average speed of 34.67 miles an hour, the *Panhard-Levassor* had won the last Monaco race, and proved itself a faster boat than the one built by England with a view of capturing the International Cup, now held by *Dixie*. Tabulated, the result of the mile and kilometer record is as follows:

<i>Panhard-Levassor</i>	2:01 1-5	1:02 4-5	3:04
<i>Wolseley-Siddeley</i>	2:01 1-5	1:05 1-5	3:06 2-5
<i>Delahaye-Nautilus</i>	2:20	1:14 1-5	3:34 1-5
<i>Rapriere</i>	2:20 2-5	Disabled	

At the international nautical conference, which will be held in May, one of the most important subjects to be taken up is the creation of an international cup, somewhat on the lines of the Gordon Bennett cup, to be competed for annually by three or four boats per nation.

DELAGRANGE CHAMPION FLYER.

PARIS, April 15.—Leon Delagrangé has gone ahead of his friend, Henry Farman, by carrying the world's flying record to 2.43 miles in 6 minutes 43 seconds. It was a magnificent performance, witnessed by a small number of spectators on the Issy-les-Molineaux military ground, in the calm of last Saturday evening. Officials of the Aero Club marked out a triangular course by means of three flags. Circle after circle was described around the three fluttering yellow flags, the minutes lengthening out until 9:15 had been recorded by the timekeeper, at which moment the aeroplane gradually came to earth with its gasoline and water supply exhausted. Multiplying the dimensions of the triangle by the number of rounds made, Delagrangé's distance was 3.46 miles. On the first two rounds, however, the machine had slightly touched the ground on two occasions, owing to being too low for the curves, and official recognition was only taken of the distance covered since last leaving earth, which brought the record to 2.43 miles in 6 minutes 30 seconds, the longest distance ever covered under official control by a heavier-than-air flying machine. Farman's record, established March 21, was beaten in distance by 1.19 miles.

Delagrangé May Visit America.

NEW YORK, April 21.—As the result of the negotiations which are now being carried on by the Chicago Aero Club to have Farman's and Delagrangé's original machines, or duplicates of them, imported for the aeronautical congress to be held in Chicago July 2-4, Albert Triaca, chairman of the Aviation Committee of the Aero Club of America, announced last night at the meeting held at the club headquarters, 12 East Forty-second street, New York, that Delagrangé would probably soon visit this country.

Octave Chanute, the American pioneer in aerial flight, began the discussion of the evening, the subject of which was the raising of \$25,000, to be known as the American Aviation Fund. Peter Cooper Hewitt spoke favorably for the plan, as did also A. M. Herring, who is building a machine for the Government; Lee S. Burrige, Charles M. Manly, W. J. Hammer, Augustus J. Post, and Capt. Thomas S. Baldwin.

Rules for Michelin Aero Prizes.

PARIS, April 16.—Official regulations have been issued by the Aero Club of France for the two aeronautical prizes offered by the Michelin Brothers and totaling \$52,000. The two events, which are to be known as the Michelin International Cup and the Michelin Grand Prix of \$20,000, will be held under conditions only slightly modified from those first announced:

Michelin International Cup.—To become the property for one year of the owner of the flying machine which shall on the evening of the 31st December have covered the longest distance without touching earth. For the present year the distance must not be less than 20 kilometers (12.4 miles), around a circuit of not more than one kilometer, marked out by three or four flags. The winner each year will receive \$4,000 in cash, his club will hold the cup for one year, and the victorious flyer will be given a fac-simile. The winner the eighth year will receive \$4,000, and will retain permanent possession of the cup. If in any year the cup is not won, the prize money will be carried forward and added to that of the succeeding year. For 1909 and following years the distance to be covered will be modified by the committee of the Aero Club of France. Flights may take place in any country having a club connected with the International Aeronautical Federation. Entrance fee is \$20 for each day's attempt.

Michelin Grand Prix of \$20,000.—This prize will be given to the owner of the aeroplane which shall, before January 1, 1909, make the following flight with two persons on board: Start from any point in the Seine or Seine-et-Oise department, fly round the Arc de Triomphe at Paris, encircle the Cathedral at Clermont-Ferrand, and descend on the Puy de Dome, 4,806 feet above the level of the sea. Time limit will be six hours, the flight to be controlled by the Aero Club of France.

Wrights Reported to Have Sold Their Invention.

PARIS, April 16.—According to a report, which is circulating in Paris with considerable persistence, the Wright Brothers have succeeded in selling the secret of their aeroplane to M. Lazare Weiller for the sum of \$100,000.

SAN FRANCISCO, April 15.—When the word was flashed over the wire early on the morning of the first day of April that the Italian racer, the Zust, had left Los Angeles, and was making her way northward, the local Italian clubs and colony in general, the Automobile Club of California, and every enthusiast of the automobile, regardless of nationality, began to make preparations for the reception of the racer and her crew. The Automobile Club of California, through its representative, the writer, immediately set to work preparing a pilot car. Chevalier Rocco, the Italian Consul, and the Italian Touring Club had already appointed Armando Pedrini to carry the welcome, not only of the club, but of every Italian citizen, and to pilot them to this city. By noon, the big tourist car, carrying the Stars and Stripes on one side of her tonneau, and the royal standard of Italy on the other, flying small pennants of the Automobile Club of California at her head, sped down Market street and boarded the ferryboat for Oakland, as the run was made over the same route as that taken days earlier by the American Thomas until San José was reached. Here it was learned that the Zust had left Santa Barbara at 12:20 o'clock, and was on her way over the Coast route. From San José, the search was commenced, down the country road, through Edenvale, San Martin, Morgan Hill, and Madrone, to Gilroy.

Down the Picturesque Coast Route to Meet the Zust.

All along the way the flags were cheered, and the heart of many a son of Sunny Italy warmed as the standard of their royalty unfurled to their view. Many were the inquiries as to the time the car would be brought past that way. From Gilroy, the pilot car made its way to Salinas through San Juan, and over the grade so well known to autoists of California, bearing the name of San Juan Grade. The route is one of the most picturesque rides open to the automobile to be found in this part of the State. About a mile from San Juan the gradual rise commences, with small, easy grades at first. The road is fairly good, although it is made rough during each Winter by the vehicles which travel it in the rainy season and leave the imprint of the wheels and the horses' hoofs in the soft adobe mud, which is baked hard when the sun dries it up. Steadily climbing, one may look down into the cañons and valleys far below, which, in the late afternoon, are particularly beautiful in their lights and shadows.

Meanwhile a steady pace upward is kept. Around the side of the hill, with its grassy slope rising on one side high above and falling away on the other side into darksome ravines below, there intrudes occasionally a cold gray rocky bluff, enlivened at intervals by rock-lichen; then, again, it is a dense mass of trees and shrubbery, with every shade of freshest greens and brown, great bunches of wild lilac and honeysuckle, and the wicked, enticing beauty of the poison-oak. Slowly daylight deepened into twilight. The green freshness of the distant hills faded into deep purple, while their tops seemed to touch a sky painted in rosy tints of mauve and pink. A stop was made at the summit to take in and enjoy to the full the beautiful view. On one side lay the culti-

vated Santa Clara valley, with its miniature houses and cattle, resembling a set of Noah's Ark, and on the other the wild beauty of the hills and Upper Salinas valley. The descent was easy, and rapidly made, and it was but little after 7 o'clock when the pilot Tourist reached the garage in Salinas, where the stop was made for the night.

The telegraph wires were immediately put in use, and messages were sent to points along the line to find the travelers. After some little time, the word came that they were at Gaviota, and would spend the night there, and, after making a few repairs in the morning, would proceed northward. The next morning, Paso Robles was communicated with, and it was found that they had not arrived there, so a start was made for that place. From Salinas, the route lay down the Salinas valley, through Gonzales and Soledad, over the foothills of the San Lucia range, and on to Jolon. At Soledad, the message was received from Santa Maria, saying that they had passed through there; so a brisk pace was taken. For several miles the road lies in the bed of the valley, which is at present carpeted with wild flowers and the first shoots of the early crops. The foothills were soon reached, and, after a few small grades, the road leads through a beautiful natural park. The trees and shrubs are set almost symmetrically, on a smooth, green lawn, and, for a number of miles, it looks like the work of a landscape gardener. At Jolon, the telephone was again used, but nothing definite could be learned, and the pilot car and the White steamer, carrying the editor of *L'Italia Daily News* and several members of his staff, which had joined the Tourist at Salinas that morning, started on down the valley. The run was made then to Bradley, and another attempt was made to reach the Zust. This was more successful, as the message came back that they had left Paso Robles, and San Luis Obispo, and were going to try to make Gonzales. It was now about 9 o'clock, and as the Zust had some pretty bad roads to come over before they reached Bradley, where they would meet the pilot car, it was decided that the tired searchers should rest at the little hotel. I offered to stay on watch, and the rest of the party turned in.

In the Night Hours the Zust Was Greeted.

Seating himself in the tonneau of the Tourist, wrapped in a great coat, the watchman waited. The night was exceedingly balmy, but quite dark, as the little town lies in a valley, and the stars, although there seemed to be more than the usual number in the sky, shed very little light, and as the hours went past it grew colder and darker, and the silence was almost oppressive. In the distance could be heard the call of a night bird, or the bark of a coyote, or the more familiar one of a dog in some farmyard, but the whole world seemed to be wrapped in a blanket of darkness to sleep. Suddenly the alert ears of the watchman, who had been lost in revery, heard the throb and whirr of an engine, so foreign to the environments in which he sat, which he at first thought was a train passing over the track not far away. Listening more closely, the unmistakable chug-chug of

a motor was distinguishable, and his experienced ears knew it was the motor of a foreign make. The road lay around a bend, and soon the lights of the powerful lamps flashed, and he shouted, "All hands on deck!" In a moment the little hotel was alive, and the members of the party gathered, as the big travel-stained car, with her dusty, weary crew answered the shout of welcome. As the night was so far advanced, it being then about 1 o'clock, the racers decided to rest until morning, and, after much congratulation and many questions answered, the party again rested.

Enthusiastic Receptions at Every Hamlet.

At 4 o'clock the call was given to arise, and, after breakfasting and a minor repair made to the big Züst, the return run was begun. The morning was very cold, a heavy frost laying over everything, and, before starting, it was found advisable to take the cushions of the automobiles into the living-room of the little hotel and thaw them out. Back over the same route as was taken by the searching party on their way down, the Tourist led the big Züst. At every farmhouse, every roadhouse and every town, the little groups had gathered to greet the racers and to shout *bon voyage* to them as they sped past. At Soledad, a short stop of half or three-quarters of an hour was made for luncheon, and then the trip was continued. About a mile out of Salinas, the first car from San Francisco joined the procession, and the names of Sirtori and Scarfoglio were cheered, and the automobile fell into the procession. At Salinas, the citizens had gathered in the main street, and quite an ovation was given them here, flowers and Italian colors being thrown into the car. More automobiles joined the parade at this place, and the next relay of the run was made. Near Gilroy, the racer was met by the car of A. P. Giannini, containing Chevalier Rocco, the Italian Consul in this city; G. Pierano, the pioneer Italian of the State, and several other prominent men, and the big Packard fell into line. Gilroy was reached, and another big reception was tendered the heroes here; then to San José.

At this place the United Clubs of Italy gave the crew and the members of the pilot car a banquet, which lasted well into the evening. A number of speeches were made. Some of those who spoke were A. Pedrini, cashier of the Bank of Italy; S. Rocco, and G. Peirano. The remarks of the latter were most impressive, on account of the age of the speaker. Peirano is past eighty, but is still hale and hearty, with the clear Italian eye and a noble-looking head. He spoke to the crew, encouraging them to the end that they were aiming for, telling them to obtain victory, if possible, for the glory of themselves, their country, and their God. The entire party, the crew of the racer, and their friends, remained in San José for the night. The next morning, the last few miles were covered to Oakland, passing through Milpitas, Alviso, Haywards, and San Leandro. At each place more flowers were thrown and flags and bunting waved at the big grey car. The parade by the time it reached Oakland was several blocks long, and, on account of the crowd of cheering spectators, the cars proceeded slowly down Twelfth street to Broadway, and to the Creek boat, which carried them to San Francisco. Here the welcome was scarcely less enthusiastic than that given to the American car, and a cheering mob greeted the car at the ferry. Up Market street to Montgomery, out Montgomery to Montgomery avenue, along Montgomery avenue to Bay, out Bay to Van Ness the line of march lay. This is through the Italian quarter of the city, and every house that boasted a flag had it hanging from the window and waved from the doors or steps. The car was piloted to the St. Francis Garage.

Next Came the French De Dion.

Upon receiving word from St. Chaffray, of the French De Dion, that he was in Tulare, and would proceed northward on Monday morning, the 6th of April, over the same route as traveled by the American Thomas, as representative of the Automobile Club of California, I left in the pilot car, Stearns, for Los Baños. The De Dion reached Los Baños early on Tuesday morning, however, as it was necessary for the car to make a big detour

of the usual road between Fresno and Los Baños, on account of the flooding of some of the irrigation ditches. After a very short stop, piloted by the Stearns, the De Dion started for San Francisco.

After leaving Los Baños, the road lies for fifteen miles over rolling ground, and the pilot car had already found that a naturally worn road across fields was the best way to make the distance. This was the route taken, and the French car rolled along at an unusual rate of speed over the fields. Finally, the mouth of the Pacheco Pass was reached, and a little less speed was necessary, as through these valleys and up these mountains the road is very winding, making sharp turns and having steep grades. While on one of the highest and steepest grades, the cars met a team which did not like the appearance of these throbbing monsters, but before any one from the pilot car could reach them, St. Chaffray himself was at their heads, and led them past. This is, no doubt, what has won admiration and good wishes for the De Dion, rumors of which had long since reached California. Seeing several short cuts, the little low Stearns was tempted to take them, although in one or two cases they were exceedingly steep. It was found that the big De Dion was always there and ready to take these, notwithstanding her size and weight. "Old Glory" was everywhere to be seen intermingled with the tri-color of France, which gladdened the hearts of the travelers. All the little towns along the road had their crowd of cheering citizens, but the occupants of the car, as the distance between them and San Francisco grew less, were very impatient to reach the City of the Golden Gate. At San José a stop was made for luncheon, where La France Club had made preparations for a large banquet at the Lamolle House, but St. Chaffray, desiring to make the 4 o'clock ferryboat from Oakland across San Francisco Bay, spent about an hour here, then sped on to this city. When the city was reached, it was found that 160 miles had been traveled by the De Dion in the day. When asked their opinion of the roads they had come over, they stated that they considered that the roads of California were unusually good, and St. Chaffray said that those they had covered in the last day of their trip in California reminded him a great deal of the roads of France. On account of the lack of knowledge of the exact whereabouts of the De Dion and her crew, it had been impossible to make public the arrival of the racer in this city, so that there was no great crowd awaiting her at the ferry. The cars passed up Market street to Sutter, out Sutter to Van Ness, and thence down this avenue to the headquarters of the Renault selling branch, where the car remained until shipped.

The Motobloc has withdrawn from the contest, and will be sold in this city for a comparatively low price.

THOMAS CAR LEAVES SEATTLE FOR JAPAN.

SEATTLE, WASH., April 21.—Owing to their inability to have passports viséd by a Russian Consul, the Thomas crew was compelled to forego sailing on the *Glen Logan*, direct to Vladivostok, and left on the *Shawmut* for Yokohama, leaving this afternoon. E. R. Thomas is here to see his car off and made every effort to have the passports in due form, but the nearest Russian Consul is at San Francisco.

For the first time since leaving Buffalo, when the Züst had a slight lead, the Thomas finds itself in the rear, the Züst and De Dion having left for Japan last week, St. Chaffray being determined to sail, despite the protests of Lieutenant Koeppen and Sirtori that it was an unsportsmanlike thing to do. Sirtori has been re-engaged and he sailed on the *Glen Logan*, together with Lieutenant Koeppen and the Protos, though the latter's driver deserted. The Thomas will run across Japan to Tsuruga, taking a steamer thence to Vladivostok, and as the *Aiku Maru*, carrying the foreigners, was delayed at Victoria, the Americans may overtake them. The chances of the Thomas came near vanishing in the close escape from being wrecked that the *Bertha* had on the trip back to Seattle from Valdez.

SOME COMMONER FAULTS OF AUTO DESIGN

By A. H. DENISON.

AMERICAN manufacturers proudly declare that the design, material and workmanship in their cars is as near perfection as can be reached, yet troubles that may be traced directly to the design are occurring on high-grade and high-priced cars. The essentials of the motor and the transmission system usually have every care lavished on them, and the proper valve and ignition timing obtained by the use of costly and delicate instruments. The utmost attention given to those parts—the motor bearings, valve operating mechanism, etc.—in their design and development in the drafting room will not be of the slightest assistance to the operator who is “stuck” on the road with running gear troubles. Following the rule of tracing troubles from cause to effect, the *apparent* cause may be the loosening of a nut or bolt, or the character of the road being traveled.

The real cause of the trouble is “the work that particular part must perform, also the conditions under which it must labor and still do its work,” had not received sufficient consideration. It seems to be in minor details, where it would seem that particular care or experiment was not needed, occasionally rather important considerations overlooked, that

Where a Right-handed Screw Caused Trouble.

causes most of the trouble and expense to the unfortunate owner of that car. Reliability trials are very good in their place, but they would teach a great deal more if the cars entered had a thousand miles to their credit and were taken from their daily work instead of being tuned to the limit in the factory and then handled by the factory experts.

Some Typical Instances of Faulty Design.

The following are a few instances of where the lack of sufficient consideration in designing the parts referred to has been the cause of trouble. A big car came into the garage one evening and as the motor stopped someone called the operator's attention to a very bad leak in the radiator, the water being emptied in a very short time. An examination of the floor in the rear of the car showed that no water had been lost while the car had been running. The driver declared that he had not struck anything, and the appearance of the front of the car and radiator seemed to bear out his statement. The hood was raised and in the rear a stream of water could be seen issuing from a tube, the radiator being of the honeycomb type. This seemed to indicate that the end of a tube had opened. The radiator, when dismantled later, showed a gash about three-fourths of an inch deep, one inch wide and three inches long. On the motor, coinciding with the gash, was an idler gear driving the water pump and magneto.

The idler ran on a 1-inch shaft, secured to the motor base, and was lubricated with a grease cup. It was held on by a

3-8-inch flathead machine screw and washer about 1-4-inch thick and countersunk to receive the head of the machine screw. To prevent the movement of the idler affecting the screw a small dowel pin was driven into the shaft and the washer drilled to fit over it. (See sketch.) The dowel pin held things for about 2,000 miles. After the radiator was taken off and the front of the motor examined to find the cause of the trouble, the washer was found in the pan directly underneath the idler. It was recognized, the idler examined and both screw and pin were missing. Later the screw was found at the bottom of the pan. The motor, being right-handed, would turn clockwise. The idler, meshing with a gear on the crankshaft, would turn counter-clockwise, and the machine screw, having a right-handed thread, would, when turned counter-clockwise, back out. When the restraining influence of the dowel pin was lost the movement of the gear, carrying with it the washer, soon ran the screw out, though how it had the power of damaging the radiator so much is a question. The radiator was taken to the garage repair shop and though nearly three pounds of solder was put in it it could not be made water-tight and will probably have to be sent to the manufacturer. In putting the washer and screw back the dowel pin was changed so that it will be impossible for it to work out again, as the sketch will show. A thin cast aluminum guard covered the gears usually, but the driver, in order to tighten a troublesome stuffing-box that persisted in leaking unless a cupful of grease was forced into it at regular short intervals, had removed the guard that morning, and, being called in a hurry, had not stopped to replace it, as it was not necessary to the operation of the motor. It may sound very improbable, but, judging from the extent of the damage to the radiator, if the gear guard had been in place it would have been broken and with serious results to the timing gears.

Unprotected Gasoline Tanks Are Common.

On the following evening, after the same car came in, an odor of gasoline was noticed, and examination revealed a slight leak in the gasoline tank. The tank was built of sheet copper, 1-16 of an inch thick, and without reinforcement to protect the bottom. Slung at the rear of the chassis by two wide straps, almost square in shape, the rear was about 22 inches from the center of the axle. The discharge pipe from the muffler was carried right under the tank and held by a loop riveted to one of the straps, and the end of the pipe projecting about two inches further to the rear. The damage to the tank was directly above the exhaust pipe and the end of the pipe was bent in such a manner as to indicate dropping on an obstruction. The soft copper, offering less resistance than the pipe, suffered most, being bent and torn enough to allow a slight leakage of gasoline, amounting to about thirty drops a minute. The driver remembered dropping into a deep hole that, after dark, was impossible to avoid, and it is extremely probable that the damage was done there. The dangers that an unprotected gasoline tank is subject to in striking stones, collisions in traffic or striking something while reversing is sufficient to cause many manufacturers to place it under the front seat. On this car both exhaust pipe and bottom of the gasoline tank were battered quite a little, showing contact with the ground many times.

All gasoline cars must have a control system and the designer usually has a free hand to work out his own ideas. Simplicity, long life, ease in manufacturing are usually the principal points kept in view. The preeminent consideration should be “safety” and in perfecting the design the ultimate must always be considered. One type of car, equipped with

a sliding gear transmission, did not have a neutral position provided for the control lever. To attain the same result the clutch pedal was provided with a latch, locking it in release position. While working on the car in the garage one day, with the motor running, one of the repair men struck the pedal accidentally, and, one of the speeds being in mesh, the car ran away, though it was caught before any damage was done. Here there must be quite an element of danger in persons getting in or out of the car accidentally striking the pedal, to say nothing of mischievous youngsters who would not hesitate to start a car running away, thus possibly causing a serious accident.

The question may be asked if there are advantages in this system that would make it more desirable or overcome the need of considering the factor of safety. The planetary gear system is more prone to troubles of this nature, yet it has advantages in the fact that were a sliding gear system handled in the same manner as the planetary gear, the gearbox would be ripped to pieces in short order.

Steering Gear Defects Are Very Dangerous.

Newspaper reports of serious accidents invariably give the cause as due to the steering gear, though whether the report comes from an expert or the reporter that views the wreck is not told. That steering gear trouble is the most alarming form of trouble that can take place is evident, for if anything else gives way the probability is that the car will be stopped in a very short distance, or at least subject to the control of the operator. If any part of the steering system breaks down all control over the car is lost, and the wheels may be deflected by slight irregularities in the road. The driver, possibly aware that something is wrong, will naturally center his efforts on the useless wheel in front of him. If the steering system is not designed properly and with a thorough comprehension of the conditions under which it must operate, it must be tested daily, and then it is not safe to trust it too much. This does not refer to the proportioning of the material or the composition of the steels used, but to the work in the drafting room. A chain is no stronger than its weakest link and the steering system follows the same rule, its weakest point is usually lying between the junction of the steering arm with the drag link and the worm and sector. A mistake frequently made is that of putting in a steering gear that is too light for a heavy car, and when subject to heavy shocks is liable to bend the arm or shaft; then the degree of right and left throw is changed, possibly so much that the car will not turn a corner without reversing. When the weight and speed of a high-powered car are considered, the hard driving over rough roads, the steering system is subjected to very severe shocks, and the remarkably few accidents that are caused by the troubles which can actually be traced directly to the steering system is a

most convincing tribute to both the designer and the metallurgist.

Where the Steering Gear Is Apt to Go Wrong.

One high-powered heavy car has a front axle that has stood the shock of striking a telegraph post while traveling at a speed of a mile a minute. The axle between spring seat and steering pivot took the shock and the end was bent about three inches through without sign of fracture. The cross steering rod, connecting the two wheels, was fastened to the steering pivots by ball and socket joints. The knuckles are curved so that the balls hang directly downward and, entering directly into the socket, are held by an internal cup nut with castelled head and split pin. This works very well when new, but use—it being impossible to keep the joints free from dust—will soon change the shape of the ball from circular to elliptical at its equator, thus necessitating continual adjustment. The wear, not being evenly distributed, and the continual adjustment necessary to keep the sockets tight enough to prevent the ball passing through, caused binding when the wheels were cut to extreme left or right. When traveling over muddy roads the mud seemed to choke the sockets and allow the wheels to turn about only 20 degrees either way from straight ahead, and thus making the use of reverse necessary to get around a short curve. These faults are of secondary importance when it must be said that the cross rod has dropped while on the road. One car suffered this while traveling on a mountain road, but the driver stopped the car before any damage was done. On another occasion the rod dropped and caught between the spokes of one of the wheels. The car was running very slow at the time and the wheel did not suffer beyond a little paint. On account of wearing considerations, the amount of adjustment allowed for must be limited and this is soon all taken up. A partial remedy is to be had in enclosing the joints in covers and packing them with grease. Considered from the manufacturer's standpoint, yoke-shaped connections would be cheaper to forge, machine, and would be absolutely free from the many troubles the ball and socket type is heir to. Very few people would care to purchase a car subject to steering gear troubles.

There is no perfect car, though some cars have reached a high standard of development. Their designers, studying the action of each individual piece of mechanism, and giving it all conceivable tests to eliminate faulty or poor designs, and thus working continually on the same type of car, have it developed as near to perfection as the engineering standards of to-day have reached. The use of chrome-nickel or vanadium steels in axle or crankshaft may indicate a desire to put the best material that money can buy into the car, but they will not help a defective fuel or steering system in the slightest. Improvement in design, to be effective, must be applied to what experience shows to be defective.

ONE OF THE NEW USES FOR OLD AUTOMOBILES

MANY photographers in the East-end of London publicly advertise that clients can be photographed in a motor car if desired, says *The Car*. In conversation with an assistant in one of these studios, he explained the details to the writer. No extra charge is made for the temporary use of the car to-day, though, when the idea was first adopted, this was done; but the competition between the photographers on Sundays, when most of the business is done, is so keen that the charge has been done away with. The cars are hired for the occasion, and all the extras, even down to the goggles and ladies' veils, are supplied. The young man is instructed how to take his seat, and the young lady is asked to compose her features, but the advice is generally useless, as, in the words of my informant, "ninety-nine out of a hundred of them look as if they would be more at home on top

of a bus." On Sundays, parties follow each other, and those who are waiting their turn stand in the yard and watch their predecessors being "took." On weekdays those who wish for the use of the car must notify the photographer beforehand. It would be a dead loss for him to get the car for one party, so he takes the names of those who desire this style, and when he has got a half dozen parties who are willing and able to attend on the same day he arranges for everything. The cars used in this way are ones that have had their day and have been superseded by more up-to-date vehicles. The aliens, who are so numerous in the East-end, are particularly fond of being taken in this manner, in order to send the cards home to impress their relatives with the success they have achieved in England, as the subjects manifest a fitting sense of the importance of their position.

DETAILS OF THE FOUR NATIONAL MODELS

WITH a view to meeting as widely varying demands as possible, the National cars are being shown this year in four distinct models of touring cars, in addition to which there are the National roadsters and limousines, so that there are practically eleven models in all. These are divided into two groups, the four- and the six-cylinder types, though there is a striking amount of similarity, not alone between these, but all of the cars, so that any of them will be recognized at once as the product of the same factory. Of the four models, the little six is new, as is also the big four, Models N and T, respectively. The policy of the National designers of adhering to separately cast cylinders has been departed from to the extent of employing cylinders cast in pairs on the small six-cylinder model, though both the large six- and the large four-cylinder machines still have separately cast units. The motors are all turned out in the home factory, and are characterized throughout by those features that have become distinguishing marks with the builders of the National.

Chief among these is the employment of the D. W. F. ball-bearings for supporting both the crankshaft and the camshafts, there being seven of these annular ball-bearings on the crankshaft of the large six-cylinder car, and four on that of the little six, owing to its twin cylinders. Double ignition, employing two sets of plugs, one placed over the inlet valves and the other over the exhaust, characterizes all four models. With the exception of Model K, which is one of the representatives of the National line that is substantially the same as its 1907 predecessor, a Bosch high-tension magneto is employed as the source of ignition current. On the Model K, a Remy high-tension magneto forms the equipment, the supplementary ignition in each case consisting of a storage battery with a single coil and high-tension distributor.

One of the distinctive features of the big six National is the employment of brass closing plates for the openings left in the sides of the jackets of the single-cylinder castings, which are of the outboard valve-port type. The use of this form of construction permits the cylinders to be placed very close together, and makes a very much shorter motor than is possible with the regulation type of closed jacket, in addition to which the large openings permit of the effective removal of all the core sand. The little six is the only National on which twin cylinders have been employed, but the manner in which the design is carried out would make it appear that the National designers are fully as conversant with this type as that to which they have

devoted all their attention for several years past. All the castings are made with flat tops, and the water piping is greatly simplified, besides being made less conspicuous by carrying it along the sides of the cylinders. The same yokes are employed on each side to retain the inlet and exhaust manifolds and the respective circulation piping on the same side. Gaskets have been eliminated on all these joints, ground taper joints having been substituted, thus facilitating repairs and reassembly.

The valves are all made of nickel steel heads on machine steel stems, the diameter being 2 inches in the big six, and 1 7-8 inches in the little six, all being made interchangeable in the various models. Hardened and ground lifters, working in bronze housings, equipped with felt boxes to prevent oil and dirt working into the crankcase, are employed. The pistons are made with heads slightly domed, and carry four angularly split compression rings, all of which are placed above the wrist-pin. The connecting rods are made with marine type big-end bearings, and are split at their upper ends. Steel and bronze spiral pinions are employed for the timing gears. A Crandall mechanical oiler takes care of the essential of lubrication, the oil being distributed directly to the cylinders, the crankcase, and to the change-speed gear and rear axle unit, the oil for these different parts all passing through sight feeds on the dash. The practice of distributing oil directly to the transmission system of the car eliminates quite a number of grease cups. The water-circulating pump is situated forward, on the left hand of the motor, and is driven by a separate shaft, the Bosch magneto being similarly situated and driven on the right-hand side.

In Model T, the big six-cylinder car, the motor has 5 by 5-inch cylinders, while its wheelbase is 127 inches and its rolling equipment consists of 36 by 5-inch tires. In Model R, or the little six, the cylinders measure 4 1-2 by 4 3-4 inches bore and stroke, the wheelbase is 116 inches, and the tires are 34 by 4 1-2 inches. The large four-cylinder car, Model N, also has 5 by 5-inch cylinders, its other dimensions being the same as those of Model K, which has a 4 7-8 by 5-inch motor, 122-inch wheelbase, and is shod with 34 by 4 1-2-inch tires. The Schebler carbureter is employed as a standard part of the equipment for this essential on all of the National motors.

No attempts at the introduction of untried innovations are to be found on any part of the chassis of the various models, and this is particularly true of the transmission systems, which are substantially the same as those which have always distinguished the National cars. The

Chassis of the National Model R "Little Six."

Magneto Side of the National "Little Six" Motor.

time-tried leather-faced cone clutch is to be found on all of them, eight flat springs being interposed between the leather and cone, to ease the engagement and assist in releasing the clutch. These springs rest in recesses of the leather band. Uniformity of design is also to be found on all four models where the change-speed gear is concerned, a selective type giving three forward speeds being employed in each instance. This gear box is of a distinctive type of design that has long been identified with National practice, in that the main and counter shafts are both carried in the same vertical plane, the main shaft being superimposed. It is supported on three liberal-sized Hess-Bright annular ball-bearings, while the countershaft requires but two. Connecting the gear-set with the rear axle driving unit is an enclosed propeller shaft, the tubular housing having a yoke end forward hinged to one of the transverse members of the frame, while at its rear end it is brazed directly into the spherical steel differential housing. Between this supporting tube and the driving shaft, two annular ball-bearings are interposed, one at each end.

In the braking equipment the usual practice of concentrating the brakes in drums placed on the driving wheels has been followed. Both the running, or service, and the emergency brakes, are of the expanding type, the former engaging against the inner face of a drum 11 inches in diameter, while the latter engages

Showing the Simple Water Piping Arrangement.

a 15-inch drum. Instead of the usual friction materials employed for this purpose, a metal-to-metal contact is employed. Ball-bearings have been specified wherever good practice has indicated that they could be used to advantage, so that in addition to those used on the crankshaft and camshaft, the gear-box, propeller shaft, differential and the like, they have also been introduced into the support of the steering knuckles.

Use is made in all the models of the platform type of spring suspension in the rear, the side members employed in connection with these transverse springs being exceptionally long, ranging from 56 inches in the big six car to 50 inches in the little six, as well as both the four-cylinder models. The big six carries a 39-inch transverse member for the platform suspension, while in others this spring measures 37 inches. The forward suspension consists of the conventional semi-elliptic springs, measuring 40 and 44 inches in length on the models already classified. The form of subframe construction for the support of the power plant and change-speed gear, as hitherto used on the National cars, has been adhered to without any change. On all, except the Model K, an option is given on either the new type of straight line bonnet adopted this year, or the familiar round bonnet and radiator that have always been

Some Essential Components of the National Motors, Including the Ball Bearing Crankshaft.

National features, and that are familiar on road and track.

It will be evident from a review of the foregoing specifications of the National line for the present season that time-tried and approved engineering standards have been closely adhered to throughout. The cars represent the result of an evolution extending over several years, rather than a complete construction designed to meet the present demand and to be abandoned in favor of something different a year or so later. The original structure stands out prominently beneath the numerous detailed improvements that have been added from year to year, the process being one of constant refinement rather than change. This is equally true where the new models are concerned, as it is with their predecessors, as the same features of construction that characterize the latter have been applied in designing the new cars, which reveal the same painstaking care in the execution of those numerous details of construction that go to make a car reliable in everyday service, or the reverse, according to the manner in which they are taken care of by the builder. It is the little things that count on an automobile, and that they have been amply provided on the National models is apparent.

LETTERS INTERESTING AND INSTRUCTIVE

WIRING CELLS FOR A SINGLE-CYLINDER MOTOR.

Editor THE AUTOMOBILE:

[1,319.]—I am sending you herewith a rough sketch of a wiring diagram for a battery on an auto, and would like to hear from you whether it is correct or not. Please publish a correct diagram, showing how to wire eight cells for a single-cylinder motor, as I think it would be of much interest to some of your new readers, of which I am one.

A. D. CARPENTER.

Sauk Center, Minn.

The sketch you send is correct for wiring eight cells in series-multiple connection, that is, two groups of four each in series (zinc to carbon), while the groups themselves are connected up in multiple (carbon to carbon and zinc to zinc), thus giving the voltage of four dry cells and the amperage of two. The accompanying diagram shows how to wire eight cells for use with a single-cylinder motor. Connect the two groups of four in series as already explained, using a common ground connection for both, as shown at the left-hand end of the sketch. The horizontal lines in the form of an inverted pyramid constitute the accepted symbol for a ground connection. Provide a three-point switch and connect the terminal of one group of the batteries to point No.

Diagram for Wiring Eight Cells for a Single-cylinder Motor.

1, as indicated; then connect the second set to point No. 2, as shown. By moving the switch lever from 1 to 2 the different sets of cells may be used alternately. Connect the carbon terminals of both sets of cells to point No. 3 on the switch. This will give a series-multiple connection enabling both sets of cells to be used together and will be found handy when they are no longer fresh. Connect the other end of the switch lever, indicated by the single point at the right, to the primary, or low-tension, side of the induction coil. Both the primary and secondary windings of the coil must be grounded, as shown, this usually being made in the form of a single connection by coil makers. A high-tension cable is led from the secondary of the coil to the plug. The ground connection indicated on the latter is taken care of by its insertion in the cylinder.

WOULD LIKE TO HEAR FROM MAXWELL OWNERS.

Editor THE AUTOMOBILE:

[1,320.]—I would like an answer to the following: I have a Maxwell two-cylinder touring car which I ran 5,600 miles last year and one thing about its running has annoyed me and it remains an unsolved problem. The engine on starting will miss a few strokes, then black smoke issues from the muffler, and finally on giving it more spark and throttle, everything is all right and there is ample power for hills and sand and speed up to 30 miles an hour. How to make this engine pick up without the bad mixture having to be worked off is my problem. If it be liquid gasoline sucked up into the cylinders shutting down the needle valve, opening the air ought to cure it, but I am compelled to set the air and needle valve where it will give the power required on the road. If I might hear from some Maxwell expert or owner, I will be happy. Should any owner care to correspond with me, I will exchange experience.

Oak Park.

CHARLES J. RADWAY.

Maxwell owners who have had similar experiences, and who think they can help Mr. Radway out of his difficulties, may write to this department and their letters will be published here, or, if Mr. Radway will send his complete address, it will be given to those wishing to correspond with him direct.

GREASE-SAWDUST "DOPE" FOR SILENCING GEARS.

Editor THE AUTOMOBILE:

[1,321.]—Somewhere I have read of a combination of grease and sawdust for use in front timing gears to prevent the roaring of the same, especially when the motor is running fast. If you can enlighten me as to the proportions of each, I will much appreciate it, as this is an annoyance which it appears difficult to correct on my car.

HARRY S. HALL.

A mixture of grease and sawdust has been adopted in street railway practice to silence the reduction gears between the motors and driving pinions, and works very effectively. In isolated instances the same expedient has been resorted to for the purpose of silencing the change-speed gears on old cars. What is known as jeweler's sawdust would be the best material for the purpose, owing to its fineness and uniform consistency. The proportions will naturally depend upon the character of the grease employed, but sufficient should be used to make a mixture of a comparatively stiff consistency that will not work out of the case. This combination cannot be employed in a location where it is apt to find its way into ball bearings, as the material will get into the races and the balls will act as a mill, quickly becoming very hot.

IGNITION AND VALVE TIMING ARE WRONG.

Editor THE AUTOMOBILE:

[1,322.]—Will you kindly give us some suggestions regarding our Reo engine? We have a 1905-1906 Reo car, and have changed the two carbureters for a single Breeze carbureter, but we cannot get both of the cylinders to run when the motor is slowed down. We have carefully examined the valves and have timed the engine exactly, according to the best of our knowledge, so that both cylinders take gas at the same time and spark at the same time. The compression in both cylinders is the same.

Choptank, Md.

W. M. WRIGHT & COMPANY.

If you have so timed the motor that "both cylinders take gas and spark at the same time," it is marvelous that you have succeeded in ever getting them to run properly. In the two-cylinder, horizontal type of engine, such as the Reo car is equipped with, it is customary to place the crank throws 180 degrees apart. Thus, the pistons both approach the center and recede from it together. Hence, when one cylinder is firing, the other one is drawing in a fresh charge, and when the cylinder which has just fired, is exhausting, the other one should be compressing. Then the cycle of operations is repeated. If you will adjust the valve and inlet timing of your motor so that it may work as outlined above, you should have no further trouble with it.

EXPLAINING THE DIFFERENT METER READINGS.

Editor THE AUTOMOBILE:

[1,323.]—I noted "Four Cylinder Sal's" queries in regard to coil testing experiments. He brings up a number of interesting points. From reading his letter I think that I am correct in assuming that the readings which were higher for the French instrument were made in series with a vibrator coil, also that in both cases where the instruments were compared with a standard this was done with a constant, continuous current. The fact is that two instruments which agree perfectly with each other when compared by means of a continuous current may, especially if of different construction, show widely varying results when connected to an interrupted circuit, such as that which embraces a vibrator coil. The explanation of this fact is briefly as follows:

The current is at zero amperes when the circuit is first established at the vibrator, rises till the maximum amount is reached, which is at the instant of the breaking of the same by the vibrator, when it falls rapidly to zero. This process is repeated while the coil is in circuit at about seventy or more times per minute. The result is that, owing to the inertia of the indicator needle and other causes, the needle has not time to either reach the maximum value of the current or to return to zero. It therefore takes up a position about midway between these two points. For various reasons some instruments respond much more readily to the rise

of current than to the drop. These will therefore give a higher reading than instruments which are not so responsive.

The explanation of the apparent discrepancy of the two standards may, of course, be explained by assuming that the amperemeters may have undergone a change during the time elapsing between the two comparisons or that one or both of the assumed standards were not such. On the other hand, it may have been the fact that in the second case the comparison was made by substitution, and that the pocket instruments had a slightly greater resistance than the standard instruments, thus altering the resistance of the circuit and the amperage. Theoretically the resistance of an amperemeter should be zero, and in standard instruments it closely approaches this value. While in small-sized pocket instruments it is probably much greater than in standards, yet under the conditions of actual use this resistance is so small when compared to the total resistance of the circuit as not to materially affect results.

HAROLD H. BROWN.

HELPING HAND FOR FORD RUNABOUT OWNERS.

Editor THE AUTOMOBILE:

[1,324.]—In letter No. 1,217, March 12 issue; also letter No. 1,277, of March 26 issue, in regard to trouble with Ford runabout, would say that I think I can help them out of their trouble. The trouble I think is with the pipe that runs from the gasoline tank to the carbureter. The brass pipe that runs from gasoline tank to carbureter runs close to and parallel with exhaust pipe. When going

Suggested Changes in Gasoline Pipe Supply Arrangement.

up a hill, or, perhaps, after running 8 or 10 miles without stopping, the exhaust pipe gets almost red hot, and that in turn makes the brass gasoline pipe hot and this makes gas of the gasoline before it gets to the carbureter, and that makes a weak mixture and loss of power. To remedy this, disconnect brass tube at gasoline tank, take out plug at the bottom of the tank, get one-half inch street ell, put in bottom of tank in place of plug that was taken out, then get a one-half inch piece of pipe about 4 inches long, threaded at each end, put one end in street ell, then get one-half inch elbow, put on other end of pipe. Put the plug that was taken out of tank in the elbow, connect gasoline pipe and then you have it. Care should be taken not to have one-half inch pipe too long, so as to be sure that the brass pipe does not rub against driving shaft, as it might wear a hole in it. Below is a rough sketch of what I mean. This is a very easy job, and anyone can fit it in half an hour, as the bottom of tank is threaded to take one-half inch street ell where plug is taken out.

Battle Creek, Mich. CHARLES GILBERT.

MR. FRANKLIN BOTH AGREES AND DISAGREES.

Editor THE AUTOMOBILE:

[1,325.]—Your reply to Mr. Fay's question: "Why is it that there are not more high grade cars driven by air-cooled engines?" is certainly very fair; we think practically correct, so far as it goes.

However, we are inclined to take exception to your statement that "It appears to be more difficult to sell air-cooled cars." Is it more difficult? In most cities where the Franklin is sold its sales are larger than the sales of any other one make of automobiles, and in some places the sales of the Franklin outnumber the combined sales of all other makes of automobiles. For example, in the State of Washington we have twice as many cars as our

nearest competitor, which is a low-priced water-cooled runabout. In 1907, 119 Franklins were sold in the city of San Francisco. Of the American manufacturers there are only two or three who sell more automobiles than this company, and these are the makers of the very low-priced machines. In value of sales the Franklin is probably about next to the top.

We think the point is, that a water-cooled automobile is easier to make than an air-cooled automobile; that is, there is less knowledge among manufacturers of the science of air-cooling. Most anyone can make the water-cooled motor, as only ordinary knowledge is required, it being easier to cool. In the air-cooled motor, it is a case of knowing what to do and doing it scientifically.

Otherwise, we agree with all you say.

H. H. FRANKLIN MFG. CO.,

Syracuse, N. Y.

H. H. FRANKLIN, President.

CITES AN ADDITION TO MR. GODLEY'S LIST.

Editor THE AUTOMOBILE:

[1,326.]—As a reader of your journal, I was interested in the article of the 9th, comparing American and foreign light cars. Your statement that the only American cars of that class were the Thomas 16-20 and the Franklin 16-20, omits the \$1,100 Cameron 16-20, 4-cylinder, air-cooled touring car—a reliable little vehicle. It seems to me that there is a great field in this country open to this class of car, on account of their initial low expense and their low rate of operating and tire charges. On the other hand, they can give to the ordinary man, who has not more than \$1,500 to put into a car, all the service and roadability he usually needs. For such a car it would seem that the ideal engine is a three-cylinder, air-cooled, two-cycle engine, with friction transmission and double side chain drive (chains enclosed), reinforced wooden frame, magneto ignition, the power to be from 15 to 20 or 22 horse. I venture to prophesy that five years hence will see many cars built along the above outline in actual use in this country.

Brooklyn, N. Y.

"TWO CYCLE."

ATTRIBUTES DIFFERENCE TO ERROR ON SCALE.

Editor THE AUTOMOBILE:

[1,327.]—In reply to letter No. 1,292, in the April 9 issue, I would suggest that the readings taken on the coils and the readings compared with the standards were on different parts of the scales. Now many of the low and medium-priced meters used in laboratory work are correct in one part of the scale (usually near the center) and have a considerable error near the ends of the scale. This might explain why the errors were so different with different current readings.

H. A. FISKE.

Kingston, R. I.

TWO-CYCLE, TWO-CYLINDER FRICTION DRIVE.

Editor THE AUTOMOBILE:

[1,328.]—In answer to letter No. 1,297, in the issue of "The Automobile" of April 9, there is a two-cycle, two-cylinder, friction-driven runabout made here in Buffalo and called the Chief. The concern that manufactures it has an office in the Ellcott Square, Buffalo. I am under the impression that it was first shown here at the automobile show this year. It has either 28 or 30-inch wheels, and is somewhat similar in appearance to the Model N Ford.

GEORGE N. LIPPITT.

Buffalo, N. Y.

OUTSIDE INFLUENCE CAUSE OF DIFFERENCE?

Editor THE AUTOMOBILE:

[1,329.]—Referring to your query No. 1,282, under "Letters Interesting and Instructive," it has occurred to the writer that possibly the meters referred to are of the permanent magnet type, in which case, in using or making tests it is quite important that they do not come in close proximity to other similar meters, magnets, or iron of any nature. This will affect the reading, and it is possible in making the tests referred to that this point was not considered.

E. C. WILCOX.

Meriden, Conn.

DURYEA BUGGYAUT MEETS THE REQUIREMENTS.

Editor THE AUTOMOBILE:

[1,330.]—Mr. Strawn's inquiry for an auto using friction drive and two-cylinder motor is met by the Duryea buggyaut. It is also air-cooled, using two cylinders 4 3/4 by 4 3/4 inches. The peculiarity of this vehicle is the arrangement of the drive. It consists of grooved rollers bearing in large grooved rings and drives much as does the locomotive wheel on the rail. These rollers are of two or more sizes, and can be shifted by steps so as to give different speeds, but not a variable speed.

CHAS. E. DURYEA.

Reading, Pa.

At last the problem of how to be both *chic* and warm when autoing has been solved. The day of the fur coat is almost past, so far as this season is concerned, and already there is a lively sale of cloth and pongee wraps with linings that make them comfortable for early spring wear, and yet these same coats are not too heavy for certain summer use. A prominent importer is showing some unusual styles in homespuns and Scotch tweeds whose lines are plays on the voluminous evening wraps we have seen during the past winter. The accompanying illustration of the papillon coat represents one of the picturesque models fashioned after the popular butterfly wrap that every woman who owned one found it the most comfortable outer garment she ever possessed.

The cut of this coat is quite out of the ordinary and extremely smart, yoke and sleeves merging into one, yet with noticeable absence of the much abused Japanese sleeve. The collar is wide and provided with an extra piece of cloth cut triangular shape which may be closed snugly under the chin, bringing the collar over the ears. Fancy metal buttons close the fronts of the wrap, which spread to generous proportions as they near the hem, while a bias seam at the back saves it from uncomfortable bulkiness. The material employed in this remarkable garment is tweed nearly half an inch thick, but as light in weight as eiderdown. Golden brown with indistinct markings of Irish green make this particular papillon coat one of the most attractive that has been placed upon the market this season.

One of the most interesting features of the spring fashion exhibits are the oddities in automobile coats. At a recent opening there was a prevalence of light colors made even more conspicuous by touches of brilliant hues such as flame color, scarlet, jockey green and kindred shades. On an imported pongee coat the accessory color was canard blue—that intense tone found on the tips of the wings of fancy ducklings. Another extraordinary combination was olive green pongee and Japanese coral. Beside the pipings and lining, which were of this color, the sleeves and fronts were decorated with large imitation coral buttons, which, together with long silk loops, closed the gar-

ment. With these gay color schemes running rife in extreme fashions, much variety and modishness may be achieved by judicious use.

Many models both artistic and serviceable are shown in various weights of pongee and rubberized silk. The choice in both materials ranges from the severe dust coat to the full flowing model with cape-like sleeves and ample fullness from shoulders to bottom. The natural tan or mode tones of pongee are in high favor, and make excellent foundations for the garish Oriental embroideries so much the vogue just now. With the prevailing craze for Danish blue, the Chinese blues which border strongly

on this shade are being pressed into service to great extent. And very pretty are these wonderfully wrought embroideries done in soft blues with now and then touches of yellow or green. These elaborately trimmed coats have an additional merit inasmuch as they accommodate themselves to almost any style gown and are in good taste for all occasions.

Quantities of handsome braiding are found on many of the elegant wraps for autoing. Showy ornaments and brandenbourgs in the color of the coat they decorate are also much used in connection with needlework. Another modish trimming is made of heavy cordings covered with pongee and formed into all sorts of fantastic ornaments and applied in conspicuous parts of the garment. Midway between the two extremes of severely tailored coats and those of fancy silk is the province of picturesque models less practical than the former and more expedient than the latter. Unless the elaborate automobile coat be treated with skill both in the cutting and ornamenting it becomes an unsightly thing to be shunned by women of discriminating taste. Thus it is advisable to consult only the best dealers when ordering automobile toggery that will meet the demands of fashion and retain, indefinitely, its smart effect.

The high Directoire collar is a feature of some of the recent importations, and whether of the turned down order or merely straight and high, is exceedingly becoming to the woman of long, slender throat. A long touring coat of biscuit-colored pongee, semi-fitting and falling gracefully from the shoulder, ripples slightly toward the hem and has bias folds of tobacco brown silk finishing the brown and cross-banded collar, cuffs and pockets. The effect is extremely modish, yet quite simple in treatment. On a similar coat of gray pongee the decoration consists of green leather tabs running down the front and fastening on opposite sides, also extending over the shoulders in Gibson effect. The high, straight collar is of the same material and closes tightly about the throat. Another stunning model, in elephant gray, is trimmed with tiny insets of shrimp-pink leather introduced in the collar and cuffs and in the centers of the braid, ornaments fastening the fronts.

Some exceedingly good auto coats in rubberized silk in gray, brown, tan, blue and green are being worn. Like all garments for this use, they are long and loose, and many of the smartest models, instead of having double-breasted fronts, fasten to the left side, thus allowing double thickness over the chest and no possibility of cold penetrating through the opening. This side fastening in one form or another is gaining favor with coat designers both here and in Europe. Many of the recently unboxed models show this mode of closing. The reseda green silk rubber coat pictured is an example of the possibilities of this side fastening, yet it has the appearance of closing directly in the front, and in all its details is a particularly charming model. Special attention is called to the white satin wind cuff, which feature adds admirably to the comfort of the wearer.

A certain well-known dealer in high-class automobile apparel is showing a capital wrap for easy access. This fetching cloak is of the Inverness cape type, comfortably long and warm. Like the first tweed coat described, this great cape is also fashioned of that delightfully light weight material that possesses nearly the same amount of warmth as fur. The rich crimson mixture

Biscuit Colored Pongee Coat with Plaid Trimmings.

is brightened by stitched tab effects of plain red broadcloth. So cleverly cut is this cape that its skirt provides ample fullness to doubly cover the lower part of the body with the overlapping fronts. Past experiments with double cape effects have invariably proven futile, despite all the improvised strapings to prevent the wind from pelting the face of the wearer with the corners.

When the auto coat is but lightly lined, or perhaps there is no lining at all, an extra waistcoat or sweater makes it more practicable for cool spring days, and all through the summer months such an adjunct would be a serviceable possession for long trips in the automobile. Brown and white and black and white checks in English worsted makes a stylish waistcoat that may be worn with almost any color wrap. Or, if these combinations are not fancied, here again is a splendid opportunity for an enlivening touch of color. In the matter of such details, one is at liberty to choose whatever is considered the most becoming, provided, of course, that the contrast with other articles of apparel is not inharmonious. Some women motorists prefer conspicuous waistcoats that show wide contrast when the outer wrap is opened, and if the coat be of somber hue this little vagarie is rather pleasing.

Certain English sweater models of fine wool, buttoning double breasted from shoulders to hem, are finished with straight standing collars of supple leather. The same material is found on the cuffs and the covering of the buttons, all of which trim the sweater effectively. Other styles in English sweaters have leather belts and pocket flaps, giving them a more elaborate appearance. A loose coat of heavy, rough material has, instead of a sweater to supplement its warmth, a stock and shield of knitted angora, and with it is shown a muff of the same soft wool, nearly three-quarters of a yard long and of proportionate width, with but little perceptible weight. These comfortable accessories are made

by the French nuns in their places of exile. The sets are white or smoke-gray, lined with self or contrasting color wool, also crocheted or knitted.

Nothing new in automobile veils has appeared, but all the old favorite designs are made up into voluminous hood-like affairs that cover the hat and tie at the side or back, the latter being the latest fad with the smart autoist. If there is any choice in the matter of designs, it falls to polka-dot effects. There is no fixed law as regards color, so long as the pattern offers plenty of contrast. The goggle that is pronounced most satisfactory by many enthusiastic women automobilists has but one lens or window. This gives the wearer unobstructed vision in every direction, while the double windows are claimed to tire the eyes. This new goggle is mounted on a dustproof wire screen which affords ample ventilation and which is made further comfortable by a chenille covering over the wire rim.

SOME SPRING NOVELTIES SHOWN IN LONDON.

A new English coat designed for women automobilists' spring wear, and shown at Drykitt's in London, is built of grayish green Lovatt tweed, full length and double breasted, and is fitted with two separate detachable linings. The one is of squirrel lock, with which there is a soft nutria collar to fall over the tweed, and the other is of the finest Cape lamb leather, of extremely light weight. Both these linings are fastened in with patent studs. As the tweed is in all respects perfectly finished, it is possible to wear it without either of its linings, and thus three combinations are to be found in one wrap.

In London novelties, several light overcoats for women have made their appearance. One of these is in a soft shade of green, striped with a darker toning. The garment is nearly full length.

The other coat is in the same fine cloth in brown shading, and is made double-breasted.

AUTO TALES TOLD OF THE UNSOPHISTICATED

By CHARLES B. HAYWARD.

ONCE upon a time there was a man who set forth to become the possessor of an automobile, and, like unto most others of his ilk, he wished to see many, many cars before taking the fatal step—remember, this was in 1904—and, in the seeing, to accumulate one of those vast funds of knowledge with its attendant vocabulary that makes of a man an autoist. He had already looked over quite a number of what the salesmen had in every instance assured him, with much fervor, were the very best cars in the market—each one, in fact, was *the* representative American car. As to the others, the less said the better, though, be it said in passing, there was hardly a salesman in the lot who had not sufficient love for his competitors to put in a good word or two for the other fellow, merely to give a faint idea of how very, very rotten the other fellow's car actually was. Of course, he could say a great deal more and often did, but it is hardly necessary to dwell further on this phase of the matter.

As already mentioned, the seeker after information, and a car, had seen quite a few when he was introduced to one that was the virgin four-cylinder vertical product of a factory that had, up to that time, devoted itself exclusively to the production of smaller cars and had made quite an enviable reputation thereby. Consequently the name of the car was not strange, though this was something that could not be said of its appearance. Other cars had salient points, but it required their backers to bring them to the notice of the intending purchaser; on this one they stood out all over, no one could possibly miss them. After taxing the powers of the salesman not a little for one of his caliber, for some salesmen were not any better equipped with technical knowledge than they are now, one of the members of the agency firm who *did* know the car joined in the conversation, or rather relieved the salesman, much to the latter's satisfaction. "What on earth do you put such extraordinarily long hubs on your car for?" resumed the interrogation point. "Oh, those," said his new informant, "best hubs on the market. Clever piece of designing, that. Those hubs are water-cooled. You can drive your car up any hill you can find and your wheel bearings will never get hot. Great thing to have on your car."

But the seeker was not sufficiently convinced and passed on, and in the course of his rounds examined other cars. Carburetion, ignition drives and the hundred and one other preliminaries that the man who is learning the game wants to know all about having been thoroughly gone into, on the next one he came across, the seeker thought it was time for him to ask a few. "Your car hasn't got water-cooled hubs, has it?" he naively inquired. "Water-cooled what?" said the salesman. "Why, water-cooled hubs to keep the bearings from running hot, especially when you're climbing hills."

The Show a Most Prolific Source.

Probably 90 per cent. of all the tales told of unsophisticated buyers have their origin at the annual shows, and, despite the vast spread of technical and *quasi* technical knowledge that the automobile has brought in its train, the crop appears to be unfailing, though, perhaps, not as generous as it has been in former years. Whether it be due to the fact that the salesmen of one year are the general sales managers and presidents of companies of the year following, certain it is that the crop of utterly unsophisticated technical talkers, whose mission it is to interest the prospective buyer, is never lacking. Cars may come and cars may go, but the salesman who has to refer you to the "technical man" or the "factory man" or the "mechanical man" of the firm, the

moment your inquiries get beyond the merest commonplace of automobile construction, is apparently always in the front row and the first to catch the eye of the visitor who means business.

Not that the salesmen are any worse than some of the prospective buyers who feel that they have primed themselves with miscellaneous mechanical information and are not at all backward in making the fact known, for it is quite frequently a case of Greek meeting Greek, and the result is almost invariably a tale that is worth the repeating. One of these that grew at the Chicago show was of this order. The prospective one had carefully looked over every part of the car with an extremely knowing air and finally stooped down to take a view from beneath. "My, but that's a large fly-wheel you have there," he remarked; "I don't like that feature at all. What's the use of carrying such a big wheel around with you all the time?" "Oh, that's all right," the salesman assured him blandly; "we'll give you any size fly-wheel you like."

The Eternal Feminine Is Not Lacking.

Some women pick up technical talk almost as quickly as they do conversation of a nature commonly reputed to be an inherent shortcoming of the sex, and, like their brothers, they are not a bit averse to showing their knowledge on occasion. This is another show story. The salesman had realized his opportunity and had discoursed at great length on the advantages of separate cylinder castings, and his hearer drank it all in in order to be able to summon it to her assistance at some future psychological moment. "What did he mean by a 'five-bearing' shaft?" asked the wise one's companion, as they were about to walk away. "Oh you see, on this car," illustrating by reference with a daintily gloved hand to the polished chassis, "there is a crankshaft between each cylinder." "Oh—"

But the salesman feels himself on much firmer ground when he has one of the fair sex to deal with, as even the most innocent-looking of male visitors may turn out to be a sharp. True, upholstery and paint is no longer the chief topic of the automobiling girl's conversation at the show, although she can't get away from them altogether, but it is a rare bird indeed who can boast much knowledge of mechanical details, and the salesman can usually bank upon that. One of the representatives of this species that is almost *sui generis*, i. e., automobile salesmen, was taking much pleasure in describing the beauties and mechanical advantages of the product of his firm's factory, and had progressed very smoothly over a great deal of what might have been shaky ground had even a fairly well-informed male visitor been the interrogator, when the lady asked him, "Oh, what is that there? You haven't told us about that, and I don't remember ever having seen one of those on a car. Our car hasn't got any such thing as that on it, has it, Gladys?"

"Why, all cars have that on," said the professional smooth talker, "only you're not at all apt to see it when the body is on. That's the *contortionist* rod."

But Races Also Produce Their Quota.

Probably the number of stories that have their origin at the automobile race track or along the scene of a big road race are not only far more numerous, but likewise more amusing than those which the show stands bring forth. Unfortunately, however, few of them appear to get into current circulation and so usually fail to come within hearing distance of the man with the retentive memory, or, what is better, the little note book, except when their perpetrator

happens to hold an official position, as was the case in the following instance. He was the referee of one of the 24-hour races, but it goes without saying that he had not been appointed to the position by reason of his great knowledge of things automobile. All the contesting cars had been carefully weighed in at the beginning of the race, and the same procedure was to be gone through at the finish in order to verify the weights. During an intermission, one of the competitors who was then in the lead stopped at the grandstand and jokingly asked the referee if he could take the carbureter off his car in order to save weight. "You can do what you like," replied the official in question, with all due seriousness, "but I'll disqualify you at the end of the race. The rule is the rule."

A number of years ago when there were so few gasoline cars in existence that excitement was derived almost entirely by racing electric cars at county fairs, a designer who was then prominent in that field, and is now even more so as a producer of gasoline cars, took two of his machines down to one of these festive agricultural celebrations held in the vicinity of Providence, R. I. The machines were naturally objects of the most engrossing curiosity to the tillers of the soil who had never seen anything but a two-wheel cart drawn by a hay motor on the race track, and they crowded as near to the vehicles as their sense of personal safety would permit. The machines were designed to make high speed, and consequently could not run very far without being recharged. An impromptu charging room had been rigged up under one of the horse sheds, the current being taken from the trolley circuit on the road outside. The process of charging was the thing that mystified the graybeards most.

"How much does that 'ere machine weigh, neighbor?" curiously inquired one of them of the assistant in charge of this very essential part of the business of racing an electric automobile. "Oh, about a ton, ton and a half, I guess," was the reply. "Crickets, much as that, eh? And how much does she weigh when you get her full?" "Full of what?" "Why, full of 'lectricity, of course. Ain't that what you be shootin' into her now?" Lack of space prohibits attempting to detail the various and sundry arguments by means of which that assistant tried to instill into the agriculturist some of the most elementary principles of electricity with a view to convincing him that it was not sufficiently tangible to have weight, but all in vain. "She must weigh more when she's full. Stands to reason, must be so," and his hearers, with one or two exceptions, were of the same opinion.

Factory Men Have Volumes Tucked Away.

Get an experienced factory man in a mellow and communicative mood and he will open the recesses of his memory. It is more than likely that therein is stored a vast accumulation of tales both amusing and instructive, for no man can go through seven or eight years' experience in building and selling cars, not to speak of repairing them, without having such things actually thrust upon him. Even though he be not blessed with an over-retentive memory, superinducing a reminiscient mood will be productive of a gem or two in the majority of instances, while if half a dozen designers and factory men could ever be prevailed upon to detail their experiences of this kind, there is little doubt that an amusing volume of short stories could be easily compiled.

On one occasion, the owner of a car, which he had bought earlier in the same season telephoned the factory that there was something wrong with the engine and to please send over and have it towed to the shop as it could not be run safely. An examination showed the crankshaft to be so badly bent that the repair was necessarily a lengthy job. The owner took occasion to come to the shop during the course of its carrying out, and was at pains to inform the superintendent that his chauffeur had put the car in that condition

by "running the engine on one cylinder." As a matter of fact, it was the chauffeur's fault, but a jutting rock in the road which could have been avoided was the chief contributing cause.

The Newspaper Man Always a Factor.

But your scribe can always be relied upon to furnish his quota when it comes to "breaks" of this character, and one of them that is quite a gem in its way was the outgrowth of the recent Importers' show in New York. It will be recalled that all the exhibitors on the main floor of the Garden were not builders of cars; there were one or two manufacturers of bodies included and as a means of attaining extra publicity one of them, whose name is a by-word on the other side where fine carriage work is concerned, used space in the daily newspapers to advertise *Carrosserie*, which was the only information vouchsafed, other than that of the firm name appended beneath. This tale brings to light the fact that there are more ways of obtaining advertising contracts than one, though this is a phase of the story that need not be dwelt upon at any great length. The advertisement had been running in this form without change for a week or two when a newspaper man from one of the many so-called "financial journals" requested an interview of the manufacturer. It was granted, and the seeker after business immediately handed up a lengthy type-written brief and requested the manufacturer's opinion of it, remarking, by the way, that it ought to be worth a contract, as if printed it would do him—the manufacturer—a great deal of good in the way of desirable publicity. The latter accordingly set himself to the task of perusing it. "Four-cylinder vertical, water-cooled motor—four-speed selective type transmission—shaft drive, highest standard of workmanship throughout, one of the best "French productions," and a great deal more to the same effect, he noted as he glanced over the numerous long folios of the write-up.

"What might this all be about?" he inquired of his visitor.

"Why, that's a good write-up of your new car that we're going to print, the matter of advertising being satisfactorily settled in the meantime, of course."

"Our new car? What new car are you talking about; we don't build any cars."

"Why, the new *Carrosserie* car, of course."

But the advertising members of the newspaper fraternity are not the only ones to get a bit off the track in this manner. As a matter of fact the scribes of the semi-society sheets are among the worst and most frequent offenders. It is hardly necessary to introduce their breaks; they speak for themselves, as witness the following gem, intended as a technical description of a new model, and taken from a Brooklyn weekly but a short time since:

"The motor possesses all of its valves, inlet and exhaust, on the same side. The cylinders are cast in pairs, and the crankshaft is separated by four bearings. This is a special patented arrangement of lubrication, assuring a continuous flow of oil to all bearings. . . .

"The eccentric rod controlled by the camshaft works, by the aid of a little rod, a pump in the lubricator in itself. It is found on the dashboard of the chassis. The pump driven from the motor sends the oil into the side feeds. The oil is directed from there to the four main bearings of the motor, the gear box and the back axles.

"The fifty-sixty horsepower chassis is fitted with a patented friction clutch, which is made of an ordinary leather cover, male cone encased in a cast rim, forming the female cone. The gear box is four speed forward and one reverse." This is not an extreme instance by any means, as it would be quite possible to cite some that are little short of unbelievable, so utter a lack of even the most rudimentary knowledge do they display.

A Memory of Days That are Gone

SAVANNAH, GA., April 20.—“The Hermitage,” located four miles outside of Savannah, is an old plantation of antebellum days, settled in 1810 by the McAlpine family, of which Judge McAlpine, of Savannah, is to-day at the head. Autoists always visit it when in Savannah. On this plantation were originally owned 222 slaves and their families. The McAlpine family, naturally, did not believe in slavery, for each slave and his family were given a portion of ground, and on this ground he raised various products of the soil, taking them to the manor, or the “Hermitage,” as it is called, for sale. He received fair compensation for his work.

The spreading live oak trees on the plantation were planted in 1815, and form magnificent arches. The plantation is now deserted, and has not been occupied except by descendants of the slaves since the war. The old Hermitage is closed, and two of the basement windows, which are closed by tight boards, are supposed to be entrances to the dungeon, where unruly slaves were supposed to have been confined. This could not have been the case, as the windows enter the wine cellar of the former owner.

The building to the right of the entrance, as the plantation is entered, was the home of the former overseer. The post in front of the door was supposed to have been the whipping post, but this is also not the case, as no slaves were ever whipped at the Hermitage.

The grounds are a mile square, and are very beautiful. They were occupied during the war by a regiment of negro soldiers of Sherman’s army, who looted the place and ruined it. It has never been occupied since that time. It is understood that many overtures have been made to buy the Hermitage, but a price of \$400,000 is placed upon it.

Visitors in Savannah are invariably warned not to go too far from the grounds around the Hermitage, owing to the rattlesnakes. This is probably the most interesting point around Savannah, as the old slave quarters are shown, now gone to rack and ruin, and the descendants of the old slave families meet the visitors with the old coon songs of the days before the war. The former hospital to the left on entering is shown, and in the old days of the plantation a doctor was under contract to call weekly at the plantation and care for the slaves. Common report has it that this was undoubtedly the happiest of homes in the days of slavery, as slaves were taken splendid care of, and the family Bible is said to have recorded carefully, along with the births of the family, the births of the slave colony as well. This was exceptional “before the war.”

Hardly an hour of a pleasant day passes that does not present on the lawn and beneath the grand old live oaks of the Hermitage a vivid contrast between the old and the new, in the presence of automobiling parties. It does not require a surcharge of sentiment for those who have driven there in their modern cars to picture the family coach and four, rolling with ponderous dignity up to the porch; to see in the mind’s eye the pickaninnies swarm about the horses’ heads, or imagine the dignified master and stately matron of the mansion coming down the marble stairway from the porch to greet the arriving guests.

Skirting Florida's East Coast

By
John C. Wetmore

THOUSANDS of automobile owning tourists make an annual Winter pilgrimage to the Florida east coast. Some settle down at one of the half dozen well-known resorts scattered along the Atlantic shore. Of these, practically only the so-journers at Ormond and Daytona, between which lies the world-famous beach speedway, bring their cars with them. At St. Augustine, Rockledge, Palm Beach, and Miami there is a bare scattering of cars outside of those maintained by enterprising auto-liverymen for hire.

Thousands are content each winter to make the journey down and up the coast by train, with never a thought of the touring and excursion pleasures their cars locked up in garages at home would bring them in this maligned, so-called auto-pathless Florida.

Thousands more in the North either store their cars for the winter, or use them in ploughing through snowdrifts, or bucking against face-freezing winds, longing for the coming of spring, or for some warm, not too inaccessible land that will give them touring between leaf-fall and flower-bud seasons.

To all of these, THE AUTOMOBILE correspondent, who has recently made the 372-mile run from Jacksonville to Miami, and in so doing enjoyed the most novel, picturesque, and delightful tour of his experience, recommends the Florida east coast. In the week between the Ormond and Savannah meets, he made the journey, the occasion being a race organized by "Senator" Morgan. It had but few starters, and fewer survivors, but those that stayed out missed a chance for a rattling good rough road battle, so far as competition counts, and a journey through Florida forests and along the Indian river that was a touring dream from the standpoint of novelty and picturesqueness. It goes without saying, and has been repeatedly proven, that an automobile can be pushed over any kind of road through any kind of country. The tourist can even ride with pleasure over rough highways, providing he be content to moderate his pace to suit conditions. Along the Florida east coast it is far from being an all-the-way battle with sand and corduroy paths. For one-third of the journey it is really good going, even when measured by Northern highway standards. For another third it is pleasant riding at a ten- or twelve-mile an hour gait. For the other third one has pretty hard fighting and slow ploughing over rough forest tracks and through heavy sand, not too hard, though, to be a cheap price to pay for the joys of the other two-thirds.

There are good shell, coquina, or gravel, roads in the neighborhood of all the resorts. St. Augustine has 12 miles of shell roads. There are 10 miles of fairly good country road into Ormond, and south, through Daytona and Smyrna, nearly to Oak Hill, 28 miles more of stone and shell highways. Ten miles of good traveling may be had in and out of both Titusville and Rockledge. Sixty-six miles of splendid coquina road stretches from Palm Beach to Miami. In a word, in the run down the coast one has at least 136 miles of good going. Not half bad for Florida, hey?

Four bona fide entrants started in the race from Jacksonville. There were two little 10-horsepower Cadillac runabouts. In one of them Morgan rode as far as Ormond, where its owner, Dr.

W. N. Stinson, took the wheel. The other had Claude Nolan for pilot. Dr. J. H. Pittman drove a 22-horsepower Buick as far as St. Augustine and then quit. The newspaper men went in a chartered 24-horsepower Peerless of the vintage of 1905, with its owner, C. F. Wheeler, at the helm. Harry Wilbur, of the Jacksonville *Times-Union*, and W. H. Harrison, of the New York *Tribune*, were your correspondent's fellow voyagers. Morgan joined the car at Rockledge, Wilbur having shifted to Dr. Stinson's Cadillac as a third passenger.

Much of the story of the trip will, of necessity, cluster around the newspaper car. And right here a tribute is due James Laughlin, 3d, for the splendid work he, Vice-President G. E. Sebring of the Florida East Coast Automobile Association, and their companions in the Cleveland Pathfinder did in laying out the route for the run. The route which was printed in Morgan's Ormond race program was unmistakable and accurate. Save for a 12-mile stretch between Rockledge and Fort Pierce (29:2 to 41:0) the odometer readings were absolutely accurate. The book even marked the dangerous stumps. At crossroads and doubtful places, signs were put up. Following the book and the signs—these for the most part in the little traveled forest and wilderness and not likely to be removed—it will be an easy task to make the run without a guide. A Pope-Hartford party did it thus without difficulty.

We had but crossed the ferry over the St. John river and gone less than five miles before we struck highways that should make the Duval county road authorities ashamed of themselves. Barring the run through a real wilderness between Fort Pierce and Palm Beach, they were the worst we encountered on our whole trip. The 35-mile run to St. Augustine was through a pine forest practically all the way. The road, though well marked, was little

more than a worn path, and at places there were stretches of sand. For all that, one can easily make the journey in three hours. We crossed small and sometimes shaky bridges and at times shallow fords. At places we passed saw mills and turpentine camps. We stopped at Bayard Station at a combination inn and general store for dinner. Its proprietor, whose name I have forgotten and I took no notes, John Anderson tells me is doing a lot of hustling to stir up road building reform in this county. He gave us some valuable hints as to new paths laid out since the pathfinders went through.

Just outside of St. Augustine we struck welcome shell roads carrying us into town. You see, we had been detained by a luckless leaking radiator and so decided to spend the night with Mine Host, John Anderson, of the Alcazar, well-known to all Ormond and Bretton Woods pilgrims.

Our radiator repaired, we made an early morning start for Ormond to catch up with the other racers. We were easily able to make the 50-mile run in 3 hours 35 minutes and to arrive at the Ormond Hotel for breakfast. Then we heard that Nolan had run into a tree and broken an axle five miles outside of Ormond in a race with Morgan to reach the hotel first. That early morning run to Ormond was beautiful. For ten miles out of St. Augustine top speed was possible over a magnificent shell road. Then we struck a stretch of wild country with more saw mills and turpentine camps. En route we ran across two or three of the automobile bridges erected by the senior Mr. White, who gives his name to the White Company. They consisted of two beams, each protected by plank sides to prevent the wheels running off into the ford. The wild country passed and arrived within ten miles of Ormond we struck better roads, fair country highways in fact, leading through the hummock land and beneath great white oaks hung heavy with Florida moss. Next we came to the good road, which ran for five miles along the beautiful Halifax river across meadows and past picturesque orange groves. We had a generous appetite for the breakfast to which our hospitable old friend, J. D. Price, ushered us.

There were good roads ahead of us much of the way to Rockledge, so we did not hurry ourselves to start early for our 74.5-mile run to Rockledge. It was noon when we crossed the Halifax bridge again and sped on our way over the well-known stone highway to Daytona. By the stores on the river front and beneath arboreal arches on the main street we journeyed joyously and then encountered the splendid road to Smyrna, which is 21 miles from Ormond. We swung down once more to the river and sped by great mountains of oyster shells constituting an inexhaustible mine of road material, and across a series of causeways to Port Orange, then over more of the beautiful river roads into Smyrna. The shell road continued to within five miles of Oak Hill.

We had had 28.5 miles of splendid going. We paid for it with rough roads and deep sands for seven miles. Then we entered the prairie at the head of the Indian river and made our way for a mile through tall grass up to the top of our dashboard. Shortly we plunged into the forest, and then followed twenty miles of riding whose beauty and novelty will long remain fresh in our minds. The run was over a hard bottomed and fairly smooth trail through a forest meadow. The tall, stately pines were scattered thinly enough for us to see a mile or more through them in all directions. We were enthralled by the sense of the forest's vastness and awed by the speaking solitude of our surroundings. The air was balmily cool and the green of the meadow pleasing to the eye. All the while the going was so good that we easily made the 20-mile run in an hour. Good roads greeted us through Titusville, where the entire population lined the streets to cheer us on our way. Out of Titusville we took the road leading along the Indian river. What a ride that was into Rockledge! For most of the way we were in sight of the majestic stream, whose other bank at this point was as distant and indistinct as is the Long Island shore from Connecticut. On its broad bosom floated white-winged yachts and saucy motor craft darted through its sparkling wavelets. Five miles from Rockledge we encountered an unbroken line of orange plantations with their pretty little cottages and boat houses in front of nearly every one of them. They impressed themselves upon us as the unostentatious homes of sport-loving men out for a good old winter time, loafing, sailing, boating and fishing.

Coco, a suburb of Rockledge, greeted us with waving handkerchiefs and raced with us in an opposition car to our destination at the New Rockledge Hotel. At this point we were first in the race. The Peerless had come from Ormond in 5 hours 25 minutes and had made a one-day run of 124.5 miles from St. Augustine in 8 hours 50 minutes' running time, which they say is a record for a run through Florida. Dr. Stinson

arrived with his Cadillac that evening, having made the 74.5-miles run from Ormond in about 7 hours 30 minutes.

Save for the 66-mile wind up stretch of fine coquina road from Palm Beach to Miami, the easy spots of our journey were now for the most part behind us. To be sure, we had nine miles of fairly good shell road in prospect at Melbourne, and shorter stretches of similar road at Sebastian and Eau Gallie. But for the greater part of the way there was sand to be ploughed through and rough forest trails to be tackled. Leaving Rockledge we had four or five miles more of good roads along the Indian river, past more orange groves, before we struck inland once more into the forest. At Grant, a settlement of less than half a dozen houses, they had erected a triumphal arch of flags and flowers and a dozen pretty girls were waiting with cameras to snap us as we passed beneath it. Mine Host of the resort hotel at Melbourne signaled us to stop and take aboard a basketful of toothsome luncheon. When we reached the Sebastian river Dr. Stinson, who had started a half hour ahead of us that morning, was about boarding the "county ferry." This was a scow fastened by rings to a wire stretching for a quarter of a mile or more to the opposite shore. In our honor, and for \$5 per car, a launch was on hand to tow the boat across. Normally it is a free ferry, each patron doing his own ferrying by pulling the boat across by the wire by hand. When the boat happens to be on the other side, the would-be passenger has to cross a distant railroad bridge and fetch back the boat. Claude Nolan had to do this at midnight. Remember, this is a wild country with an average of not more than three teams a day crossing the ferry. It was tantalizing for a "racer" to see his competitor sail away and get nearly a half an hour start before the boat placed his pursuer on the trail once more.

It was tough pulling in spots to get to Fort Pierce. In fact, on the very outskirts of our goal we were mired on the beach and had to dig and pull for a half hour to extricate ourselves. It had taken us eight hours to make the 75.4-mile run. At the Hotel Atlantic we forgot the food and lodging discomforts attendant on an excursion boat having swamped the town with travelers in the assurances of the sweet-voiced and sweet-faced daughter of the landlord that she knew that real gentlemen would not complain when they were told that they had done the best they could for them with the irresistible postscript, "Ah certainly do love New York, indeed Ah do, and Ah love New Yorkers too. They were so 'keind' to me and brother when we were there last summer."

The Fort Pierce folk tried to throw quite a scare into us about the day's run ahead of us to Palm Beach through the almost pathless forest wilderness. There was a labyrinth of entangled roads. There were morasses of mire. Strangers had been lost in the former and Laughlin had been stuck for two nights and a day in the latter. Despite all this, we disdained a guide and decided to go it alone and trust to the route book and signs Laughlin and Sebring had prepared for us. We certainly did have a time of it. We were in luck that it had not rained for several weeks or we would have had a worse time.

After less than five miles of riding we were once more in the heart of the forest with Jupiter 50 miles away and only one house intervening on the route. So far as the beauty of the surrounding pines and the balmy coolness of the air went, our ride through our first big forest was duplicated. This time, though, we had but a rough trail to follow. As we were bumping over the ruts and chugging through the sand in the heart of the vast forest we ran across a lone Seminole Indian. His pack of skins and camping outfit were hung on his back by a broad leather strap across his breast and a yachting cap surmounted his handsome pensive face; for these Seminoles are fine looking fellows. He carried his rifle swung across his forearm. He gazed with as near a look of silent wonder as an Indian can give at the strange devil machine; for this was Billy Tucker's first sight of an automobile. When we had convinced him in reply to his inquiry that a ride would cost him nothing, he climbed aboard with his pack. In answering his rather unsuc-

cessful interviewer, he said he had been out hunting and was on his way to his tribe at Lake Okeechobee, 25 miles away. He could walk 15 miles a day, he said. Despite the rough, miry road, we took him that distance in a little over an hour. When we reached that one lonely house in the forest, its truant were absent, but we invited ourselves to eat our lunch on the dining-room table and left a note of thanks for the owner's unwitting hospitality. Here Billy Tucker left us and struck off to the West to tell the denizens of the everglades of his wonderful adventure and doubtless be called a drunkard or a liar for his pains.

Now our troubles began for fair. Small lakes were quite frequent and mire almost incessant. One bit of it was too much for our motor and our muscles and we had to unship our block and tackle. It was a two hours' job to build a road of logs and palmetto leaves to give our wheels traction, while the Senator and the other three of us pulled for dear life on the ropes. An hour later we approached a pond. The guide book had warned us of a pond with a sign on the opposite side. This was it; but the sign, running parallel with our going, we did not see it from our side and so plunged into the pond. These ponds, remember, all have hard bottoms; some have deep holes requiring cautious navigation. On the bank to the right we saw the tracks of Dr. Stinson's car, and—alas!—followed them only to be mired just where he had been. In two hours, by digging and prying, we had made but six feet of progress. It was 6 o'clock then, and Wheeler, who had proved a giant of pluck and strength, was pretty well fagged out. It was a case of a night in the open. With our grips beneath our heads we slept the sleep of the weary, waking only at hour intervals to pile on more wood and draw nearer to the fire. We had to dig for drinking water.

At daylight we were awakened by Billy Harrison's shouting, "An automobile is coming." We could hear the chug-chug of the motor in the distance. No, we didn't have 'em, for in ten minutes Claude Nolan, who had started from Ormond a day and a half behind us, having waited that long for a new axle and having ridden for two nights and a day without rest, appeared at the other side of the pond. We warned him to stop. He had a guide with him. After a long conference and study of the ground, the Cadillac followed the directions of the pathfinders to keep on through the pond, swinging slightly to the right to avoid a deep hole and emerged in safety at the other side. Then came the job of getting the Peerless out of its predicament. The guide put through a plan that future tourists should remember. Our salvation was what he called a "Spanish Windlass." Let me tell you that it beats a block and tackle or a team of horses all hollow, and it is always available. There were no trees within reach, so 80 feet in front of the car he planted a stake, to which he fastened one end of the rope. Then half way between it and the car he planted another stake, around which he made a turn of the rope and a loop, into which he inserted a strong sapling pole he had cut. The other end of the rope was fastened to the axle of the car. Then two of us manned the sapling pole and walked around with it while two others pried up the car wheels with poles placed beneath the rear axle and hubs. We yanked the car out fairly easy.

"You can pull the bottom out of the earth with that," said the guide. He did not seem far wrong in the light of our experience.

Our subsequent troubles were as nothing compared to those just passed. After stopping an hour at Jupiter we set out for Palm Beach. It was a tiresome pull of 20 miles, fully one-half of it through deep sand. We emerged from the desert of Sahara and reached Palm Beach at 2 o'clock in the afternoon. The 66-mile run to Miami over the coquina road H. M. Flagler built two years ago, a highway familiar to many motorists by experience and most others by reputation, concluded the 372-mile run through Florida.

With stops at Ormond, Rockledge and Fort Pierce, the trip can be made in four days, though one had better count on five days, with a night's rest at Palm Beach, taking things in a little more leisurely fashion than we did during the race.

The Motorist's Gate to the Continent

By Stenson Cooke

Railway Yard at Folkestone

[All motorists crossing to the Continent from England are aware of the tedious and irritating formalities to be gone through on arriving at the other side of the channel. By the intervention of the Automobile Association of Great Britain all difficulties have been swept away. Charles Jarrott recently tested the arrangements.]

"HELLO! H-e-e-l-l-o! That the A. A.? That the secretary? Charles Jarrott speaking! Say, you're shouting a good deal about this touring department of yours and I am inclined to see what it really can do.

"This is Tuesday morning—I leave the Motor Club, London, on Thursday morning after breakfast, catch the mid-day boat from Folkestone, cross to Boulogne, and reach the Franco-Italian frontier at—never mind. I shall drive a four-cylinder, dual ignition, 40-horsepower car—for further particulars see small bills, which will keep you posted as to the minor details. I want a *triptyque*, a *permis de circulation*, eighty liters of petrol, tickets, a deck cabin facing south, and twenty pounds in French money. And I want a hole cut in the tariff wall of France big enough for me to drive through with a maximum of ease and a minimum of delay. Now, if the A. A.

Placed on Steamer's Deck

Petrol Removed Before Embarking

Now Every Day's Scene

AA Representative at Boulogne

not seek the assistance of such societies as the A. A. nor subscribe to its funds—at a decimal point per centum.

The motoring societies make motoring and touring easy.

Instead of shivering in a cold, bleak *douane* signing mysterious papers and paying over mystical amounts in French coinage, with an irritating impression of having been "had" over the rate of exchange, to say nothing of the haunting fear that some breach of circumlocutory law may involve entire loss of

Landing at Boulogne

touring department is all you say, let it establish a record, let it spread itself! I send you a cheque to cover deposits of duty, etc., and you do the rest. Now, make things hum! Good-bye!"

Be it explained here, for the edification of those who do not go down to the sea in motors, that foreign countries abound in tariffs. This is to say that you cannot sell an English or other strange motor car in France without first paying a duty of about a sovereign sterling per hundredweight "all in."

And in order that the tourist shall not go behind this protection by means of specious explanations, every car, good,

Petrol Supplied at Boulogne

and Away in Four Minutes

the money, the A. A. member in search of sunshine finds every difficulty smoothed.

He wants to go to Bordeaux and Biarritz, via Boulogne? Very well. Forms printed in plain, simple language are ready for him to sign. Deposits are taken at the offices in Coventry street, tickets issued, seats engaged, petrol commandeered; in fact, he and his car are carried about with all the directness and without the unpleasant "school treat" feeling engendered by the ordinary touring bureau.

He waves his A. A. permits in the face of humbled frontier officials and goes on his way rejoicing.

The system being almost perfect, all that remained was to beat every other system in the way of application—in short, to add to the million and one odd records for everything under the sun that of "clearing" a motor car through Boulogne, timed by a stop watch, and this is how it was done.

Copy of telegram from the secretary of the Automobile Association to the Marine Superintendent, Southeastern Chatham Railway Co., Folkestone:

"Reserve space Charles Jarrott car A.A.6000 First Service Boulogne April 2nd arrives 11-30 leaves 11-55 Deck cabin South aspect self and friends Move"

Reply to Fanum, London: "Right."

From secretary Automobile Association to Major Stevens, Gare Maritime, Boulogne:

"Charles Jarrott and car A.A.6000 arrive Boulogne first service April 2 en route Italy wants clearance permits circulation but no license make violent love French Customs establish record want eighty litres essence."

Reply to Fanum, London: "Right."

Thus did it come to pass that on Thursday, shortly after noon, as the S. E. & C. R. turbine steamer *Queen* rocked lazily by Folkestone quay within twenty minutes of her scheduled starting time, "C. J.'s" "Forty" drifted quietly between coal trucks and empty baskets onto a neat contrivance called a "stage." She was attacked by four deck hands, who lashed the wheels to corner rings while two others drained the petrol tank. A derrick then swung the car aboard.

Gold-laced officials (the chief of whom, Captain Hatton, had arranged for everything) looked on with complacency; they had nothing else to do. Once on deck the car was made snug—French numbers replaced English ones, and polite officers showed the way to the deck cabin facing south—one of the only two aboard. Here were daily papers, motor papers, cigarettes, soda water, and other necessities of civilization. So much for Folkestone.

At about 1:20, English time, a small army of baggy trousered democrats stood watching on Boulogne landing stage as the nose of the turbine cut a long white mustache in the sea two miles away. At 1:33 her steam ladyship nestled comfortably by the landing stage. Thence time was measured by fifths of seconds.

Before Charles Jarrott's party had passed down the gangway the car was deposited on the quay. Men clad in blue overalls rushed to the petrol tank with cans of essence and a wide-necked funnel. Gold-laced prototypes of Folkestone fluttered about with papers, gesticulated, advanced, retired, and set to partners. The A. A. official ran here and there, persuading the petroliers, coaxing the customs, making himself generally indispensable. Amid all the bustle stood Major Stevens, *chef de la gare Maritime*, spick and span and imperturbable, the personification of "Bond street in Boulogne."

Thanks to his admirable engineering, the hole in France's tariff wall had been widened to pass an English car through complete with certified papers, signed permit, and fuel for nearly four hundred miles, in record time, for Charles Jarrott waved good-bye and headed due south at 1:37—exactly four minutes from the moment the boat stopped.

It is not exaggeration to say that this record will not and cannot be beaten at any other continental port. The completeness of the A. A. touring facilities and the whole-hearted attention of the Southeastern staff combine to remove practically every difficulty which motorists in search of sunshine have hitherto encountered.

There is only one gate to the Continent, and Major Stevens commands the guard. The countersign is "A. A."

CHANGES IN FRENCH LAW AFFECT ONLY RECKLESS DRIVERS

PARIS, April 15.—There is to be a new automobile law in France, as everybody knows, but there is really no reason for the shrieking and protesting that have gone forth against the parliamentary work, for there will be no change so far as the average automobilist is concerned. Speed laws and regulations will remain as they are at present—generally a dead letter—registration is unaffected, and taxation has undergone no change. What parliament will do, supposing that the recommendations of the Public Works Commission are accepted, and there is every reason to believe that they will be, will affect only reckless and careless drivers. When an automobilist has been condemned by the judge of a criminal court to be deprived of his license, notification of the fact will be made by a central bureau to be appointed for that purpose, and neither by hook or by crook can a man so deprived obtain another ticket until the end of that time.

When this identification scheme was put forth it was proposed to record at the central office every condemnation pronounced against an automobilist, whether it was for running without a tail-lamp or for driving to the danger of the public, and condemn him to prison and the loss of his license for the third offense. This was manifestly unjust, for the three "offenses" might have been running without a tail-lamp, emitting too much smoke and using the siren in town. Now the indelible black mark will not be written down until the automobilist has been ordered to turn in his card to the proper authorities. Once the card is turned in, it will be impossible to enter an adjoining department and obtain a fresh ticket, for every licensing inspector must obtain assurance from the central office that the applicant is clear on the books

of that authority. Another detail modification which has its importance, instead of having to travel to the town in which he has been condemned, in order to personally hand over his driving card to the judge, the driver on the black list has the option of giving the ticket to the judge in the town in which he lives.

Under the first draft of the law a host of small employees were given power to summon automobilists for infraction of speed and driving regulations. Thus the humble stone-breaker on the roadside might have been making a note of your rear number to sent in to the police with a complaint that you had traveled past at 40 miles an hour; or the leisurely gamekeeper, with as little knowledge of motors and speeds as an infant, might have had the power of putting in an official complaint. This has been changed in the new recommendations, and only city police, gendarmes, officers in the Service of the Roads and Bridges, and engineers in the Service des Mines (the authority issuing driving licenses) have a right to interfere.

According to a circular just sent out by the Paris Prefect of Police, driving licenses issued in the district will in future cost \$4 each. Under the law in force for many years the only cost in connection with a license has been 12 cents for the stamped sheet of paper on which application is made. Under this regulation, power for which the Prefect declares is to be found in the financial law of last December, \$4 must first be paid to the tax collector before application can be made for a license. Workmen and servants earning less than \$40 a month can have the fee reduced to 50 cents. The regulation appears to apply to Paris and neighborhood only, all other parts of France remaining as before.

Latest News

two series of 372 miles on the following Monday and Tuesday. All machines taking part must be stock

vehicles of a determined weight and displacement, and will be given a limited amount of gaso-

line for the distance to be covered. The fuel allowance will probably be 15 miles to the gallon, as last year.

In case a profit is made on the race a return will be made to each competitor, proportionate to the entrance fee paid. As the circuit will be in perfect order, as the result of the Grand Prix, equipped with grand stands, barriers, bridges, tunnels, etc., it will be extraordinary if the management cannot succeed in clearing a considerable amount of money. The date chosen is the most favorable for a paying event, being at the height of the Dieppe season, the first week in August also being the

English holiday season when hundreds of Britishers travel over to the shore resorts in this part of Normandy.

It is quite possible that British cars will be well represented in the French fuel consumption race, owing to the greatly renewed interest that British makers are taking in international sporting events on the road.

H. S. HOUPT TO GO TO FRANCE WITH ROBERTS.

Harry S. Houpt, who gives his name to the company representing the Thomas interests in New York, has announced his intention to accompany Montague Roberts, who will alone represent this country in the next Grand Prix race to France, to act as his mentor and guide. No racing pilot has a more enthusiastic or sincere believer in his prowess than the youthful bearer of the Thomas racing colors has in this New York sportsman. Roberts carried the Houpt standard in the initial contest for places on the American Vanderbilt Cup team, and won what he strove for only to lose it through the committee's astonishing ruling that it had the right to go behind the results of the trial in the selection of the team.

Mr. Houpt's faith in Roberts was unbounded, and, largely through his urging, the young New Yorker was made the mate of Caillois and LeBlon in the elimination trials of 1906. In the 24-hour race at Brighton Beach last Summer, Roberts added force to Houpt's "I told you so" by winning. The present season he was chosen to pilot the Thomas New York-to-Paris car as far as Cheyenne, and now has been delegated to strive for added Thomas prestige in the Grand Prix. Others, in a word, seem to have come around to Mr. Houpt's way of thinking in the matter of confidence in "Monty" being rightly imposed.

Mr. Houpt will see to the engagement of training quarters for the Thomas one-man team, and will look after the practice for the big event. Not the least important factor in Mr. Houpt's decision to accompany Roberts abroad is his desire to be on hand to take part in the reception of the Thomas car at the conclusion of the New York-Paris race.

WHAT ONE EX-VANDERBILT RACER IS DOING.

CLEVELAND, April 20.—Patiently plodding along, with no hope of plunging along the race course again, with its gasoline supply cut down so fine that it keeps within the speed limits, an old Vanderbilt Cup racer may be seen puffing along the streets of this city almost any pleasant day. It is the Frayer-Miller air-cooled racer, which once qualified for the Vanderbilt Cup. It is now in the possession of W. B. Drown, who has charge of an auto supply store, and every day attracts a curious crowd of "auto fans." Drown expects to enter this freak in the free-for-all event in the hill climb this Summer, and there is a chance that he may take it around the country, racing wherever possible.

PARIS, April 18.—An addition of three more cars to the long list of racers entered for the Grand Prix has been assured by the decision of the Mors company to come back to the racing field. The racing cars were built several weeks ago, but owing to financial trouble they were not entered, and when the date for receiving engagements at ordinary fees had passed, it was considered certain that they would not be seen on the Dieppe course. The Mors company has now declared that it will enter the cars at double fees before the end of May.

The three drivers who have been chosen are Jenatzy, who has definitely abandoned Mercedes; Charles Jarrott, the English racing automobilist; and Langon, chief tester at the factory, who made his first appearance on a car in the Moscow-St. Petersburg race last year.

The Mors racers are four-cylinder cars of the maximum bore and about 160 millimeters stroke. They are chain driven.

Coupe de la Presse Also on Dieppe Circuit.

PARIS, April 18.—One month after the Grand Prix the Dieppe circuit will be the scene of another race, the Automobile Club of France having decided to hold its annual Coupe de la Presse on the fast triangular course in Normandy. A committee composed of members of the Dieppe municipality and deputies of the district waited on the Competition Committee of the A. C. F. last week, asked that the competition be held in their district and promised a subvention of \$2,000. Without wasting much time in discussion, the Club gave an affirmative reply, and announced the date of the competition as Sunday, Monday, and Tuesday, August 2, 3, and 4.

The Coupe de la Presse, the most important French touring competition of the year, will be remembered as the event that last year resulted in one of the most terrible accidents the automobile industry has ever known. One fatal accident on the road was followed by a more terrible one in which two cars traveling at 50 miles an hour met in a head-on collision causing the death of every person on board. The Government put a stop to the competition, and made it known that no more events would be allowed on the open road. It is because of this decision that the Coupe de la Presse, a touring competition based on speed and fuel consumption, is being held on a closed circuit.

Weighing-in will take place Friday and Saturday preceding the races, the small cars will compete over a distance of 372 miles on Sunday, August 2, and the heavy vehicles will run off

A SEASON OF CONTESTS IN PROSPECT.

If the number of contests now being planned by clubs all over the country may be taken as a criterion, there is little doubt that interest in automobiling as a sport was never keener than at the present. For numerous reasons, the track long since proved itself a field to which the automobile is not so well adapted as it is to competing along other lines, so that it is only natural that contests gradually have assumed other forms. One of the most popular of these is the hill-climb; at least, to judge from the number of these now on the calendar, and some of them are events of several years' standing. As a means of calling attention to the capacity of the automobile to travel long distances, the endurance run is deservedly popular, and several prominent events of this character are scheduled for early dates.

The ease with which what primarily appeared to be exceedingly rigorous conditions were met by the competing cars almost without exception, taken together with the fact that the idea was so thoroughly threshed out all over the country, caused the sealed bonnet form of contest to lose some of the favor in which it was held after the successful outcome of the first event of the kind, long before the end of the season which gave it birth. But there will still be sealed bonnet contests galore for all that, as witness the fact that there are some of them down on the calendar now in different cities. The automobile gymkhana has yet to take that hold on popular favor here which is so generally ac-

corded it on the other side, and particularly in England, though some of the clubs here have held very successful affairs of the kind. Taken all in all, the coming season will be one of contests, great and small, from one end of the country to the other. The eagerness with which such events are looked forward to by their participants, and the generous audiences that they never fail to attract, afford striking evidence of the growth of popular interest in automobiling.

The program of national events is small in number, due to the fact that the manufacturers who really pay the cost of these expensive contests do not care to participate too frequently. Not only is the money expenditure to be considered, but the resulting interference with the routine of the factory is another thing that carries much weight. Therefore, due to an understanding between the manufacturers' associations and the A. A. A., there will be only two more national events this year—the Fifth Annual Reliability Touring Contest for the Glidden and Hower trophies, in July, and the Vanderbilt Cup race, either in October or November. These two affairs, with the numerous local events, will do much to accentuate the importance of the industry and pastime and assist in its greater progress.

[CLEARANCE AS REGARDS HEIGHT OF BODY.]

One of the features that distinguished American cars of earlier days to their detriment, in more ways than one, was the extreme height at which the bodies were perched. This was erroneously regarded as representing an amount of clearance quite essential for traveling American roads, but the frequency with which some of those same cars got hung up on the differential, or struck some other part of their under work on obstructions, told quite a different story. A glance at what was considered to represent a design particularly adapted for rough road work often showed a car perched high in the air, with some of its most important essentials quite close to the ground, quite as close, in fact, as was true of much better-designed cars, the bodies of which did not serve to subject the car's tires to such terrific lateral strains, owing to their much lower center of gravity.

That American roads demand the maximum possible clearance consistent with good design, is something that cannot be controverted, but there are other equally inexorable laws of good designing, and one is that the center of gravity must be kept low. The higher the body is above the wheels, the higher the load must be carried, and this not only acts injuriously on the tires, but likewise reduces the safe speed of the car to a great extent. Last, but not least, the early American practice of placing the body high, regardless of the extent of the clearance, made an awkward-appearing machine, though few but experienced eyes could discern wherein the fault lay. Next to the high placed body, the one feature that makes a car look awkward and ill-proportioned is to have its radiator protruding forward of the front wheels. It is a matter of congratulation that the American designer came to realize that the little things counted some years ago, and that a car must have an attractive and business-like appearance, in addition to a capacity for reliability and endurance.

A. M. C. M. A. LEASES GRAND CENTRAL PALACE FOR SHOW

THE American Motor Car Manufacturers' Association has leased the Grand Central Palace and will run its own show there next winter. This announcement followed a meeting on Tuesday in this city of the show committee of the A. M. C. M. A. and the Motor and Accessory Manufacturers, Inc.

The official statement given out from the headquarters of the office of the independents declared that the Automobile Club of America had withdrawn from show promotion and that the exhibition next winter would be entirely under the management of the A. M. C. M. A.; and then tacked on a polite postscript by way of a courteous farewell and an easy let-down that officers and members of the club would serve on the show committees.

Representing the accessory makers at the meeting were: H. S. White, Howard E. Raymond, D. J. Post, Fred E. Castle and W. M. Sweet. Those in attendance on behalf of the A. M. C. M. A.

were H. O. Smith, chairman; R. M. Owen and S. H. Mora, of the show committee, and Benjamin Briscoe, president, and Alfred Reeves, general manager. A member of the accessory association, which will exhibit at the show, will be added to the show committee.

Conferences followed with members of the Importers' Automobile Salon, Inc., with a view of having foreign cars once more included in the annual Grand Central Palace exhibition, it being very generally conceded that the success of last year's independent exhibit of imported cars at Madison Square Garden was not sufficient to give much encouragement to repeat the experiment next year.

It was given out that the dates of the next show would shortly be announced. It was said after the meeting that no date earlier than January was favored.

CLUBS AND TRADE TO FIGHT NEW JERSEY LAW IN COURTS

NEWARK, N. J., April 20.—Organized automobilists in this State are to begin shortly a fight in the courts to test the constitutionality of certain provisions in the amendment to the New Jersey law recently signed by Governor Fort, and to other sections of the Frelinghuysen law of 1906 itself. The North Jersey Automobile Club has appropriated \$500, and cooperation is already assured from the New Jersey Automobile and Motor Club, the Automobile Club of Hudson County, and the New Jersey Automobile Trade Association. It is expected that other clubs allied to the Associated Automobile Clubs of New Jersey will join in the movement. In fact, it is inferred that George A. Post, a leader of the North Jersey Automobile Club, who has been chosen president of the State association, will call upon that organization to father and direct the legal battle, in cooperation with the State Trade Association.

One of the chief grounds of complaint is the fact that the law seeks to raise revenue for road repairs and the like by automobile licensing. The automobilists do not object to supporting the Department of Motor Vehicles by paying licenses, but argue that they already contribute toward road repairs by paying taxes on their cars as personal property. This they insist is unfair discrimination in favor of other users of the high-

way. There are several points which are believed to be vulnerable to attack and are naturally withheld from publication to avoid disclosing the probable lines of attack on the constitutionality of the law.

That the State Federation of Automobile Dealers will also join in the fight is emphatically stated by George Paddock, its president, who declares that the fight in the courts is but a part of the campaign his organization is starting.

"We are willing to join the automobile clubs," said he, "to test the constitutionality of the Frelinghuysen measures. There are two features for which we intend to fight. First, the recognition of foreign licenses in a reciprocal way; that is, to residents of such States as recognize the New Jersey numbers; second, the increase of the speed limit to 25 or 30 miles per hour. If, in attempting to gain these, we are able to work other reforms, so much the better.

"Motorists all over the State seem to think that bad faith has been shown by Senator Frelinghuysen and others in dealing with representatives of the automobile organizations, and that only by an appeal to the courts can justice be obtained. When the fight does start the best legal advice will be sought and no expense will be spared in carrying the case to a finish."

THE FEDERAL BILL IS NEITHER DEAD NOR DOOMED

WASHINGTON, D. C., April 20.—Automobilists, if they are laboring under the impression that the Federal Registration bill is either dead or doomed to die, want to disabuse their minds of any such erroneous idea. The American Automobile Association through its State organizations, its clubs, and its influential members is quietly at work answering the criticisms of its opponents concerning the constitutionality of the measure and bringing to bear arguments in its favor upon the members of the Judiciary Committee, which has the bill in charge.

An effort is being made to prove to Congressman and Chairman J. J. Jenkins that he was a bit hasty in the opinion he voiced in an interview, previous to the hearing on the bill, that the proposed law is unconstitutional on the ground of interference with the police powers of the States, and to impress upon him the force of the arguments advanced by Chairman Charles Thaddeus Terry, of the A. A. A. Legislative Board, at the hearing in question.

The Wisconsin State Automobile Association has taken upon itself to let Mr. Jenkins know what a large contingent of his

Badger State constituency thinks of the advantages of a Federal Registration law. Accordingly, last week Neal Brown, president, and James T. Drought, secretary, of the Wisconsin association, conferred with Mr. Jenkins in Washington. Mr. Brown having formerly been a State senator was thus aided in obtaining a patient and courteous hearing. Mr. Drought was emphatic in his statement that the bill was favored by every automobilist in Wisconsin and stoutly maintained that its provisions were merely a matter of identification and did not interfere in any way with the police power of any State.

"This measure," said Mr. Drought, "has both simplicity and clearness to recommend it. It does not violate the police power of any State. The sole purpose of the bill is to provide for registration and identification of motor vehicles engaged in interstate travel, so as to give to the owner of such vehicle the right of free ingress and egress in the various States of the nation without further registration and identification."

Chairman Terry was also in Washington during the visit of President Brown and Secretary Drought, and it is safe to say that the bill's chances have improved materially in the past week.

BRIARCLIFF RACE TO-MORROW.

The stock car chassis race for the Briarcliff trophy is scheduled to be run to-morrow over a course whose odometer measurement is 32.4 miles. The number of laps set to be covered is ten, though there is a bare possibility that, owing to difficulties the route presents and the doubt that exists as to the ability of the drivers to complete the race within the time limit of 8 1-4 hours set for the use of the roads, the officials may decide at the last moment to reduce the distance to 8 laps, or 259.2 miles. It is planned to start the race at 4:45 A. M., the twenty-two contestants being sent away at one-minute intervals.

Michelin Offers Two Complete Prize Series.

Both for the entrants of the winning cars in the coming Briarcliff trophy race, to be contested to-morrow, as well as for their drivers, the Michelin Tire Company is offering a complete series of prizes, amounting to \$2,250 in all. The only conditions

W. M. Hilliard and Hol-Tan-Shawmut Briarcliff Entry.

This car is a new quantity in racing, and its showing will be attended with much interest. Hilliard is one of the most experienced drivers in the country, though it is recognized that he is greatly handicapped with a car that has yet to be tried out. His most notable victory was the Mount Washington Climb of July 18, 1905.

are that the winning cars be equipped with Michelin tires. The first prize is \$500 in each case; second, \$300; third, \$150; fourth, \$100, and fifth, \$75, so that if the first car to finish be equipped with Michelin tires, it will be able to claim \$1,000 of the prize money, this amount being distributed equally between the entrant and the driver.

E. V. Hartford Adds to Briarcliff Prizes.

One of the latest additions to the already substantial list of prizes offered to the winning drivers in the Briarcliff trophy race, is the sum of \$200, to be taken in cash or plate, which will be given by E. V. Hartford, president of the Hartford Suspension Company, to the winning driver in the race, provided his car is equipped with the Hartford-Truffault shock absorbers.

PEOPLE WHOSE SAY-SO IS GOOD.

A. C. Newby, President National Motor Vehicle Company, Indianapolis, Ind.—“The automobile business in the West is good. While there has been a falling off in the volume of sales in the big cities, it has been pretty well offset by an increased demand in the smaller towns. That the interest aroused by the six-cylinder proposition at the shows has been sustained is proved by the proportion of the demands by buyers.”

Charles B. Shanks, Sales Manager, Winton Motor Carriage Company, Cleveland, O.—“Will we continue our exclusive adherence to six-cylinder car production? We certainly shall. The strongest argument with us is the readiness with which Winton customers have accepted the considerable advance in price the cost of manufacturing ‘sixes’ has entailed. Mr. Winton is so well satisfied with the outcome of his present six-cylinder design that he contemplates only trifling changes, if any, next year.”

✓ H. H. Franklin, President H. H. Franklin Mfg. Co., Syracuse, N. Y.—“Will automobile prices be lower next year?” is quite a general question. It is my opinion that the average price will be lower, but this does not mean that the price will be cut. It means that there will be more automobiles at a lower price. There will continue to be demand for the large high-priced machines, but this demand will decrease, rather than increase, whereas the demand for the moderate-priced and powered car will increase. The very big and excessively high-powered machines will gradually disappear, and in their place will be lighter, lower-powered machines, but because of refinement and reduced weight they will be as speedy.”

C. G. Stoddard, Dayton Motor Car Company, Dayton, O.—“Popularity, practicability, and perfectness have all combined to make the sliding gear transmission almost universal. The sliding gear gives a wide range of speeds, permits direct drive on the high or any intermediate speed without the other gears running, and thus gives, in a satisfactory manner, and with little friction, wide ranges of vehicle control. With the high-grade steel and hardened and ground gear teeth now used by many, the gears are double, and, being encased, run with the least possible loss of power, are protected from damage by outside obstacles, are out of sight and out of mind, and give the best of service in almost every instance, the exception being when some mechanical defect exists. In brief, the sliding gear transmission is reliable, strong, simple, and durable.”

Frank Briscoe, Brush Motor Company, Detroit, Mich.—“Discrimination in freight rates by the railroads is one of the predominating drawbacks of the automobile industry. Especially is the matter of freight rates discouraging to the maker of small cars and buggyabouts. There is no sane reason why the automobile should not be shipped as cheaply as carriages. The small cars could easily be knocked down, the body and running gear shipped as a carriage and the motor billed as an engine, just as marine engines are shipped; thus saving the buyer a snug little sum on transportation rates. The freight and transportation committee of the American Motor Car Manufacturers' Association have this matter in hand, and should be supported by all manufacturers of cars, regardless of trade affiliations. When the freight rates are amicably adjusted, then the first cost of the automobile will be materially reduced.”

CLEVELAND TO HAVE OAKLAND TAXICABS.

CLEVELAND, April 20.—At last it has been definitely settled that this city is to have taxicab service, and a company is being organized to hurry matters along. The Oakland, a car new in this city, will be the one used in the cab service, and arrangements are now under way to bring a large number of these vehicles here. Quarters have been secured at the Metropolitan Car Co. The original idea was merely to establish an agency for the Oakland in this city, but after two or three trips to the Oakland factory at Pontiac, Mich., Milton A. Hughes became convinced that the taxicab field was one needing attention.

WHAT IS GOING ON AMONG THE CLUBS.

HARTFORD CLUB IN PERMANENT QUARTERS.

HARTFORD, CONN., April 20.—The Automobile Club of Hartford is now located in permanent quarters in the Allyn House. President Fuller has announced that hereafter the club lunches will be held on Fridays instead of Wednesdays. The clubroom will be in charge of the assistant secretary and visiting motorists will find the latch string out and every courtesy will be extended to them. The local club now has what it has required for a long time, a home of its own in the midst of most congenial surroundings.

The contest committee of the automobile club Saturday made a preliminary run over the course selected for the endurance run of May 16. T. Dudley Riggs, with his 70-horsepower Simplex runabout, blazed the way. S. A. Miner provided a 30-horsepower water-cooled Knox, also a 22-horsepower two-cylinder Buick; R. D. Britton was on deck with the little two-cylinder Maxwell, and T. Dudley Riggs also provided a Simplex touring car. "Len" Fiske was much in evidence in the water-cooled Corbin. Start was made from City Hall at about 11:15 with Middletown as the first stop on the route. After a short stop the run was continued to Meriden, and the roads between the two points were in some spots poor. From Meriden the trip was continued to Southington and Waterbury, and the run over Southington Mountain was a little strenuous as the roads have not yet been put in shape. Waterbury was reached and stop was made at the Elton for lunch, and the trail blazers had a merry time of it. On the way to Bristol every car in the procession easily disposed of Plymouth Hill, one of the toughest and steepest grades in the State. Bristol was made without incident, and the run was continued to New Britain. Here it was decided to continue on the Farmington and Avon instead of going direct to Hartford. The run over the Avon Mountain was rendered the more difficult owing to the heavy rain, which started to fall when New Britain was reached. When the party rounded up at the Miner garage it was agreed that when two circuits of 87 miles had been made of the route traversed, the average driver of a car would feel that he had had about all he wanted for one day. The time of the Simplex, the largest car in the run, was 3 hours 30 minutes, that is actual running time for the 87 miles.

PIKE CAMPBELL PRESIDENT LOUISVILLE CLUB.

LOUISVILLE, KY., April 20.—George H. Wilson, who has been president of the Louisville Automobile Club for four years, has retired from the office. Pike Campbell has been chosen in his place. The other officers elected at the annual meeting were: First vice-president, J. H. Ross; second vice-president, J. B. Lewman; secretary, Eugene Strauss; treasurer, Walter Kohn. Prince Wells was elected a director in the Kentucky State Automobile Association.

Various reforms and plans for the future were discussed at the meeting. W. O. Barnie, who has recently joined the club and is a member of the Board of Park Commissioners, promised to use his best efforts toward securing for automobilists their rights in the parks. An effort will be made to have the toll rate on the Kentucky and Indiana bridge reduced.

A tour to Frankfort for the annual meeting of the Kentucky State Association was proposed and favored.

LAND AND WATER MOTORISTS FORM CLUB.

PADUCAH, KY., April 20.—The Paducah Automobile Club has been formed and chosen the following officers: President, Joseph R. Grogan; first vice-president, Fins Lack; second vice-president, P. H. Stewart; secretary, Roy O. Gressham; treasurer, Richard Ruddy. These with Jesse Weil and Benjamin Weile constitute the board of directors. The club starts with 30 members, included among whom are owners of gasoline launches and motorcycles. It is planned to join the A. A. A. State Association.

CONTESTS FOR THE TWO CHICAGO CLUBS.

CHICAGO, April 20.—Tentative routes for the 1,200-mile, four-day reliability test of the Chicago Motor Club, which will be run June 24-27 inclusive, have just been issued. As outlined by Chairman Root, the contestants will be required to cover 1,184 miles in four days, or an average of 296 miles a day. The routes in question take in everything within a radius of 150 miles of Chicago. More than 100 prominent towns are included, besides 100 smaller places. Average of 292 miles the first day, 322 miles the second, 279 the third, and 291 miles on the fourth day are indicated by the tentative routes now under consideration.

Another event, scheduled to take place June 6, is a roadability test, similar to the one run in Philadelphia on April 11. The Chicago Automobile Club has decided to promote this contest in connection with the club run to Gary, Ind., to inspect the steel mills now in course of construction there.

ENDURANCE RUN FOR NORTH JERSEYMEN.

PATERSON, N. J., April 20.—George A. Post, who has been elected president of the Associated Automobile Clubs of New Jersey, has retired from the presidency of the North Jersey Automobile Club. Robert Beattie, of Little Falls, has been chosen in his place. The other officers elected at the annual meeting were: First vice-president, Dr. J. H. Faulkner; second vice-president, Benjamin Eastwood; secretary and treasurer, James Madden, Jr., of Little Falls; captain, Dr. George E. Layton; first lieutenant, W. B. Froude; counsel, Jacob Vanderlock.

It was decided to hold an endurance run on Saturday, May 16, consisting of four laps of 25 miles each, the contestants entering the suburbs of Paterson on each lap. The contest will be on a stop penalization basis. Each car will carry an observer.

BAY STATERS WILL HOLD MAY 30 RACES.

BOSTON, April 18.—The Bay State Automobile Association's racing committee has decided to hold the annual race meeting of the association on Memorial Day, May 30, at the Readeville track. The plans for the races have not yet advanced far enough for any of the particulars to be decided, but the committee has begun the work of preparation.

Another important local event which was decided this week is a general meeting of the Massachusetts State Automobile Association to be held in Boston on Saturday, May 2. President William H. Hotchkiss, of the A. A. A., has been invited to attend.

MORE CLUBS FOR CONNECTICUT ASSOCIATION.

HARTFORD, CONN., April 20.—There is a desire to form an automobile club in the town of Manchester, ten miles from Hartford. There are many cars in the town, and it is quite likely the organization will be effected in time to join the Connecticut State Automobile Association. If such a course is followed the matter will be brought up before the meeting of the board of directors, who meet at the New Haven House, New Haven, April 22.

WILLIMANTIC, CONN., April 20.—As the result of the efforts of a small body of progressive autoists, the Willimantic Automobile Club has been organized with a charter membership of 25. The officers are: President, Dr. John Weldon; vice-president, J. B. Fullerton; secretary, L. B. Lincoln; treasurer, E. F. Whitmore.

OHIO BODY REVIVIFIES COLUMBUS CLUB.

COLUMBUS, O., April 20.—At a meeting of the more enthusiastic motorists of this city held here last night, the Columbus Auto Club, long since defunct, was brought to life. When fully organized, the local club will have a membership of over 250 and will be an active member of the Ohio State Automobile Association of the A. A. A.

NEW PACKARD MAKES ITS DEBUT IN COMMERCIAL FIELD

AFTER having worked on the problem of the medium capacity commercial truck of the gasoline-driven type for five years, the Packard Motor Car Company, Detroit, Mich., is now placing on the market the result of this development. It goes without saying that it embodies all the time-tried features of Packard

storage battery and single vibrator coil, while the Packard circulating system of lubrication is employed complete. Control is by means of a throttle lever on the steering wheel, a pedal accelerator and an automatic governor. In fact, when it is said that the newcomer is essentially Packard, that suffices to describe it, as the entire transmission is designed along the same lines as those that distinguish the same part of the Packard car. The same internal expanding type of clutch is employed, with a propeller shaft drive to a three speed and reverse sliding change gear, combined with the differential in a special housing, together with a countershaft. From the latter final drive is by means of side chains to the rear wheels.

The braking system is similar to that of the pleasure car, the running brake being pedal-operated, while a hand lever is employed for the emergency. The front wheels are 34 inches in diameter, shod with four-inch solid tires, while the rear are 36 inches and shod with four-inch tires. The wheelbase is 144 inches and the tread 68 inches. Exceptionally large and heavy steering knuckles are provided, the front axle

New Representative of the Packard Line in the Commercial Field.

being a hammer-forging from solid steel. The platform back of the driver's seat measures 6 feet by 12 feet 4 inches, giving 74 square feet of floor space, which is of hard wood, shod with iron protecting strips. The weight of the chassis is 5,000 pounds and the maximum speed 12 miles an hour. The finish is Packard blue and cream yellow, and the truck lists at \$3,850 complete, with stake body, special types being supplied to order.

construction, modified to meet commercial vehicle requirements. This new Packard truck has a capacity of three tons and is designed to be serviceable over a wide range of hauling, as it provides ample carrying space. Its power plant consists of a 41-2 by 51-2-inch, four-cylinder motor, with a Packard type water-jacketed carbureter, a high-tension Eisemann magneto for ignition, supplemented by a

being a hammer-forging from solid steel. The platform back of the driver's seat measures 6 feet by 12 feet 4 inches, giving 74 square feet of floor space, which is of hard wood, shod with iron protecting strips. The weight of the chassis is 5,000 pounds and the maximum speed 12 miles an hour. The finish is Packard blue and cream yellow, and the truck lists at \$3,850 complete, with stake body, special types being supplied to order.

STUDEBAKER ADDS SUBURBAN MODEL OF PLEASING LINES

AS has been the case all along where the lines of the Studebaker chassis are concerned, the designers have adhered to conservative models in body building as well, and the Studebaker is one of the last to yield to the demand for a type other than those that have prevailed as standard for some years past. To comply with this call for something that is neither a runabout nor a touring car, but one that combines the light weight and smartness of the former with the extra seating capacity of the latter, a new model, the pleasing lines of which are shown by the accompanying photograph, has been added to the Studebaker family.

It has been given the title of the Studebaker "Suburban," and is built on the same 30-horsepower chassis as the Studebaker Models A and H. The body of the car is considerably shorter than the regular touring type of the same power, and this, together with the low side doors, gives it a very smart appearance. As will be noticed in the illustration, special provision is made for carrying a

trunk in the rear, and, while the car has been particularly designed for what is familiarly known as "suburban service," comprising trips between the railway station and house, it is evident that it would also form an excellent car for touring, owing to its light weight and ease of handling.

Pleasing Lines of the New Studebaker Four-seated "Suburban."

BRIEF ITEMS AND TRADE MISCELLANY

The idea is unique, in that the magazine will contain many unbiased articles prepared by physicians for the benefit of fellow members of the profession who may be considering the purchase of cars.

The St. Joe Motor Car Company, Elkhart, Ind., has begun operations at its factory on Main and Simonton streets, with a force of 15 men. This is the concern that purchased the assets of the defunct Shoemaker Automobile Company, which recently went into the hands of a receiver.

The St. Louis Car Automobile Company, of New York City, has been incorporated with a capital stock of \$20,000. The organizers are John F. Valieant, Louis A. Hopkins and Walter S. McCall. The concern is the New York representative of the St. Louis Car Company, St. Louis, manufacturers of the American Mors.

In the notice which appeared in a recent issue concerning Gre-Solvent, the address of the manufacturers, the Utility Company, was wrongly stated. Instead of 332 Broadway, it should have been given as 636 West Forty-fourth street, where the factory and executive offices of the company have been located for some time past. Requests for free samples should be sent to this address.

Physicians in all parts of the United States are now cooperating with Thomas B. Jeffery & Company in the preparation of a special physician's number of the *Rambler Magazine*, which will appear on the first of May. This number will be written, edited and profusely illustrated by the efforts of American doctors who have used the Rambler in their practice for years.

Thomas W. Lawson, the Boston banker of "Frenzied Finance" fame, has just become the owner of a 50-horsepower, 1908 Matheson touring car. The sale is quite a sheaf in the cap of the builders of the Matheson, as with his accustomed thoroughness in doing things, Mr. Lawson has had a corps of experts examining and testing most of the prominent makes of foreign and American cars for some time past.

In the series of portraits of the competing drivers who will take part in the Briarcliff trophy race to-morrow, and which was published in last week's issue of *THE AUTOMOBILE*, Michener and Mulford were erroneously put down as handlers of Stearns cars, whereas they will handle Loziers in the race, both drivers having figured prominently on numerous occasions at the steering wheel of the Lozier.

The Thomas Detroit *Snow Bird* that made a successful 3,000-mile midwinter trip, minus all its gears, returned to Detroit last week where it received a rousing reception. It is entered in the Detroit endurance run, April 29-May 1, and after the completion of the latter, it will again go to Chicago, where it will take part in the Algonquin hill climb. From Chicago the car will go to Wilkes-Barre, where it is entered in the Giants' Despair hill climb.

During the past week all the Cleveland factories have been busier than ever before at this time of year. This is true of all makes of cars—gasoline, steam, and electric. The Peerless Company's statement for March shows that that concern is far ahead of the business done a year ago in

the same month, while the F. B. Stearns Company, through its purchasing department, is laying in supplies to build 20 per cent. more cars than it originally intended. These are but instances, but they show the trend of business conditions.

Two or three weeks ago, the Warner branch office in Detroit, located at 239 Jefferson avenue, was broken into and over \$1,200 worth of Auto-Meters stolen. George Weidner, the Detroit representative, did some "sleuthing" on his own account, and traced the burglar to Cleveland, where he was arrested. He confessed to having sold the loot to Robert Wachmann, of the Wachmann Motor Manufacturing Company, Detroit, for \$18. Upon being granted immunity, Wachmann confessed, and the Auto-Meters were found buried in a lot of hay in the rear of a store.

The Swinehart Clincher Tire & Rubber Company, of Akron, O., has begun an action in the United States District Court in Cleveland against the Motz Clincher Tire & Rubber Company, of Akron, asking an injunction to restrain the defendant company from manufacturing and selling tires bearing the side indentation feature. This the Swinehart company asserts is covered by Patent No. 826,622, granted to J. A. Swinehart. The side indentations are used on solid tires to secure greater resiliency. Damages are also asked by the Swineharts. This is one of several similar suits by the Swinehart company against the Motz company.

RECENT TRADE CHANGES.

The New York office of the Duff Manufacturing Company, of Allegheny, Pa., has been removed from 26 Cortlandt street to the Hudson Terminal-Fulton building, 50 Church street.

C. S. Henshaw has just opened his new headquarters at 288 Columbus avenue, Boston, Mass., which building he previously occupied for three years. He will represent the Haynes Automobile Company, Kokomo, Ind., in the New England territory.

Another change of the Thomas representation in Philadelphia took place last week, when H. L. Lane was made manager of the L. J. B. Motor Car Company, local agents, at 139-141 South Broad street, succeeding "Joe" Keir, former Renault agent.

The Traver Blowout Patch Company has just removed to its new quarters in the Thoroughfare building, 1779 Broadway, New York City. The company has also been reorganized, the officers now being, president, James Caffrey; treasurer, M. L. Nuemoegen; secretary, L. T. Walter, Jr., and manager, John F. Sussillo.

NEW AGENCIES ESTABLISHED.

Theodore Crossley has been appointed agent for the Oldsmobile line at Riverside, Cal., and the neighboring territory.

The Cuyahoga Motor Car Company will in future act as the agent of the Studebaker line in the East End, Cleveland, O.

When the Fairmount Engineering Works removed its factory from Philadelphia to Pottstown some weeks ago, it became necessary to arrange for the representation of the Chadwick car in Philadelphia

through an agency. Last week a deal was entered into with the Wildman Motor Car Company, of 254 North Broad street, to handle the Chadwick line in the Quaker City and vicinity. It is the first appearance of the Chadwick in a "Row" establishment, the Philadelphia retailing end having hitherto been carried on at the old Spring Garden street factory.

C. G. Bleasdale, factory representative of the Maxwell-Briscoe Motor Company, has placed the agency for the Maxwell line with the Ohio Motor Car Company, in Euclid avenue, Cleveland. This will be converted into a new Maxwell branch, and will be known as the Maxwell-Briscoe-Cleveland Company, and will be under the management of Mr. Bleasdale, assisted by G. F. Russell. Mr. Bleasdale has had temporary quarters in the Tabernacle garage for some time past and has placed several agencies in the State, besides one in the East End, with the Wentworth Motor Car Company.

PERSONAL TRADE MENTION.

F. W. Walters, formerly with the Pennsylvania Rubber Company as general sales manager, has resigned his position with that concern.

John Wilson Drown, formerly publicity manager of the Corbin Motor Vehicle Corporation, has accepted a like position with the Standard Roller Bearing Company, of Philadelphia.

Russell H. Baldwin, formerly with the Connecticut Electric & Telephone Company, Meriden, Conn., has recently gone with the Timken Roller Bearing Axle Company. Mr. Baldwin is a valuable addition to the Timken sales organization.

G. B. Sharpe, advertising and publicity manager of the Garford and Studebaker companies, will remove his offices from South Bend to Cleveland, O., where he will be associated with Al Davis, sales manager of the Garford Company.

W. H. Yule, assistant manager and one of the directors of the Badger Brass Manufacturing Company, has recently resigned from that company and accepted a position with the B. F. Goodrich Company, Akron, O. In his new capacity Mr. Yule will be the manager of the Haskell golf ball department. Mr. Yule is a Harvard man and has long been prominently identified with the sport of golfing.

WILLIAM L. GROUT DEAD.

GREENFIELD, Mass., April 20.—William L. Grout, the wealthy sewing machine manufacturer, died here at the age of 75 years. Mr. Grout began business something like half a century ago, at Templeton, with Thomas White, later of the White Sewing Machine Company, on a joint capital of \$400. A few years ago, he backed his sons in the business of building automobiles, the car being known as the Grout. Steam cars were first turned out, but they were abandoned later, and a gasoline car assembled. Last year, Mr. Grout objected to the manner in which the business was being handled and withdrew his backing. The sons then separated, Carl Grout now being in Boston; Fred Grout in Oklahoma, and C. B. Grout in Los Angeles, Cal.

INFORMATION FOR AUTO USERS

Atwater Kent Gasoline Measure.—This consists of a 12-inch boxwood scale which is graduated in inches and may be used to determine the depth of fuel in a tank. It is shellacked to make it proof against the action of the gasoline, and the black strip is given a gasoline-proof dull finish, resembling the surface of a blackboard and turning glossy when wet, thus showing clearly how high the fuel is. Carrying one of these measuring sticks in the tool box avoids the necessity of resorting to the first thing that comes handy with which to measure the amount of fuel, thus introducing dirt into the tank. These gasoline measures will be supplied gratis to any automobile owner upon request, by the Atwater Kent Manufacturing Works, 50 North Sixth street, Philadelphia, Pa., manufacturers of the well-known Atwater Kent spark generator, an ingenious piece of ignition apparatus that has come prominently to the front of late, through its good showing in efficiency tests.

ATWATER KENT FUEL METER.

Cleveland Spark Plug.—This is a new type of spark plug, one of the most striking features of which is the spiral, doubly-insulated core. According to the manufacturers, the Cleveland Spark Plug Company, 940 Power avenue, Cleveland, O., the spiral terminal of this core has two functions. Owing to its peculiar form, it is claimed to act as a condenser, greatly intensifying the heat of the spark, with a decrease in current consumption. It also sets up a centrifugal whirling action of the burnt gases, depositing the carbon on the inner wall of the outside shell. Another important feature, according to the makers, is the auxiliary combustion chamber, which "shoots a flame" into the mixture in the combustion chamber, thus insuring complete combustion of the charge and maximum output of power. Only the very best materials are employed in its construction, while every part of the plug is finished to micrometer gauge, thus insuring a perfectly gas-tight fit. Mica is employed for the insulation of the spiral core as shown by the accompanying illustration.

SECTIONAL VIEW CLEVELAND PLUG.

The Giant Warner Auto-Meter's Travels.—Last year, the giant Warner Auto-Meter traveled from Vermont to Washington, D. C., and in so doing covered more than 10,000 miles. It is now at the factory of the Warner Instrument Company, Beloit, Wis., being overhauled for its 1908 jaunt. It was a favorite stunt of the driver of the Stoddard-Dayton carrying the huge instrument, Jason de Silve, to drive through the streets of a city at its legal rate of speed, 8 or 10 miles an hour, and in every case he effectually succeeded in completely impeding all other traffic, so that the big instrument has brought home to many people how absurd their speed laws really are. With its aid, de Silve proved to the satisfaction of many local authorities that every moving vehicle on

GIANT AUTO-METER IN THE SNOW.

the streets violated the law. The town of Pittsfield, Mass., was one of the first to change its speed regulation as the result of the eye-opening testimony of the big Auto-Meter. The huge instrument stands 9 feet 6 inches, weighs 800 pounds, and is exactly 1,000 times larger than the instrument used on a car.

Keystone Grease for Autos.—Having achieved an unapproachable reputation in the steam engineering field, the Keystone Lubricating Company, Twentieth street and Alleghany avenue, Philadelphia, has decided to enter the automobile trade and will sell direct to the garages and consumers on a fixed price scale. It is only necessary to consider the enviable record that this lubricant has made for itself wherever employed to realize that it will be but a short time before it achieves a similar measure of success in its application to automobile lubrication, which, in many respects, has not assumed the status of a definitely understood science, by any means. In large engineering establishments which conduct operations on a vast scale, and of which the William Cramp & Sons Shipbuilding Company may be cited as a notable example, the choice of a lubricant is not made haphazard, though this is usually the case where the selection of the material for this most essential factor in the maintenance of an automobile is concerned.

To be approved by such a firm, the lubricant submitted must pass a most rigid scrutiny on the part of chemists retained especially for this purpose, and unless it does so, it goes no further. If it is found to be entirely free from all deleterious substances, it is then submitted to equally searching efficiency tests in special machines and its qualifications for the service intended are searchingly gone into. To pass through such an examination successfully, a lubricant must be all that is claimed for it, and the fact that Keystone grease

has been adopted by a large number of such establishments speaks for itself. In the case of the Cramp company, it was not only found to meet all requirements, but proved more than 100 per cent. more economical than its nearest competitor, owing to the fact that it preserves its

HOW KEYSTONE GREASE IS PACKED.

original consistency under all conditions and does not depend upon the temperature of the bearing for its lubricating properties. The Cramp tests showed its coefficient of friction to be .00340, as compared with a record of .00706 for its next best competitor. The Keystone Lubricant Company has now been manufacturing grease for more than a quarter of a century, and its plant at Philadelphia has a daily capacity of 20,000 pounds of lubricant, so that its introduction into the automobile field was bound to come sooner or later. The grades especially adapted for automobile lubrication are known as "No. 1 Density," a solid lubricant intended for use in automatic spring compression cups on axles, water pumps and other small bearings requiring a solid grease, and "No. 3 Density," which is semi-solid, and is intended for gear boxes and differential cases.

Chase-Shawmut Portable Lamp.—"A small amount of light properly directed is much more serviceable and incidentally more economical than a great deal of light uniformly distributed," say the makers of a new portable electric light for automobile use, the Chase-Shawmut Company, Newburyport, Mass. This new battery

PORTABLE ELECTRIC FOR TROUBLE HUNTING.

lamp is small, convenient and very neat in appearance. The lamp will pass through a 1/8-inch hole and is so designed that the light is thrown on the work, and not into the eyes of the holder. The bulb is so completely protected by the tubular reflector that the lamp can be stored in any convenient place. Looking for gasoline troubles with such a light becomes a pleasure, rather than a menace.

THE AUTOMOBILE

THE BRIARCLIFF TROPHY

1	Strang	Isotta,	5 hrs. 14 min. 13 $\frac{1}{2}$ sec.
2	Cedrino	Fiat,	5 hrs. 21 min. 05 $\frac{2}{3}$ sec.
3	Vaughan	Stearns,	5 hrs. 28 min. 29 $\frac{2}{3}$ sec.
4	Lytle	Apperson,	5 hrs. 39 min 15 $\frac{2}{3}$ sec.

Strang Taking a Turn Without Hesitation, and Cautiously Descending a Corkscrew Grade.

BRIARCLIFF WAS HARD-FOUGHT AND SPECTACULAR

By A. G. BATCHELDER.

BRJARCLIFF unquestionably demonstrated the roadability of those automobiles which participated. And true roadability demands much when it must be proven in such an event as the contest for the Briarcliff trophy, held over the picturesquely tortuous highways of Westchester county, N. Y., Friday, April 24.

So closely did the leading half-dozen mechanical contenders finish that the finding of the winner resolved itself into a question of personal equation. Strang, an ebullient and typical type of Americanism, born in Amsterdam, New York State, snatched the high honors by guiding a semi-racing product, imported from Milan, Italy. This car possesses a name pleasingly reminiscent of the land of art and olives and spaghetti, and it is a double-header: Isotta-Fraschini. Sturdy Strang had won with it at Savannah some few weeks previous, and his confident yet skilful piloting of the crimson-hued craft had caused his being picked by the wisecracs as the most probable winner of the twenty-two Briarcliff candidates. It is now a matter of history that he upheld this good opinion of his admirers, and in the success scored he deserves equal credit with the specially constructed car which he drove.

Cedrino, with another special made semi-racing car, was expectedly a most determined opponent, and it may be that he would have gotten closer to the leader if the race had been prolonged to the original ten circuits. But it is a pretty good guess that if Strang had been forced to do so, he could have gotten a sufficient amount of speed out of his smooth running Isotta to have retained the advantage.

As an actual matter of fact a large sized wreath of the laurels belongs to Guy Vaughan and the Stearns stock car which he drove. Engine troubles were nil, but tire experiences were unfortunate. And in this matter of tires, an element of luck was bound to exist over such winding, racking stretches of good, bad, and indifferent roads. Of the tire difficulties not a few could be traced directly to the inconsiderate manner in which drivers savagely went at some of the most abrupt turns.

Fourth to finish was "Herb" Lytle, whose consistency kept him among the quartette of leaders in every lap except one. Had it not been for an exasperating final run, he might have occupied third place. But one might also say that if Vaughan had not had his misfortunes, he might have actually won.

Unofficially fifth place belongs to Seymour and his Simplex, and likewise, unofficially, sixth place can be fairly claimed by Leland and a Stearns. Officially Sartori and the Bianchi get the honor, for it was after the clockers of "Sammy" Butler had suspended operations that Seymour and Leland forced their way through the straggling mob which had taken possession of the course immediately after the Bianchi had finished.

Guy Vaughan, Driving Stearns, Finishing Third.

While it is true that Nature supplied a course rather easy to police, it is a surmise that Providence must have lent aid to the volunteer soldier boys, who were more youthful looking than impressive without their uniforms and guns. There certainly was much for congratulation in the fact that the onlookers repeatedly displayed sufficient agility to keep out of the path of the flying cars, for in many instances it was more owing to their own activity than to the farcical authority of the cane-carrying soldiers that nothing serious happened.

The decision of William K. Vanderbilt, Jr., that no race for his trophy shall take place except over a properly guarded course—which means the presence of uniformed men armed with authority—still remains a logical and sensible decision.

Despite some daily newspaper reports to the contrary, it is a certainty that not half as many people saw the Briarcliff race as witnessed the 1906 struggle for the Vanderbilt cup. Had the very inadequate railroad facilities of reaching Westchester County been equal to the capacity of the Long Island transportation channels, thousands more would have journeyed to the Briarcliff event and would have added to the perils of the racers as well as to themselves. Therefore, it was most fortunate under the circumstances that the course was far less accessible than the one in Nassau county.

But the next race for stock chassis should have rules far more carefully drawn than those which governed the Briarcliff event. The manufacturer who enters such a contest should decline to do so unless confident that he will be fully protected from competing against cars of special construction, made in limited quantities, and in reality deserving the designation of racers.

Herewith are extracts from 1908 A. A. A. racing rules, drafted by a sub-committee, including S. A. Miles, Alfred Reeves, and A. L. Riker:

"Stock Car."—A motor car completely described in the manufacturer's catalogue for the current or any preceding year, which is manufactured in quantities, of ten or more, which is on sale by the regular selling representatives of the manufacturer and is manufactured ready for delivery to buyers.

"Stock Chassis."—A chassis which, without any change whatsoever, except that lighter gear springs may be used, can, by adding the necessary parts, be assembled into a complete stock car for which it is designed.

It is furthermore known that the technical board of the A. A. A. is going to add a few recommendations which may help to some degree in making stock car events exactly what they are intended to be: demonstrations to buyers of cars which can be bought at any time. It might be a good idea for the technical committee of the next stock chassis race to visit the factories of the entrants and in the assembling room pick out and stamp an entire car or its essential parts. This would make unfair advantages impossible and eleventh-hour protests unnecessary.

It should be said, however, that the Briarcliff race, in spite of its defects, would have been worth while if it had only demonstrated—as it did—the roadability of the average modern automobile. Such a vigorous examination could not have been accomplished scarce a year or so ago, and the searcher for mechanical fitness can find much to please him in a study of the Briarcliff summary.

Invading a county which was presumably desirous of giving a course for the race, Chairman R. L. Morrell and Secretary T. F. Moore and the committeemen encountered much opposition, which even prolonged itself until the midnight before the morning of the race. But difficulty after difficulty was smoothed out, hold-up after hold-up was met, and finally the road in front of the grand and official stands was sufficiently clear to enable the energetic Wagner to get the flying procession under way.

IT was not until 4:16 A. M. that Chairman Robert Lee Morrell and Secretary Thomas Francis Moore arrived at the grandstand. With the hour of the start—4:45 A. M.—less than a half an hour away, an appalling problem faced the promoters. Despite the fact that it had been announced that the course would be closed at not later than 3 o'clock, the home stretch was packed with scores of cars, whose occupants were begging to be told how to get to the official grandstand and the parking spaces. The roadway was a mass of pushing, jostling people. Newspaper men were calling for "Schwartz," and blindly seeking their allotted seats. Telephone men were adjusting wires and setting up transmitters, and telegraph linemen were connecting instruments. On the grandstand, located on the hillside above, ushers with lanterns were helping early comers in their search for boxes and seats. Bands of boisterous militiamarshals were pushing their way through the crowd to their stations, yelling with delight at this new lark of race-course guarding.

Sartori, who was to be the first starter, arrived at 4:22 o'clock and pushed his way to a place near the tape. Other contestants were behind him, but swallowed up in the human maelstrom that surged through the narrow home stretch. That the start could not be made on time was certain. Whether the race could be started at all was a problem. Starter Wagner plunged into the crowd, and began at once his task of getting the cars in line. He has hustled before. He never hustled and fought as he did this time. He was doing his work all right, all right.

With the time of the start but ten minutes away, the course was a mass of seething humanity. Talk of calling off the race entirely came from the group of naturally despairing officials. Something had to be done. Harry Burchall, chief of the marshals, proceeded to do it. Calling upon his aids, and appealing to a group of veterans for assistance, the struggle to clear the course began. With rushes marked by frequent hand-to-hand fights, the crowd was forced back and to the side until a semblance of a pathway was made, through which the cars might reach the starting line.

A. R. Pardington, the referee, announced to the press that the distance had been cut to eight laps, and that there would be a ten-minute control through Mt. Kisco for a stretch of 2.8 miles. No official measurement of the course was given out. Odometer reports had placed the length of the circuit between 32 and 33 miles, so by common consent 30 miles of racing road was accepted by all hands and the elapsed times announced were net on this basis. In a word, the eight 2.8 miles controls were eliminated in the timing. Each car was equipped with a box into which the control cards were dropped, following the method employed at the controls in the first Vanderbilt Cup race. Oldfield, by the way, lost his card-box during the progress of the race. McMurtry saved the cards.

At 6 o'clock the roadway was at least passable, though by no means clear. The official grandstand with its 3,500 seats and 240 boxes was a little more than half filled. The bank beneath the grandstand was crowded, shutting off the view of the finish stretch from the grandstand. In fact, the grandstand folks had but a meager peep for their money. A quarter of a mile below the course curved sharply and was followed by a hundred-yards climb up quite a perceptible grade. Then the racers almost immediately disappeared over the top of a hill beyond the start. The conditions at the stand were bad, and apparently nothing was known of how matters stood at other parts of the course. It was a gamble with fate, yet it was decided to cast the die, though "Wag" protested vigorously against the risk of a send-off being yet taken. At this moment two ambulances ominously drove up and took their stand by the roadside.

The First Lap.

The race was started at 5:07 o'clock, "Wag" counting Sartori away first and despatching the others at one minute intervals. All the drivers had friends to cheer them, but Barney Oldfield proved the prime favorite with the general public, though the fraternity seemed to take the most interest in Strang, Cedrino, and Vaughan. Bergdoll toed the scratch with no tool box, but on showing that he carried a full equipment of tools was allowed to start.

The first bulletin that Peter Prunty bawled through his megaphone was that Oldfield had passed Roberts at the railroad crossing. Roberts had started just a place ahead of Oldfield. There had been considerable side betting between the followers of the two, so this information was interesting. Vaughan got by Michener at Armonk, and Cedrino passed Sartori at Val-

Oldfield (Stearns) Overhauling Harding (Isotta).

Happy and Victorious Strang, Driving the Winning Isotta Across the Finish Line.

halla, and led the procession. About this time the crash of an axe against wood behind the stand attracted attention. The Pinkertons were raiding the shell game camp that the nimble fingered gentry had pitched.

All this time Wagner, Burchall, and the whole outfit were fighting with the crowd to clear the course for the return of the racers. The megaphone bulletins had told that the leaders were nearing the stand, apparently well bunched. All eyes were directed toward the sharp turn at the foot of the hill. In a minute a red car dashed around it and up the hill. This was at 5:49:42 or 42:42 from the start. It was the Savannah cup winner, Strang. In a single lap he had got by Lytle, passed Cedrino, and disposed of Sartori, making the round in 39:42. In 18 seconds Lytle shot by in second place. Just behind him came Sartori. The latter's Bianchi was plunging from side to side and stopped at the foot of the hill with a punctured tire. Cedrino and Leland completed the lap in order before Sartori had replaced his tire and got under way again.

Strang was out for a runaway race of it, such as had brought him victory at Savannah. Seymour had made a splendid run from the start with the Simplex and was actually second and but 14 seconds behind Strang. He had fought his way from

twenty-first in line at the start to the fourteenth place in the procession. Lytle was third in the race, and Poole fourth. Harding, the third Isotta man, had put on two new tires and replaced spark plugs, and yet had managed to climb from nineteenth to tenth place in the race.

The first and most serious accident in the race occurred in the first lap. Watson, by reckless driving, dashed into a telegraph pole at East View. He and his mechanic, Cotter, were thrown out, but only slightly injured. Watson pluckily set to work to mend the bent steering post and wheel, and in less than three hours had his car running again, so that he was timed for five laps in all.

Michener came to grief just where Sartori did, and lost 4 1-2 minutes putting on a tire at the foot of the home stretch hill. Harding in this lap made a three-minute tire replacement in front of the stand.

The Second Lap.

The order of the four leaders in passing the stand on the second lap was little changed: Strang, Lytle, Cedrino, and Leland. Cedrino actually had been passed by Vaughan and Murphy. The latter, by the way, was making a remarkably good race with the little Maja, the lowest-powered car in the race. In actual time, Strang led Seymour by about two minutes, with Vaughan third and Lytle fourth. Strang was rapidly pulling away from his pursuers, a trio of American cars. The home product was showing up splendidly against the foreign cars. Strang had covered the second lap in 39:18 net, his fastest in the race.

Word now came that the planks on the bridge across Murray's Creek were loose and dangerous. A carpenter was hurried to the spot with new beams.

Another interesting bulletin was to the effect that a cable from the London surety company had been received stating that the protesting Greenburg, which threatened to stop the race, had been included in the indemnity bond.

Robertson, from whom much had been expected with the mighty Panhard, had had tire troubles to burn and had fallen far toward the rear. "Monty" Roberts, too, was greatly disappointing his admirers. Oldfield, a sensation maker by profession, had a narrow escape from being wrecked by a train at

Start of Murphy, the Maja Candidate.

Picturesquely Situated, Unfortunately the Grandstand Did Not Supply a Most Extended View.

Kitchawan, the cow-catcher, so the story has it, actually lifting one of his rear wheels. Bernin's magneto came loose, and cost him a delay of 12 minutes before it could be readjusted.

The Third Lap.

Strang continued his daring runaway tactics and gained still another minute on Seymour in the third round. Vaughan and Lytle were having a hammer and tongs duel of it, and at this point the Stearns driver had a bit the better of the Jackrabbit. Minute intervals separated Seymour, Vaughan, and Lytle. Poole, who had a lot of troubles in the second lap with his spark plugs, just as he did at Savannah, got under way again with a vengeance and fought his way from tenth to seventh place. Oldfield was also going well with a lap in 41:15. In fact, the track champion was proving himself not a half bad road driver. Murphy was delayed by a blowout.

The Fourth Lap.

Seymour dropped back from his place as runnerup to lead in the next lap, letting Lytle and Vaughan into second and third positions respectively. The Simplex crack had been detained 13 minutes at Mt. Kisco, owing to the grease cup on his clutch having run dry. Strang, the leader, opened a gap of ten minutes on Vaughan, his nearest pursuer. The new American premier was going at wholesome speed, each of the four laps having been done under 40 minutes, a feat approached so far by but one of his rivals, Seymour, and that in only one lap. Barring accidents thus early he looked like an easy winner.

In this lap two cars were eliminated from the contest. Murphy, who had been making a fine showing with the Maja, having been at one time in fourth place, ditched his car and put it out of the running with a broken front wheel. Parker's Fiat ceased from strife with a cracked cylinder and a broken rocker arm.

This was the fastest lap for several of the racers: Harding, 41:48; Michener, 42:13, and Bloch, 45:29.

Oldfield's gas feed became clogged and his motor stopped. He had lost all his tools and was practically helpless. Finally the gasoline filtered through, the obstacle having been forced out. His loss of time at this juncture was very unfortunate.

The Fifth Lap.

Cedrino, the Cyclone pilot, now woke up and began the fast and well sustained run which finally landed him in second

place. The close of the fourth round had left the betting favorite in the race in fifth place. Having stopped to replenish fuel, he was prepared for a great effort. He certainly did make it, and make good with it, too, for he covered the 30-mile circuit in 39:35 and got by Poole, who had led him a couple of miles the preceding lap. He was now right on the heels of Lytle and Vaughan. The uncatchable Strang, however, was 12 minutes ahead of Lytle, his nearest pursuer.

Two more contestants went to the bad for good in this round. De Palma ditched the Allen-Kingston and hopelessly bent the front axle. Michener collided with a rock and bent the axle of the Lozier. In cranking the engine, it kicked and hurt his leg. This left 18 cars in the race fit for service and they all were running when the yellow flags stopped the race.

Mulford's mechanic in cranking the engine was actually kicked over and lay in the road senseless for some minutes.

The Sixth Lap.

A desperate hair-raising race was now on between Cedrino and Vaughan. In the duel between the two, Lytle was left behind and Strang's lead was considerably cut. The Italian put up a lap in 37:29. The blond New Yorker responded with a circuit in 36:51 and retained his second place by the narrow

Barney Oldfield, His Cigar, and Stearns Car.

margin of 15 seconds. Strang had slowed down to 40:24, yet still had over 11 minutes margin in case of accidents. Lytle, Poole, and Seymour were fourth, fifth, and sixth at one minute intervals. Sixteen minutes separated the first and sixth men of the leading sextette.

The Seventh Lap.

Strang without doubt now had the race well in hand, but not so surely that he could let up from the fast gait he had set and maintained from the start. Behind him Cedrino was driving like a wild man and eating up the intervening space with every bound. Faster and faster flew the Fiat. It had gone very fast in the fifth round, faster still in the sixth, and in the seventh there was still another kink of speed for Cedrino to let out. It was one of the most remarkable pursuits and gamest stern chases in the whole history of automobile racing. The Italian scored 37:16 for the seventh round, an average of about 48 miles an hour, a marvelous gait over such a course. He cut

The crowd was now uncontrollable and swarmed the course. Though it had been announced at the close of the seventh lap that eight cars would be permitted to finish, Chairman Morrell, seeing danger imminent, told the telephone men to 'phone for the hanging out of the yellow flags. Despite the crowd on the course Seymour managed to cross the line with the Simplex within three or four minutes, closely followed by Leland. Had they been officially timed, both would have beaten Sartori, who would have been thus put back into seventh place, as it started twenty minutes ahead of the Simplex and four minutes before the Stearns.

The final round brought quite a harvest of mishaps to the racers. Lytle had a blowout and two spark plugs blew out, all within four miles. Vaughan and Leland both had blowouts, the former one and the latter two. Seymour broke the hose connection to his radiator and was also held up five minutes by a train between the Apperson and Simplex camps. Leland ran out of gasoline, borrowed some from a Winton touring car

Renault, Bloch Driving, Enjoying One of the Best Stretches of the Entire Course, Where the Highest Speed Was Possible.

down Strang's lead from 11 to 10 minutes, though the Isotta crack had been going some himself with a lap in 38:43. Vaughan, Lytle, and Seymour were at Cedrino's heels as long distance racing goes and having a glorious triangular duel among themselves, Vaughan a minute and a half, Lytle three minutes, and Seymour six minutes behind the Italian, intervals that might easily be altered by a spurt or a slight accident.

Michener lost a tire. This made three punctures in all, each one occurring when he was far from any tire control.

The Finish.

The megaphone bulletins of the passing of the cars at the various points now became intensely interesting, and, in fact, vital. Reports from Mt. Kisco, Armonk, and Valhalla, told of the passing of Strang and Cedrino in order. Then came the final word from East View and the homestretch had been reached. Five minutes of excited suspense, and the red Isotta swung around the last corner with a mighty skid and thundered up the hill to the finish line, winner of the race in 5 hrs. 14 min. 13 1-5 sec. Cedrino's Fiat was second in 5:21:05 3-5. Vaughan (Stearns) was third in 5:28:29 2-5. Lytle (Apperson) was fourth in 5:39:15 2-5. Sartori (Bianchi) was fifth in 5:53:45 3-5.

and put it into the tank with beer bottles. Michener was stopped by a puncture while on his seventh lap.

HOW WINNING DRIVERS WERE REWARDED.

There is always a vast deal of glory for both car and man in crossing the tape victorious in a big automobile road race, but this is not the most substantial reward that the drivers of the first cars receive by any means. For instance, Strang received a bonus of \$1,000 from his employer, J. H. Tyson, \$500 from the Michelin Tire Company, \$100 from the Hess-Bright Manufacturing Company, and \$100 from Lavalette & Company, his winning Isotta having been equipped with Michelin tires, Hess-Bright ball-bearings and the Eisemann magneto. Another prize, previously announced as \$100, was raised to \$200, by the Hartford Suspension Company, the winning car having been equipped with its shock absorbers.

Cedrino, having taken second honors, received a prize of \$250 for bringing Continental tires over the tape in the next to best place, while Vaughan, in the Stearns, received a prize of \$125 for having gained third. In addition to the \$500 given to Strang for having brought Michelin's in first, the Michelin Company also gave \$500 to the entrants of the car, the Isotta company.

ACCORDING to A. L. A. M. rating, Strang's Isotta was the highest powered machine on the course, its cylinder diameter of 145 mm. being equivalent to 5.7087 inches, which by the formula gives 55.1 horsepower. Cadrino's Fiat that carried off second honors was much lower powered, showing but 48.4 horsepower; Vaughan's Stearns is rated at 46.2; Lytle's Apperson ties with the Fiat at 48.2; Seymour's Simplex, the non-official fifth, with its 53-4-inch bore, gives 52.9 horsepower; Leland with his Stearns, the non-official sixth, is 46.2, the same as Vaughan's; and Sartori's Bianchi, the non-official seventh, but official fifth, is but 41.6, the cylinder bore measuring 130 mm., which translates to 5.1182 inches. These were the only seven cars to reach the grand stand on the eighth lap and have their times recorded, the Simplex and Leland's Stearns being vouched for by three press representatives. Leaving the human factor out of the race then, the proper car won, assuming the mechanical construction of all of them to be on a par, which, of course, is far from the actual status of these seven machines.

That the highest-powered car should win, was not unexpected in the Briarcliff, due to the intoxicating meandering of the course through mountain valleys, by woodland stream, through forests, and by lakes, providing, of course, the car was geared for the test. Here is where some of the makers—and they were not a few—made a grave error; speed was the sole object sought, and, of course, high gearing was looked upon to provide this. But in this calculation the problem of having to slow down 87 times on each circuit because of bridges, corners, curves, or railroad crossing, besides added lowering of speed due to other cars on the course, was neglected, and this alone was responsible for a part of the story. Approximately 90 slow-downs on each circuit makes 720 on the eight laps, and whenever there was a slow-down there had to be a picking-up, and in these 720 pick-ups the mediumly geared cars had a great advantage. This was particularly noticeable at some of the grandstand curves. Once on the short straightaway stretch leading past the grandstand, Strang would throw into high and be away in a twinkling, whereas not a few of the others were slow and lost time on changing gears. In a course with 50 per cent. of straightaway, high gearing is good, but not so where 720 curves or turns have to be made. This happy combination of high power and medium gearing, coupled with the dexterity of Strang as a racing car pilot, and the good construction and design of the Isotta was the cause of the victory.

Wheelbase.—Next of importance in racing cars over a course of Briarcliff nature is the abbreviated wheelbase, which was lacking on most of the twenty-two competing cars, the Apperson, Hol-Tan, Shawmut, and Fiat being the only ones between the 100 and 110-inch marks. Strang drove a 118-inch machine, Vaughan's Stearns is 120 inches, the Loziers are reported at 124 inches, the two Simplexes have the same measurement, the Bianchi is 120, and the two Renaults and the Thomas are catalogued at 112 inches. The exact length of the Fiat wheelbase

is not known, but it is short, and this was in part responsible for a few of the fast laps Cadrino made. In making the grandstand curve Strang never accomplished it nearly so fast as Cadrino did on his last four laps; Lytle took it fast without apparent skidding; whereas Seymour with his long wheelbase Simplex threw up more dirt at less speed. Poole in his Isotta is a fast corner driver, duplicating not a few of his performances of the Savannah course, but throwing up clouds of loose earth on the poorer turns.

But the abbreviated wheelbase did not play as big a part on the 600 or more turns each driver who completed the eight laps had to make as might be expected, due to the peculiar grouping of the turns, it being rare except at right-angled turns for one to be alone. In places three or four follow in succession, the driver having to zigzag the course for a half mile at a stretch. On such places fast speed is not possible with any length of wheelbase; but it would have been interesting if a car of 96-inch wheelbase, much like the winning Darracq in the last Vanderbilt race, had been in the contest.

Tires.—After having noted a few of the primary considerations on racing cars, the majority of the spectators, for some unknown reason, look into the tire situation, and not a few of them believing that tire size, as well as construction, is a determining factor in a contest. With the exception of the Renaults, all of the foreign machines used one size of tires on the front wheels and a larger size on rear; Strang's Isotta used 870 by 90 mm. or 34.25 by 3.54-inch ones on the front wheels and 880 by 120 mm. or 34.64 by 4.72-inch pneumatics on rear. Cadrino's Fiat used the same sizes. It is not known the exact sizes used on the Stearns machines; Lytle used 34 by 3 1-2 and 4-inch front and rear; Sartori was an apparent believer in big tires, his Bianchi carrying fronts measuring 35.82 by 3.54 inches and the rears 36.02 by 4.13 inches. But it remained for the Simplexes and the Panhard to take the biggest sizes, these cars using 36.8 by 5.31-inch ones on rear. The Simplex used a 36.02-inch size in front, but the Panhard preferred a smaller size. The Loziers used 36 by 4 and 4 1-2-inch sizes in front and rear; 34 by 4 and 4 1-2 sizes were carried by Roberts on his Thomas; the Shawmut carried 3 and 36-inch makes; and the Allen-Kingston and Maja used small sizes. Practically all of the cars started off with studded-treaded pneumatics on the rear wheels and plain treads on the fronts; but it was noticeable how many put the studded treads on the fronts when a change was necessary.

It rarely happens in a race in this country that grandstand spectators have a glimpse of tire repair work, but two good views were had of this right at the starting and finishing points. On his first lap Sartori blew out on the grandstand turn, and a little later Poole changed at the same point. Both were good examples of the value of the demountable rim, the time required in one case being less than three minutes and in the other a little over four minutes. That Strang should make the

Bloch (Renault) Approaching Grandstand.

240 miles without a change of Michclins, incidentally duplicating his Savannah performance, is a point of great interest, and seems to prove that it is not so much the taking of corners as continuous high-speed traveling that works havoc with tires. While there were times in the Briarcliff that the cars were touching 80 miles per hour or more, these periods were exceptionally brief, and the tire temperature was apparently kept lower because of this. Those drivers who had tire trouble had it because of too fast corner work, due to hitting the corner at too high speed, using the brake too severely and then skidding badly on the turn. Parts of the course were very hard on tires, due to the loose stones; but, offsetting these spots, was the 10-minute control in Mt. Kisco which gave the tires an excellent opportunity each lap for dropping a few degrees in temperature. The steel studded tire proved a good servant for the many turns, as well as the multitudinous braking work.

Brakes.—One entrant after the race declared that to-day it is harder to make a good brake than a good motor, and the worn condition of a few of the brakes proved the quantity of truth the assertion contains. The last few Glidden tours have impressed very emphatically on many makers the efficacy of ample braking surface; in fact, tours impress this more than road racing. But the Briarcliff was an ideal jousting ground for friction brakes. All of the chain-driven cars with the exception of the Panhard used four brakes, the preferred location being two contracting band ones on the jackshaft and two expanding or contracting members on the rear wheels. Strang employs the cast iron against steel variety having two located on the jackshaft and two on the rear wheels. On the Fiat four metal brakes are positioned, two on the transmission and two on the rear wheels; on the three Stearns cars are steel against brass brakes, two on the jackshaft, two on the driving wheels; on the Apperson arc four on the back wheels, the expanding set steel against bronze; the four on the Simplex machine are two copper-lined ones on the differential shaft and two cast iron against steel rear wheel brakes. Many of the shaft-driven machines use hut three brakes, two on the rear wheels and one on the drive shaft or transmission shaft. It was a commendable point to notice how little slipping of the whcels was done in making the turns, the old-time story of "slipping the wheels and skidding around the corner" not having many followers. Such "slipping and skidding" makes a few seconds only to be lost in minutes by changing tires.

Ignition.—In ignition the magneto has the entire field; the winning Isotta used an Eiscmann high-tension magneto such as is familiar to many American car owners; a similar machine was employed on the Panhard, and in practically all of the remaining twenty machines Bosch magnetos of the high or low-tension variety were used. Double sets of spark plugs are quite common, but even two sets were not sufficient for many of the machines, and plenty of spark plug trouble was experienced. With Poole the porcelains gave trouble, as they did in Savannah, and Lytle's last lap was 10 minutes longer than his previous

ones because of these little parts. A portion of the trouble seems to be not in the fouling of the points, but in the fusing of them, due to the amperage and voltage. Plugs removed were perfectly clean, but the two sparking points united by a metal bridge.

Clutches.—The majority of cars used the multiple disk clutch, the followers of cone clutches being limited to the two Renaults; the Apperson was the only band clutch; the Stearns the only expanding type; the Maja the only coil spring Mercedes type; the Thomas the only three-disk variety, and the rest including Isotta, Fiat, Bianchi, Simplex, Lozier, Allen-Kingston, Panhard, and Shawmut used the multiple disk variety, the number ranging from fifty-one bronze and steel disks in the Isottas to smaller numbers in some of the others. The Shawmut employed the well known Hele-Shaw type containing fifty-one disks each having corrugations to increase the friction surface without excessive diameter as well as to facilitate disengagement.

Speeds.—In change speed sets, the selective type is paramount, the Panhard being about the only adherent of the progressive variety. The three Isottas were the only cars having but three forward speeds; all of the others using four.

Car	H.P.	Bore	Stroke	Car	H.P.	Bore	Stroke
Isottas	55.1	5.7087	4.7245	Renault	44.1	5 1-4	5 3-4
Flat	48.4	5.5110	5.1182	Thomas	52.9	5 3-4	5 1-2
Stearns	46.2	5 3-8	5 7-8	Allen-King'n	40	5	5 3-4
Appers'n	48.4	5 1-2	5	Panhard		5 45-64	5 5-16
Bianchi	41.6	5.1182	5.9056	Maja	30	4.3308	5.1182
Simplex	52.9	5 3-4	5 3-4	Shawm't	36.8	4.8	5 1-2
Lozier	44.1	5 1-4	5 1-4				

Motors.—Practically all of the motors excepting Apperson, Thomas, and Panhard, use cylinders cast in pairs, some employing valves on one side and others on opposite sides. The "T"-head cylinder is employed in the Apperson, Thomas, and Panhard. Where cylinders are in pairs the desire to obtain large valves has led to placing the valves oppositely, as in the case of the Isottas that employ 2 1-2-inch valves; but the Stearns cars have them on one side. Positive pump and fan circulation is in use on all excepting the Renaults, in which thermo syphon circulation is employed, and in which cars the radiators are carried at the rear of the motor, forming the dash.

Lubrication.—The trouble with the majority of motors on long races appears to be the lubrication problem, and it is surprising the amount of oil injected into them, especially those of the high-speed variety. Over 40 gallons were used on the 240 miles by three of the contestants, two of the others said over 30 was used by each of them, and those not questioned doubtless have similar tales of big oil consumption. When many of the cars passed they were lost in a cloud of smoke, which was such as to fill the road from side to side; on the other hand not a few cars made the seven or eight laps without ever emitting a bit of smoke, and it would be interesting if it were only known how much oil they used. As it is, the oil consumption of a car in a big race is not comparable to the consumption of such a car on touring work, and the prospective buyer need not get frightened at this favorable Standard Oil showing of some of the fastest machines.

Michener (Lozier) at Mt. Kisco Control.

Being Escorted Through Mt. Kisco Control.

Stock Cars?—As to stock cars, the less said in some cases the better. There were stock cars in the race, not a few of them, and they were immediately recognized by the spectators. But, on the other hand, there were cars of which ten duplicates have not been built as yet by the factories. There is not a doubt but that ten of the Isottas have been built and sold; in fact, there is good proof that many more than that number have left the factory; there is some doubt as to the manufacture of ten duplicates of Cedrino's Fiat, which proved to be the fastest

car on the course; the Appersons are known to have built more than ten of their "Jackrabbits"; questions have been raised as to whether ten of the Loziers were finished by the time limit set; but with the Stearns, Thomas, Allen-Kingston, Shawmut, Maja, Renault, Simplex, and Bianchi not a word was said. They are stock machines and look it.

The Mt. Kisco Control.—The ten minute control at Mt. Kisco puzzled a great many. Here the racers were met by men on motorcycles and escorted through the control at a regulated

Note.—Although the officials announced just prior to the end of the race that eight cars would be allowed to finish, owing to the manner in which the spectators crowded on the course, the word for the yellow flag was given when only five had come in. Despite the people on the course, Seymour, in the Simplex, No. 21, crossed the line within three or four minutes, closely followed by Leland in the Stearns, No. 5, both thus beating the Bianchi, which should really be placed seventh, instead of fifth, as it started 20 minutes before the Simplex and 4 minutes before the Stearns.

*Overturned on first lap, putting steering gear out of commission.

speed of 20 miles per hour. Some complaint was made by the deputy sheriffs that a great many of the drivers exceeded this speed, in spite of the fact that no matter how fast they made the control they had to stay there for ten minutes. This was remedied, and the officials of the law were satisfied.

An Old-fashioned Lady.—One of the curiosities of the race was an old-fashioned lady who owned nearly an eighth of a mile of haying ground alongside the course, just below the grandstand. She refused all offers from speculators to rent her property for the day for a grandstand.

Bernin and Renault Passing Tire Control Where He Didn't Stop.

LITTLE things play a very large part in automobile road racing, and the omnipresent hand of Dame Fortune—luck for short—may make or mar the chances of any one of the aspirants a dozen times in a single round. What an all-powerful factor luck in little things is, where success in road racing is concerned, has been strikingly proven time and again on the smooth stretches of the Long Island course, with its magnificent straightaway stretches. How very much more so must it prove on the tortuous, 30-mile circuit of the crumpled-up paper type, with its impossible bends and turns, each one with its pitfall of narrow, creaky bridge, or its menacing stone wall, and with scarcely a quarter mile straight, or a half dozen places where a competitor could safely be passed at speed? This was the general consensus of opinion of the race-seasoned spectators and the devotees of the pencil and camera gathered at the stand at Briarcliff last Friday, patiently waiting for the time when the raucous barking of the hot frankfurter man would be drowned by the exhaust of the racing cars as they came to the line to be sent off to—who knows what? Conjectures were of every shade of pessimism.

Accustomed to seeing quite a substantial percentage of the competitors eliminated for once and all, before completing one lap of a good course, what would happen to the driver on this indescribable conglomeration of hills, twists and turns on which the slightest indiscretion meant disaster, was a matter of endless speculation. The little things counted, to be sure—they must always be reckoned with, but there were so few of them, and they were of such a commonplace nature in the main that precedent may be said to have been effectively overthrown. Never before have so many cars been running in full blast when the starter's checked flag has fallen over the last car to cross the line and the impatient spectators along the course have made further continuance of the race unsafe by crowding out into the road, as they did on Friday last in true Vanderbilt race style, once the

flag had dropped on the fifth car.

While the inevitable happened, in that most of the delays were due to tire trouble, and, as must always be the case, they formed the bulk of the causes that made for delay, still they were very far from amounting to what had naturally been anticipated of the course, or what was to have been expected in view of the terrific strains that it imposed. Vaughan, in the 60-horsepower Stearns, carrying "No. 8," which was the first American car to cross the line, might well have been moved up a place or two in the finishing order, had it not been for the loss of two tires. Study of his performance by laps shows that they cost him close to ten minutes, and as they formed a great source of delay, it is safe to say that Vaughan would have brought the Stearns over the tape in a much better position had it not been for their retarding influence. The rear left tire gave way near Wampus Lake on the third round, so that instead of bettering his time for

the lap by two minutes, as was the case on the second round, it took seven minutes more than the first time over course.

By the sixth round, Vaughan had been steadily making his pace better and had succeeded in getting well below the 50-minute mark. He passed the stand on the final going at a good pace, but had hardly cleared the brow of the hill above the grandstand when the front left tire blew out. Quick work was done in replacing this, the total loss being about four minutes, as shown by a comparison of the lap performances. Lytle's delay in the Apperson insured Vaughan third place, but without the delays incident to tire troubles, he would easily have made second, as is shown by the fact that Ccdrino was but seven minutes ahead at the finish, in spite of the Italian's daredevil driving on the last three laps, which were the fastest of the race, all being under the 40-minute mark.

How the Little Things Lost Places.

It is certainly bad enough to have to reflect that nothing more than a mishap of the most trivial nature was responsible for

Bergdoll, the Benz Contestant, Rounding One of the Many Turns.

delay which brought lost honors in its train, but how very much more so is it when, after having completed all but a few miles of the distance, one of those petty little details that is not even considered an inconveniencce at other times, crops up to spoil good chances of crossing the line among the first three. Such was the lot of Lytle in the Apperson. The little Apperson had been reeling off the miles like a watch—nothing phenomenal in the way of speed, but demonstrating by every lap that it was displaying in the most striking manner those very qualities which the race was designed to bring out. Lap after lap, it passed the stand with its times for the rounds but a few seconds apart, while the fifth and sixth laps were covered in identically the same time to a second, Lytle taking 40:36 in each case to cover the thirty miles, while the first and second laps were but 13 seconds apart.

Lytle started third and ran so regularly that the Apperson was generally believed to have third at the finish pretty heavily mortgaged, as the Apperson had a clear lead of several min-

enough time to prevent him from scoring well, through one of those petty little things that is all the more exasperating owing to its very simplicity. The grease cup on the clutch collar of the simplex ran dry and the clutch heated so that it could not be disengaged. This cost Seymour 13 minutes on the fourth lap. But even at that, he might still have scored had not further and equally simple and aggravating mishaps caused more time to be spent in fussing instead of covering the distance at the good clip which the Simplex maintained throughout the race. Nearing the latter half of the last lap, the piece of hosepipe connecting the radiator and the pipe on the motor loosened and let the water escape. This was quickly made good, but Seymour then found himself on the wrong side of a railroad train at the crossing about half way between the Apperson and Simplex camps. Trains moved so rapidly on race day that this little coincidence cost another five minutes—just enough to prevent coming in fifth—that is, officially, as in spite of these handicaps his running time taken unofficially entitled him to that position.

One of the Exciting Incidents of the Race—This Scene is Along the Shores of the New Croton Reservoir.

utes over Vaughan's Stearns at the opening of the last lap. But the little things had not been reckoned with. Lytle's Diamond tires, which had borne up under the terrific strain without a sign of weakening up to the time, stood the racket until the last half of the last lap, when the right rear gave up the ghost between Armonk and Valhalla. The Apperson crew certainly had no cause for complaint on the score of tires, but what little trouble did fall to their lot came at a most inopportune moment.

But Lytle still had a comfortable hold on third, even after replacing the damaged tire, and would have had no difficulty in getting home in that position with a good margin if the same evil genius had not continued to pursue him. Immediately after replacing the tire the engine began to sputter and an examination showed that the ignition current from the magneto had been too hot for the points of a spark plug. The process had to be repeated twice, three plugs being replaced, in addition to the tire, all within three or four miles on the last lap.

It is not to be inferred that tires alone were the cause of some of the competitors, whose chances for places among the first five seemed excellent in the early part of the race, after falling behind. Seymour, whose driving of the 50-horsepower Simplex, carrying "No. 21," aroused great admiration, lost more than

Although it was true that tire troubles alone were not responsible for the delay, some of the drivers had far more than their share, as witness the experience of Michener and Mulford of the Loziers, Nos. 7 and 9. Thus Michener had to replace three tires and Mulford had to make four good, in addition to a later mishap to his mechanic which put him so far behind that it was useless to continue. Michener was unfortunate in having to replace every one of his damaged tires far from any of the outside assistance that the rules permitted where tires were concerned. On the first lap, a rear went bad right near the stand, costing six minutes. Later he ran two miles on a flat tire, then through the control at Mt. Kisco, this being on the sixth lap, while on the seventh he lost another. A loose cotter pin in the clutch pedal connection also cost him two minutes.

Mulford probably had more tire trouble than any other two drivers put together, as he had to replace a tire in each one of the four rounds that he made. On the fifth round Mulford's mechanic must have neglected to retard the spark, as he was rewarded with a back kick that threw him several feet into the air. Landing on his head on the road he was knocked unconscious. Mulford had to await the arrival of the ambulance and much time was lost.

In view of the unprecedented nature of the course on which

Bernin (Renault).

Mulford (Lozler).

Seymour (Simplex).

they had to compete, many of the drivers figured out a schedule for themselves and stuck to it religiously, despite the temptation to speed a bit when it became evident that schedules did not win races, though they were striking evidence of regularity and reliability. Bernin and Bloch, in the two Renault cars, were good examples of this, the former losing 12 minutes on the second lap through a loose magneto, which sums up the entire troubles of both of the Frenchmen. They suffered no other delays either from their Michelin tires or mechanical causes, plugging their way round steadily at a good average pace.

The little Hol-Tan-Shawmut handled by Hilliard, which was only put in three days prior to the race, after having come over the road from Boston in record time, was another "scheduler" that showed surprising regularity of performance, not to mention lap times, that, in many instances, bettered those of their far more powerful competitors by several minutes. Considering the very short time that had been allowed for getting the car in shape, as its only running-in, outside of the usual factory test, consisted of three days on a stand in a garage, and the fact that Hilliard had hardly an opportunity to practice, much credit is due the car as well as the skillful manner in which it was handled. Its only stop was to replenish the gasoline tank, taking 1 1-2 minutes, while it averaged 46 1-2 minutes to the lap, the slowest being 49 minutes.

Stearns Cars Suffered Odd Handicaps.

Oldfield in the Stearns with the "No. 13" "hoodoo," found his bad luck in the fourth lap. During the bouncing and swinging round curves, his tool box had flung open and lost practically its entire contents, so that while on Valhalla hill, just after having passed the Bianchi, a stoppage of the motor placed him in a peculiar dilemma. It proved to be an obstruction in the gasoline feed line from the tank, but there was nothing to remedy it with. A few minutes' wait sufficed to allow enough gasoline to filter through to run a mile or so, and then there was another wait. This was repeated three times until the Stearns camp was reached, when the aid of a pair of pliers served to make things good. In the fourth or fifth lap, no less than three tires went flat, one of them while passing through the Mt. Kisco control.

Leland's delay in the "No. 5" Stearns was also "gasoline trouble." On the last lap he was stranded far from any supply

depot without any more "gas." The owner of a Winton touring car volunteered a replenishment, but the only means of transfer consisted of empty beer bottles so that the process was not a rapid one. Fourteen minutes were lost in this manner, in addition to which Leland also suffered one puncture in the fourth lap, which cost him five minutes, and two blowouts in the fifth lap just before arriving at the Mt. Kisco control and wasting another five minutes each, so that his delays totaled practically half an hour. After the race was over Vaughan found that he had also had gasoline trouble, the fuel leaking away from the auxiliary tank about as fast as it was being used from the main tank. Figuring the delay that this cost him, together with the others already chronicled, it will be seen that the "No. 8" Stearns was the most dangerous competitor that Strang had.

Maja's Trouble Dated Before Race.

Murphy, driving the sporty-looking little Maja, "No. 10," was certainly the victim of circumstances over which he had less control than did his competitors who suffered from delays caused by trouble occurring during the course of the race. His mishap originated some time before the race, and was due to the manner in which the wheels of his car were rebuilt by a local maker in putting the dismountable rim attachments on them. According to Murphy, who attracted universal admiration on the backstretches by the skill with which he handled the little car on the curves, the wheel was rebuilt with a fellow of several pieces of soft wood, instead of two sections of hard wood bent into form. Coming round the curve at Hawthorne corner, the wheel simply collapsed, the spokes being so loose that they pulled right out.

There was a prevailing general impression that Strang and his Isotta went through without a single stop, but this was not the case, as even the winner had troubles, too. On the sixth lap a stop had to be made at the Mt. Kisco control to replenish the gasoline supply, while in the very first lap a pin sheared off on the rocker arm of the change speed gear, preventing the shifting lever from being passed through the opening in the sector, so that only the third and fourth speeds were available after that. This made it a difficult matter to start the car, as it was necessary to race the motor every time to prevent stalling it, and all the bad places, particularly Valhalla hill and its turn, had to be taken on the third.

Murphy (Maja) Overhauling a Rival.

Where Pennsylvania Tires Were Supplied.

How They Saw the Race.—Long before nightfall of the day before the race the metropolitan automobiling fraternity began to make the history of the Briarcliff Trophy contest. A few hours later the general public added the factor of its racing enthusiasm and eagerness to be literally "in at the death," which the conditions seemed reasonably to promise. It was daylight on Friday, of course, before the cars and drivers were to furnish the struggle that had drawn these many many thousands to view the battle of steel, muscle and nerve that had been framed up and the tragic incidents that seemed assuredly imminent. Twenty-two American daredevils were to be recklessly cut loose over a narrow course with almost continuous sharp curves, bounded by dangerous ditches, stone walls, rivers and ponds the whole way, and replete with axle and spring racking and tire wrenching stretches, beside to risk limb and life in the wild scramble. The Briarcliff district is neither as familiar nor as accessible as the Nassau county circuit.

Thursday afternoon cars began to stream out Broadway and through the Hudson river towns. With nightfall their numbers increased, and by midnight there was an unbroken procession of gleaming headlights hurrying courseward. The hour for the closing of the course was an enigma. There had been official pronouncements that the entrance to the circuit would be barred between 2 and 3 o'clock, so that the majority cared not to risk missing securing a viewpoint by a past midnight start. As early as 1:45 A. M., a squad of pressmen set out for Tarrytown, where they had been put up for the half-night at the Maxwell-Briscoe factory. The road was then aglow with gleaming searchlights. Turning to the east streams of foot passengers lined the road. The course reached at East View, the midnight scene was one full of fire and life. Stands, large and small, had been erected along the roadside. On every furlong of the road to the start there were parking space speculators swinging their lanterns and hawking their spaces. In places there were bunches of a dozen or a score of cars parked in the skirting fields. Here and there at frequent intervals an isolated vantage point had been squatted upon, and one saw the camp fire of the all-nighters.

Approaching the grand and press stands at Briarcliff, the crowd of cars and people became denser, ending in a hopeless jam of machines and men at the start and finish point. En route were passed sky-larking processions of young men with arm badges telling that they were marshals. It is said that they were the much-boasted militiamen who were to guard the course. To one who had seen the businesslike soldiers at Savannah, it seemed a huge joke to call this military protection.

With the coming of daylight, the throngs of foot passengers from the incoming trains and the nearby towns increased. With rare common sense they climbed the encircling hills and avoided for the most part courting danger by standing along the edge of the road. There were crowds, of course, at the turns, and here the hired guards and volunteer marshals were concentrated, and made a show of keeping the crowds back and in order. The newspaper men en route noted that several of the makers had established parking camps for their customers. There were

parking grounds prepared by the Peerless and the American Locomotive people, and the Maxwell-Briscoe Company had pitched a veritable Maxwell camp on a commanding hill.

"No. 13" Almost a Hoodoo for Barney.—Barney Oldfield did not quite get away with his hoodoo number, for Stearns car "No. 13" very nearly justified the universal feeling about the number in the very first lap of the race. It was just 5:30 o'clock in the cold gray dawn of the morning when Barney narrowly escaped being thrown into kingdomcome by the special train from New York on the Putnam division at the State road crossing, half a mile from Kitchawan. A special from New York, consisting of an engine, tender and seven cars, whistled for the crossing and bore down upon it. Just as the whistle sounded, the spectators were horrified to see a racing machine bearing the fateful "13" come tearing along at a speed of over 50 miles an hour and loom up through the fog from around the curve which hid the track from view. The flagman made a jump for the track and wildly waved to the engineer to stop. The train itself was bowling along at a good trip, and, in spite of the fact that the engineer promptly clamped on his airbrakes and reversed, the train slid along the track until the cowcatcher stood half way over the crossing. There were just two things for Barney to do. He had either to swerve and go over the rails below the crossing, thereby courting instant mishap, or take a chance and skim by the cowcatcher as it protruded across the right-of-way. In a second's thought he chose the latter, and those present were treated to a bit of daring and clever steering, for Barney, to make sure, put on more speed and went at it. The off-wheels of his big Stearns grazed the projecting cowcatcher as he went by, and it tilted the machine until it assumed an angle of 45 degrees. All held their breath, but the minute the car left the cowcatcher it righted itself, and Barney was off, cigar still in mouth, while the engineer reversed his train farther up the track.

Confusion on the Grandstand.—Stories of the demoralization in the conduct of the grandstand are afloat. There would seem to have been neither head nor tail to the management of this important feature of the race. The ushers proved inexcusably incompetent in seating those who had bought tickets. Seat-holders boldly preempted boxes and refused to be dislodged, and no one appears to have been available for an appeal or redress. The wife and several women friends of one importer, who had several cars in the race, were practically fired out of his boxes back into the seats by a party of male and female roysterers of the "Tenderloin" type, who showed corresponding number reserved seat coupons and insisted that they entitled them to the box. A bearded usher, who was summoned by the importer, accepted the addition of another drink to his ample cargo, and was quickly won over to the side of the intruders. Even when the importer left his 'phone to seek relief, he could find no one in authority from whom he could get satisfaction, and had to submit to his wife and her guests being driven from their boxes.

Referee Pardington, Chairman Morrell, Starter Wagner, et al.

and filled up our tanks at our control, just outside of Mt. Kisco; this was the only stop we made while outside of the Mt. Kisco control.

A great deal of the credit of our victory belongs to Marquise, who sat in the mechanic's seat. Being naturally careful, he kept me from getting reckless at any time, and a good man with you is all your race.

From what I have seen of road racing I think that a driver should never be instructed to hold back, for a race starts right from the word "go," and time lost can never be regained. No race has been won from laying back, unless the leading cars broke down, and then it's only a gamble. So, to talk of going easy for half a race and then going out to make time, is too hard on the driver, for the others have already gotten a lead that may prove impossible to cut down.

My only regret is that I didn't have the wheel of an American car, and

I hope some day to pilot an American car to victory against the best that Europe can turn out. The E. R. Thomas Company is sending over a Grand Prix entry, and I know that all true Americans will wish me the greatest success, for I am going to drive it.

THOMAS SECURES STRANG FOR GRAND PRIX.

Louis Strang, who followed up his victory in the Savannah Cup race by winning the Briarcliff trophy, and thereby came pretty near preempting the top rung of the American racing ladder, is to represent this country in the Grand Prix. Harry S. Houpt, acting for the E. R. Thomas Motor Company, with characteristic hustle, has secured his services and those of his mechanic, J. B. Marquise, as crew of the Thomas Candidate for international honors in the great contest in France on July 8. Mr. Houpt will sail with Strang and Marquise on May 15, see to securing training quarters, and be their mentor and manager in the race and during the preliminary practice. The securing of Strang and Marquise was made possible through the generous

AFTER the drawing for starting positions had taken place, and I had looked over the order of the start, I decided that Cedrino of Fiat No. 2 was the man that I had to beat, and that if I didn't get him in the first couple of laps I would never win. So when Wagner gave the word "go," I started right out and drove every curve the limit, and got every bit of speed out of the car that there was in it. There was a fog bank that was very bad, and my perfect knowledge of the road undoubtedly gave me a great advantage over the other men ahead of me, who had to "feel" their way through the mist while I drove wide open, and knowing just where the corners were, was able to shut off, scoot around, then open up again, and rush onward. I caught Lytle and Sartori right after leaving Eastview. Cedrino had already passed these two. I passed Cedrino about twenty-five feet out of Pleasantville turn.

I drove very hard for possibly a couple of miles, and, after asking Marquise if everything was clear behind, I began taking it a little easier, and drove carefully from then on until the end of the race. We had a private telephone wire from the stand to a signal board at Eastview where I got my relative position and time during the entire race, so I knew just how hard I had to drive. Also at the Mt. Kisco control Mr. Moscovics, of the Allen-Kingston, very kindly showed me a score card on every lap and kept me posted as to all the news of the race.

I had no tire trouble at all, as I cut out all "grand stand" corner work, drove all corners easy and never skidded an inch at any time. My brakes were new, and the shoes wore down until they wouldn't hold, and Marquise got down on the floor boards, and, leaning under the car, tightened them up until they held perfectly. A strap which we had on the back of the car came loose, and threatened to run into the rear sprocket; Marquise climbed out of his seat over the gasoline tank to the end of the car and then back again, and we didn't have to stop even for that. We stopped on our sixth lap

Roberts (Thomas) Making One of the Picturesque Turns.

and sportsmanlike conduct of J. H. Tyson, with whose Isotta car they won both the Savannah and Westchester races, in granting them a leave of absence for the purpose.

Two Thomas cars will be sent over. Strang and Marquise will go to the E. R. Thomas Motor Company's factory at Buffalo to look them over before their shipment.

It is said that A. L. Riker had made advances to Strang with a view to getting him to pilot a Locomobile car, which he thought of entering under the double fee provisions of the rules as to late nominations. Whether Mr. Riker will persevere in his plan to have the Locomobile Company represented in the Grand Prix remains to be seen.

Strang Has Driven Many Makes of Cars.

The story of Louis Strang's automobile life discloses a wider familiarity and experience with motor cars than one would look for in one so young, for he is but twenty-three years old, having been born at Amsterdam, N. Y., August 14, 1884. He was educated there and later at a private school at Scarboro, near the Briarcliff course. His mother, who was a woman of considerable property, lost her money in Chicago gas stock and Louis had to go to work. Later his mother died, leaving three sisters for him to support, one of whom is now married. He started as a typewriter with H. H. Franklin, who was then a maker of them, and thus later became familiar with autos.

Strang became a chauffeur, in this city, first driving Franklin No. 4. He then went with H. P. Robbins, and toured Europe as his chauffeur, a Panhard having been purchased on the other side from Henry Farman, the racing man. On his return to this country, Strang demonstrated the French Berliet for Mendel, Dalc & Co., its American agents at that time. His next employer was H. O. Havemeyer, the "Sugar King," who leaned toward the Mercedes.

Strang got his first racing experience as demonstrator for Joseph Heller, an importer, through driving his Pipe car in

the straightaway races at Long Branch. He next went with E. C. Hoyt, president of the Leather Trust, and then returned to demonstrating under E. B. Gallaher, importer of the Richard Braier. Then he looked after a pair of Renaults for C. B. Hudson, a race track man, the intimate friend of John A. Drake.

Walter Christie next secured him for his mechanic in the elimination trials and Vanderbilt Cup race of 1906. Strang then looked after Robert Maxwell's Panhard.

Last year the Briarcliff Trophy winner was Christie's mechanic in the Grand Prix. On his return he went with the Pilain agency, driving one of its cars in the 24 hour race at Brighton Beach last season. After this he was chauffeur to E. C. Clark, the son of Bishop Potter's wife, whom he left to go with Christie in his Southern track racing tour. After Christie's accident, Strang drove the car.

John H. Tyson, the twenty-two year old sportsman, was his next and is his present employer. Strang was sent to Savannah to drive the Isotta Fraschini that Mr. Tyson had ordered direct from Italy. It was not on hand when he reached Savannah, so he studied the course in a touring car. How he won is history.

Strang's practice for the Briarcliff race consisted of six rounds of the course in a Franklin and one try-out lap in the Isotta he was to drive in the race. "I attribute the greater part of my success as a driver," said Strang, "to the instructions I received from Emil Stricker. Stricker came to this country when the Daimler Manufacturing Company bought the American rights to manufacture the Mercedes. Later he was a demonstrator for the late Alexander Fisher, who then imported the Rochet-Schneider. It was while he was with Mr. Fisher that he gave me the driving lessons I have always remembered and followed. He taught me how to turn curves, how to hold the steering wheel at the bottom, and above all not to touch any lever until I was ready to use it. Stricker has now an interest in the Porthos Company, in Germany. He drove a Porthos in the last Grand Prix, and now we will be fellow-competitors."

A BUDGET OF NEWS FROM THE FRENCH CAPITAL

By W. F. BRADLEY.

PARIS, April 25.—As the result of the run from Paris to Nice and return, a distance of 1,400 miles, the spring wheel competition has once more proved that automobiles are not entirely dependent on pneumatic tires, but the test has also brought to light the fact that all the systems put on the market are not suited for rough usage. There was practically nothing that was new in the third annual competition, the systems represented having all been shown to the public in the annual exhibitions at the Grand Palais.

The winner of the competition is Ducasble, which finished without any repairs, made the fastest average time and was in good trim at the end. It is a tire which has been on the market for some time, and was used on one of the French cars starting from New York on the run to Paris. In this case, however, the tires had to be changed for pneumatics before Cleveland was reached, and the car abandoned later. This particular substitute has been more fortunate in the French test, for three sets of tires finished at the head, and will probably get first positions when the committee has finished its examination. The Ducasble tire is composed of a series of small air chambers, each one of which is emptied of its air when put under pressure and filled by suction as soon as weight is removed.

Sider tires stood the test well, if one may judge by the condition of the bandages of the four cars equipped with this make. A Darracq and two Rebour runabouts, as well as an Alcyon runabout, finished the run without any trouble, and had their tires in excellent shape on arriving at Paris. This tire has all the earmarks of a pneumatic casing, but instead of being filled with an air chamber has a series of circular sheet steel springs with a layer of rubber between each and united by a chain. The method of mounting is the same as for a pneumatic tire. Instead of an inner tube, however, there are circular blocks of wood, which act as a wedge between the heels of the tire, keeping it fixed on the rim, and are themselves secured by bolts passing through the felloe. In the case of a very severe blow, it is not the rim but the block of wood in the place usually occupied by the air chamber which would receive the shock.

Masses of Springs Are Being Discarded by Wheel Makers.

Spring wheels of the type which were so much to the front a few years ago, obtaining their elasticity from a mass of springs, are very little seen now. A proof of this is obtained in this competition, where the three most successful makes have ordinary fixed spokes and some special type of rubber or spring bandage, or a combination of the two. One other make which may be put in this category is the M. Y. G., composed of heavy blocks of rubber perforated transversely. There are twelve blocks for a large wheel, each one being held by means of a bolt passing through the felloe. Two examples of this system were shown, one being on a heavy Delaunay-Belleville limousine with inside steering, and the other a large Peugeot touring car. The fastening of some of the blocks appeared to be somewhat defective, but otherwise the wheels on both cars were in good condition.

Among the double-rim type was the Metallo-Elastic, which obtained its elasticity from a series of rubber balls in a cage between the two surfaces. On a small car the system had acted very satisfactorily, one of the wheels dismantled for inspection being in excellent condition. On a heavier Darracq car, however, the friction had caused heating to such an extent that a leather band holding the balls together in a series had been burned through, and the balls themselves had begun to show serious signs of breakdown.

There were two types of pivoting spring spokes which managed to finish the run, but neither presented any very attractive features, being much too heavy for ordinary use and not suitable

for fast work. Of the nineteen cars which started from Paris, fourteen returned, but of these several had suffered penalization en route, the official finishers being but nine.

S. A. Miles Arrives in Paris, Pierce Arrow Route.

There is a genuine fear among automobile dealers, garage proprietors and hotel proprietors in Paris, and generally throughout France, that the number of American visitors this season will be smaller than usual, owing to the financial depression, which appears to have shocked Europe much more than America. The fear will probably be ill-founded, for automobilists from across the Atlantic are already arriving, though the season has hardly begun.

S. A. Miles, general manager of the N. A. A. M., arrived here recently on his 40-horsepower Pierce Great Arrow car. He is accompanied by Mrs. Miles, and had as a traveling companion from London to Paris Arthur Lumsden, manager of the Goodrich Tire Company's London house. After several days in Paris, made busy by visits to aeronautical and automobile factories, principal among them being the huge Renault establishment at Billancourt, where Szisz inquired eagerly after the prospects of another Vanderbilt race, Mr. and Mrs. Miles left for the Château district and the south of France. In a couple of months they will probably return North, pass through Paris, and make a brief run through England, before embarking for America.

Mr. Miles expressed his delight at the really practical manner in which the various associations in Europe made touring for foreign visitors an even simpler matter than it is in their own country. In this connection, Victor Breyer, the A. A. A. delegate in Paris, is now installed in his new offices, at 4 bis Rue Descombes, and reports a complete organization for members of the association who need touring information and assistance in Paris.

Secretary Lambert, of the St. Louis Aero Club, has been in Paris several weeks, accompanied by his wife, and has naturally spent much time at the French club's aero ground and at the flights of Delagrange, Farman and others in the neighborhood of Paris. Last week Secretary Lambert made an unaccompanied ascent in the *Cythere*, of 600 cubic meters capacity, rising from the Saint Cloud Park and descending at Limours.

French Makers and the Vanderbilt Cup Race.

French constructors appear to have just awakened to the fact that a Vanderbilt Cup race will be held this year, and, with the awakening, is a realization that the conditions are not what they would prefer. The large majority of builders ask why the international rules, adopted by the Ostend conference, are not adopted for the great American race. In view of the fact that the A. C. A. delegates were present at the conference and voted these rules, French automobilists are at a loss to understand why these international conditions have only been adopted in a very limited degree. It should be explained that the average Frenchman does not appreciate the shades of difference between the A. A. A. and the A. C. A., and argues that since America voted the rules, America ought to live up to them. No preparations whatever have been made for the race, the general impression being that the announced conditions are tentative, and that later the 155-millimeter rule will be adopted. It is doubtful, indeed, if any foreign representation can be obtained under any other conditions, for no factory in Europe intends to build more than one set of racers for the 1908 season. The desire is expressed in certain quarters that there be a progressive reduction of the entrance fee when two or three cars are entered by one firm. This has been done for the Grand Prix and the A. C. F. voiturette race this year, and these are considered to have established a precedent that should be followed in the Vanderbilt race.

"RUBBERNECK" WAGONS WANTED IN TEXAS.

Texas is nothing if not progressive, and the prevailing spirit is the same whether it happens to reside in one of the larger cities or in one of those places that it is difficult to locate on the map even with the aid of a microscope. Certain evidence of this is to be found in the fact that, after much investigation, "Searcher No. 12," of the New York post-office, wrote across a particular piece of mail matter, "Try 949 Broadway." The envelope in question bore the following (it would be a stretch of courtesy to call it an address):

Automobile co
The American Rubberneck,
New York.
care of W. E. Sebree
Originator

Only the words in the upper righthand corner and the direction of the postal searcher prevented the missive from being sent to that vast storehouse of unanswered correspondence, the "Dead Letter" office, and in that case the following gem would never have seen the light.

W. E. SEBREE:

Sir.—You will find enclosed a clipping from the "Woman's National Daily," a paper published in St. Louis, of which I am a subscriber, and seeing your "ad," write you. I am trying to find an automobile house that can put me up which I so much desire in this line for the people of this country. First, I want a car that will carry at least fourteen passengers and 1,000 pounds of baggage and travel over the hills, and pull the sand and mud. I have several men wanting machines for different purposes—two or three for stage lines—also they want a large and substantial auto, something to rely on in all constructions. Now I mean business. Send all your cuts, catalogues, and special prices to agents at once. Or send a man here at once to help me choose these sales they are anxiously awaiting some one who has the machine that can and they will not be afraid to demonstrate them. You and I can do a business here at once for ourselves to start the agency for Texas. Honorably yours for business.

B. W. HONEYCUT.

Brady, Texas.

The clipping referred to is headed "Rubbernecks for London," and reads as follows:

London, April 7.—The American rubberneck sightseeing automobile is to be given a chance in London. W. E. Sebree, originator of the rubberneck wagon in New York, is behind the plan to install them here. Three of the big cars, carrying 37 persons, in charge of megaphone instructors, will be installed. If they prove successful more cars will be installed and the innovation will then be tried in Paris and other European capitals.

TAKING CARS ACROSS THE BORDER.

Touring across the border in Canada will be facilitated by the conditions now prevailing. According to "The Official Automobile Blue Book," from which the following information is taken, automobiles may now be imported into Canada, duty free for three months, the importation to be reported on a prescribed form at the custom house at the point of entry, an examination and appraisal being made. An invoice showing the selling price of the car must be produced, a cash deposit of \$25 made, and a bond signed in double the amount of the estimated duty.

The principal points of entry are at Niagara Falls, Ont., reached by way of Buffalo, N. Y., and Windsor, Ont., across the river from Detroit, Mich. For these points the C. S. Warner Company, 31 Clifton avenue, Niagara Falls, Ont., will arrange all details including bond, registration, driving license and the like at a cost not exceeding \$10, and no cash deposit will be required. Quebec, P. Q., is another important point which may be reached via Rouses Point, N. Y., to Lacolle, Que., St. Albans, Vt., to St. Armand, Que., Malone, N. Y., to Athelstan, Que., Ogdensburg, N. Y., to Prescott, Que., Newport and Richford, Vt., to Mansonville, Que. and Lowellton, Me., to Beauce, Que.

New Brunswick may be reached by way of Vanceboro, Me., to McAdam Junction, N. B., or Houlton, Me., to Woodstock, N. B., while Nova Scotia, being practically surrounded by water, would generally be approached by the tourist on a steamer

and there are custom houses at all ports of entry. Tourists into Quebec who have not previously secured registration and driving permits may obtain them upon entry into the Province from the following customs, or provincial officials:

Athelstan Wm. Saunders, Sub-Collector.
Coatcook J. B. Daly, Collector.
Comins Mills W. C. Kingsbury, Sub-Collector.
Cookshire A. Ross, Collector.
Dundee John D. McMillan, Sub-Collector.
Frellghsburg J. H. Baker, Sub-Collector.
Hereford Austin Hunt, Preventive Officer.
Lacolle J. A. Paquet, Sub-Collector.
Lake Megantic A. B. Gendreau, Sub-Collector.
Mansonville Station H. A. Gilman, Preventive Officer.
Noyan Junction W. M. Jameson, Preventive Officer.
Phillipsburg P. E. Luke, Sub-Collector.
St. Armand E. A. Bourret, Collector.
Stanstead Junction C. F. Bellam, Sub-Collector.

Collectors of Provisional Revenues.

Quebec J. E. Fortier.
Montreal S. P. Leet.
Sherbrooke Morkill & Lefebvre.
Cowansville J. McCrum.
Hull T. W. Symmes.

Inspector of Provincial Revenue.

Lévis T. A. Poston.

They may also be obtained from the department at Quebec by applying to A. Brosnan, comptroller of Provincial revenue, treasury department, Quebec.

A. S. M. E. TO DISCUSS AUTO CLUTCHES.

At its next regular monthly meeting, to be held in the Engineering Societies building, 27 West Thirty-ninth street, the American Society of Mechanical Engineers will devote its session to a paper on "Clutches, with Special Reference to the Types Used on Automobiles," by Henry Souther. The development of the various types will be illustrated by means of lantern slides. The meeting will afford an excellent opportunity for the full discussion of the design and use of clutches for all purposes, and it will be continued at the semi-annual meeting of the society at Detroit, June 23-26. The members of the Society of Automobile Engineers have been invited to join in this discussion at Detroit, the third annual summer meeting of the latter being scheduled for June 25-27.

NEW BOOKS FOR AUTOMOBILISTS.

European Automobile Annual.—For the third year in succession Baudry de Saunier's "Annual" of the European automobile industry makes its appearance, similar in general appearance to its predecessors, but enlarged and modified in detail. The compiler of the Annual first seized upon the idea of producing a trade directory giving in alphabetical order everything that the private automobilist or the dealer might possibly desire to know about an automobile or the industry in Europe. Proof of the need of a volume of this nature is found in the sale it has had in France and the fact that foreign publishers have not hesitated to make literal copies.

As a reference book for firms having relations with France and other parts of Europe, the "Annual 1908" is a particularly valuable work, for it gives in the most accessible manner possible information on every constructor in France, the models he produces, explanation of technical terms, the results of all races, lists of members of all the important automobile clubs, the names of all agents and dealers, brief sketches of notable persons in the automobile industry or sport—in brief, it is a complete handbook of the French automobile industry, compiled, for convenient reference, in alphabetical order. The volume, which is well illustrated and handsomely produced, consists of almost a thousand closely printed pages. It is published by L. Baudry de Saunier, 20 Rue Duret, Paris.

LETTERS INTERESTING AND INSTRUCTIVE

INTERESTING QUESTIONS ABOUT A FORD.

Editor THE AUTOMOBILE:

[1,331.]—I have some interesting questions which I wish to have answered through "Letters Interesting and Instructive." I have a Ford, Model F, 16-horsepower, double-opposed motor, on which the pistons were found to be worn so badly that I had new ones provided. The cylinders were also rebored and the valves ground in at the same time. The engine was then reassembled, valves adjusted and timed, and the piping put back in exactly the same manner as it had been previously, all the joints being made tight.

The engine now compresses well on one cylinder and only slightly on the other cylinder, but the cylinder which has poor compression develops as much power as before, while the cylinder with good compression has scarcely enough power to run the engine. A Schebler carbureter is employed, and the suction of the air through it is the same, apparently, for each cylinder. What is the trouble?

Jacksonville, Ill.

F. C. CARRIEL.

Without any further data than what is given in your letter, it seems to us that the trouble can be traced to improper valve and ignition timing. We should advise you to check this over very carefully and see that both the inlet and exhaust valves open and close at exactly the right time; also that the ignition is timed right, as the latter alone might account for the lack of power. You do not say anything about the valve-operating mechanism having been renewed, or checked up for wear, and the difference in the length of the valve stems, the wear on the cams and rollers, etc., may be sufficient to throw the timing out considerably, although it apparently is correct. It will be evident that if the exhaust valve opens too soon much of the power will be lost; or, if the inlet valve remains open too long, much of the charge will be ejected and the compression will naturally seem to be poor when the engine is turned over by hand.

Granted that the cylinders and pistons are tight, which should certainly be the case in view of the work that you have had done on the car, there appears to be little else that can be responsible for the trouble, and we think that if you will go over this part of the engine you will not be long in finding the cause.

STEERING OF THE CHRISTIE AND THE CABS.

Editor THE AUTOMOBILE:

[1,332.]—In a recent discussion, I heard it stated that Walter Christie's 130-horsepower racing car, which he used in the 1907 Grand Prix, was steered by the rear wheels. Kindly let me know if this is so; also if the electric hansoms which are used in New York as taxicabs, steer by the rear wheels.

Garden City, N. Y.

J. BERNARD MILLER.

Christie's racing car, as well as all the cars of the front-driven type that he has turned out, have been built to steer by the front wheels in the usual manner. These wheels are connected to the driving shaft, which is the crankshaft of the motor itself, when on the high speed, through the medium of universal joints which compensate for their lack of alignment when turning corners. Some of the original electric cabs used in New York City were designed to steer by the rear wheels, but we are under the impression that very few, if any, of this type still exist.

ADVANTAGES OF TIRE-FILLING COMPOUNDS.

Editor THE AUTOMOBILE:

[1,333.]—Please give me your opinion if it is advisable to use tires filled with such compounds as glue, glycerine and other ingredients mentioned by you in a recent issue. What are the advantages and disadvantages of such fillings?

Davenport, Ia.

G. TREIMER.

The chief advantage of using tires filled with such compounds is that they are proof against punctures and similar forms of injury. On the other hand, they have the disadvantage of greatly increased weight, loss of resilience to a certain extent, and the difficulty of repairing the tire after it has been filled with these compounds. Probably there are some readers who have had extended experience with tires that have been filled and can give more definite details of both sides of the subject.

ABOUT CONNECTING UP ACCUMULATORS.

Editor THE AUTOMOBILE:

[1,334.]—The manufacturers of a certain car place emphasis on their instructions to always connect up the storage battery in the same way, the positive pole to the coil and the negative to the ground. Another authority claims that in passing from one point to another the electric current carries particles of metal with it—e.g., in the case of timer, vibrator points and spark plugs, one point would be eaten away and the other built up. Hence, he advises reversing the poles of the battery each time it is replaced. Is there any merit in this, or is there any reason for keeping the battery always the same?

H. F. CLARK.

Ventura, Cal.

There is no reason that we know of why the battery connections should always be the same in order to obtain satisfactory ignition service. The authority in question is quite correct, and this action is particularly noticeable in the case of the coil vibrator contact points, less so in the case of the timer, and is absolutely a negligible factor where the spark plug is concerned, owing to the infinitesimal quantity of current passing at the gap of the latter. The action is exactly the same as that of the ordinary arc light, which, when trimmed, is supplied with a negative carbon but half the length of the positive. At the end of its usual period of burning, there is scarcely anything left of the positive carbon, while the negative has hardly decreased in size at all. The action naturally depends upon the amount of current passing, *i.e.*, the amperage. We think it is good practice to reverse the connections each time the battery is replaced.

LEADING AN INQUIRER ASTRAY.

Editor THE AUTOMOBILE:

[1,335.]—It seems that your answer to Mr. Sharkey, Letter No. 1,311, is misleading. His question is plain, though he evidently does not understand the ignition system. I think you will agree with me that his car is all right as it stands, as disconnecting the spark plug could not affect the vibration of the coil.

Cleveland, O.

ANOLDTIMER.

We do not agree with you that the car in question is "all right as it stands," by which you mean its condition as described by the inquirer in question. Your statement that "disconnecting the spark plug *could not* affect the vibration of the coil" is akin to that of the young attorney called upon to get a client out of jail. "Why, man alive, they can't arrest you for that." "I know that," replied the client, "but they have arrested me." Mr. Sharkey states, "When the engine is turned over with the terminal disconnected, the coil vibrates." We informed him that this should not be the case, in answer to his direct inquiry to that effect, and also tried to suggest what appeared to be a cause for it. It goes without saying that this may not actually be the cause of the trouble, but apart from this, we do not consider the answer at all misleading and would like to hear more about it.

INTERESTING CAPITAL IN A NEW STEAMER.

Editor THE AUTOMOBILE:

[1,136.]—Do you consider there is a good field open for a steam automobile of various models, built as good as the best steam car made to-day, with various improvements, such as a kerosene burner, no air pressure, perfect separation of oil from condensed steam, condenser sufficient to condense all the water used, possibly a steam turbine; but if not, a new compound steam engine?

If so, do you suppose it would be possible to interest fifty or a hundred thousand dollars for such a proposition?

Nyack, N. Y.

There is no apparent reason why a well-built steam car along the lines you indicate, turned out by a progressive concern, should lack for a market. Merely because the cars of this type at present being built are in the minority, so far as the number of makers devoted to steam is concerned, is no reason to infer that this is due to the fact that the market for such a car is very limited. It is not easy to build a successful steam car, and this

probably has a good deal to do with it. The possibility of interesting capital is something a bit beyond our ken, but we have no doubt that the right man could do it.

MATERIAL FOR AUTO STEERING KNUCKLES.

Editor THE AUTOMOBILE:

[1,337.]—Please inform me through "Letters Interesting and Instructive" as to the properties required in metal for front axle yokes and knuckles. I suppose toughness and hardness are both required. Is manganese bronze a good material for this? In what respect does it differ from better grades of cast and drop forged steel?

Quitman, Ga.

W. MATHEWS, M.D.

Maximum toughness and hardness are both prime requisites for material to be employed in the construction of steering knuckles and front axle yokes of an automobile. We have known of one or two instances in which manganese bronze has been employed for front axle yokes, the yokes being cast integral with the axle in one piece. So far as we know, the same material has not been used for making the steering knuckles. It has not been extensively employed owing to the greater weight necessary to attain the same result as compared with drop-forgings of alloy steel. Cast steel would not be a good material to employ for steering knuckles, although it has doubtless figured in this rôle on some of the cheaper cars. The parts in question form such a vital factor in the safety of a car that no material can be too good for them. Both the tensile strength and elastic limit of the alloy steels employed for automobile work are higher than is ordinarily attainable with manganese bronze castings, so that drop-forgings of the former naturally weigh much less for the same strength.

ELECTRICAL THEORY OF THE METER QUESTION.

Editor THE AUTOMOBILE:

[1,338.]—In regard to letter No. 1,292, I may help you a little. The current flowing in any circuit is the total voltage divided by the total resistance of the circuit. Let us suppose that the voltage of four dry cells is 5.2 volts, their internal resistance plus that of the primary of the coil and the wiring, 4 ohms. If the American ammeter had a resistance of 5 ohms and the French ammeter 2 ohms, which is relatively possible, the total resistance of the primary circuit when the American meter is used would be 9 ohms and the current $\frac{5.2}{9} = 5.8$ amperes, and 6 ohms when the French meter was used, giving $\frac{5.2}{6} = 8.7$ amperes. Both meters might be

correct, providing the reading indicated was 5.8 and 8.7 amperes respectively. I have taken values merely to illustrate my point.

Furthermore, the tests made do not show much. To be reliable tests, both instruments should have been connected in series with a steady source of current, such as a storage battery, and both instruments read at the same instant. If this was done when the given readings were taken, it only shows that the instrument differs; it does not show which was correct, unless the following information was also secured: The voltage across the terminals of the battery, while the ammeters were being read, and secured by means of a suitable voltmeter that is known to be correct, and the correct resistance of the circuit. This latter should have been measured by a Wheatstone bridge that is known to be correct. Then the correct current could have been calculated. Or an ammeter of suitable range and known to be correct could have been connected in series with both the French and the American instruments, and all three read at the same time.

It may be well to state that the instruments sold for measuring the current from primary cells or storage batteries by automobilists are not usually much better than mere current indicators. For this purpose they are all right and good enough, but they seldom give the current correctly in amperes; in other words, they are not correct reading ammeters. If one has such an instrument and knows what indications it should give for the successful operation of his coil, good ignition, and fair life for his batteries, he is fortunate, and can then make good use of his instrument. With the same number and kind of batteries, its reading is approximately proportional to the current in amperes, probably close enough for practical purposes.

There is another source of error that I have not mentioned, and that is the inductance of the meters. In a primary circuit, the current is rapidly interrupted and the instrument having the greater inductance would produce the greater reduction in the strength of the current, and hence tend to give a smaller reading, unless both instruments had been calibrated with currents interrupted at the same frequency or rate

Scranton, Pa.

FIVE YEARS' SERVICE WITH A CADILLAC.

Editor THE AUTOMOBILE:

[1,339.]—I am interested in your reply to the letter No. 1,312, from Mr. Harrington, in your issue of April 16, about repairs to a Model H Cadillac. I have driven a Model H every year since I bought her in 1903, and she runs better now than she did at first. Of course, I have had her overhauled every winter and worn parts replaced. Last summer I took her on a long trip through Northern New England and a little way into Canada, making a tour of the White Mountains on my way home, and though she has only one cylinder, I found that she could go anywhere that the big fellows could with their four and six cylinders.

I have had the same experience with a worn piston and rings that Mr. Harrington has, and the only thing to do is to buy a new piston. It will cost four or five dollars and the rings eighty cents apiece. If he tries to turn new grooves in the old piston and make special rings, it will certainly cost more, and besides he will always have to have special rings made afterwards, which will cost more.

I have always used medium or light grade Valvoline oil in my engine, and it gives good satisfaction. The great secret of successful lubrication of this engine is to keep always enough oil in the crankcase to cover the bottom from 1-4 to 3-8 of an inch deep. I used to take off the cover of the crankcase and measure the depth of the oil every day, but now I have a drip cock arranged in the bottom of the crankcase and I can keep the oil at the right depth.

I don't think the popping Mr. Harrington asks about is in the carbureter. In all my experience with the Cadillac I have never had a backfire through the carbureter that I know of. In my opinion the popping is caused by the spark plug not being inserted right. The plug in this engine is a special one, about two inches in diameter, and if any dirt gets between the engine and the plug, or if it is not seated properly, a little space is left through which some of the exploding charge will come and make an unmistakable "pop." This is especially so when a heavy load is thrown on the engine, as in starting, or climbing a stiff grade, for then the explosions are stronger. When the engine is running light, the explosions are often not strong enough to get through the space between the spark plug and the engine as above.

Hartford, Conn.

ARTHUR PERKINS.

STEEL TIRED STEAMER SOON ON THE ROAD.

Editor THE AUTOMOBILE:

[1,340.]—My steel tired auto is set up and I am now setting the engines. They are designed to set upright. I am laying them down in a tight box under the floor with a leather end to the box and with two holes for the chain to pass through.

All the automobile men here tell me that it will not work without a differential. I have proved that it will by this simple experiment. I turn the two front wheels as far as they will go, then with one finger hooked on one tooth of the sprocket on drive axle I can run it across the floor and see the wheels slip. The auto with engine weighs 925 pounds, the boiler 300. The day will come when steel tires will be as common as steel-tired wagons and no differential. The actual saving over a good set of auto wheels, rubber tires, and a good differential is about \$500, and when finished the steel wheels will not burst and kill people by going in the ditch. Soon as I get my auto finished, in May, I will run it to New York on purpose for you to inspect. Fifty men interested in automobiles have called to see my auto in its construction and all speak well of it.

Oneonta, N. Y.

M. W. HAZELTON.

"PATHFINDER'S" AVOIDANCE OF JERSEY.

Editor THE AUTOMOBILE:

[1,341.]—It is with much pleasure that I read "Pathfinder's" description of his New York-Philadelphia trip in the April 23 issue of "The Automobile," as I have greatly enjoyed the same route for many years past—both by bicycle and White Steamer—and can highly recommend this route for beauty and pleasure. Some variations can be made, and a better stopping place for the night cannot be found than Peters' Hotel at Bushkill. The drive through the "Gap" is most beautiful and enjoyable, and is just as fascinating to me as it was twenty-five years ago.

From Portland, an easier route is by way of Nazareth, Bethlehem, and via the Bethlehem pike to Chestnut Hill, Philadelphia, to Pelham, and through Fairmount Park to the center of the city. As this is an easy two days' trip, I would advise turning around after passing through the "Gap" and back to the center of the village, then turn left through the beautiful Cherry Valley to Saylorsburg, Wind Gap, and Nazareth, and as above to the city.

Tourists from New York for Wilkes-Barre and Scranton can avoid "Jersey justice" by "Pathfinder's" route to the Water Gap and Stroudsburg—or Bushkill to Stroudsburg direct—then to Bartonsville, and over the beautiful Pocono Mountains to Pocono Summit; left through Stoddardsville to Wilkesbarre, or right through Elmhurst and the Boulevard to Scranton. GEORGE E. FLING.
Germantown, Philadelphia.

Hiram Percy Maxim in His Latest Electric Creation.

SIMPLICITY and compactness distinguish the new Maxim and Goodridge electric, of which the first representative forms the leading illustration on this page. It has been a matter of common knowledge, ever since Hiram Percy Maxim resigned as chief engineer of the now defunct Electric Vehicle Company, last summer, that he and T. W. Goodridge were working on the design of a new electric for which some new features were promised. That the promises have been fulfilled is evident upon a review of the specifications of the power plant of the new car, which marks a decided departure from conventional practice in this respect. In place of the customary gear, or sprocket and chain drive, a worm has been substituted, this form

The Novel Driving Unit.

directly upon it, a vertically divided housing, independent of that of the motor, serving to carry an outboard bearing to support the prolonged end of the driving shaft. This housing is bolted directly to the end of the motor, and the stub ends of the differential shafts project through it, as will be seen in the illustration. It will be apparent that this drive is not only the acme of simplicity, but it accomplishes the necessary drop in speed between the motor and the driving axles by means of a single reduction, a gear ratio of 10 to 1 being employed. In addition to this, it permits of the motor and its drive being made in the form of a

of construction permitting of the extremely compact unit which is illustrated separately.

The armature shaft of the single electric motor is extended several inches and the worm is mounted

much better and permitting of the use of solid rubber tires. The springs are unusually long, which, together with the fact that the entire load is carried by them, is said to make the car as comfortable as the ordinary type equipped with pneumatics. In order to equally distribute the weight, the complete battery is carried forward under a bonnet. It consists of 30 cells of 11 PV Exide, and by means of the arrangement mentioned the weight is so evenly distributed that the new Maxim-Goodridge electric car, with two passengers up, has only 35 pounds more weight on the rear axle than on the forward one. This has an important bearing on the ease of riding and is likewise a material factor in the tire problem.

Another original feature is to be found in the control, the handle being mounted on the steering post just below the steering lever, making it more convenient to operate, besides saving seat room as compared with the usual style, for which it is necessary to sacrifice part of the cushion. The motor is of General Electric make, and by means of a special type, uninterrupted torque, multiple-series controller, five speeds ahead and three reverse, are provided, the maximum forward speed being 18 miles per hour. Fifty miles is about the maximum on a single charge of the batteries, with either pneumatic or solid tires, on ordinary roads, with an increase over this figure on good city pavements. With the battery equipment already mentioned, the weight of the car is 2,100 pounds, being correspondingly less with a smaller battery and simpler type of body. The chassis is entirely self-contained and any type of body desired may be supplied, although the standard is the Victoria-phaeton shown in the illustration. Complete with this equipment the car lists at \$1,800.

Two sets of brakes

single and practically self-contained unit, thus avoiding the necessity of employing the numerous other small parts essential to the customary form of drive.

The mounting of the combined power plant and drive is equally original, this unit being supported from the chassis frame, and being so placed that the differential stubs already referred to stand in approximate alignment with the centers of the rear wheel hubs. The differential is connected to the driving wheels through the medium of two shafts provided with universals, the design being such that these shafts lie in approximately the same plane when the car is carrying its normal load, the joints taking care of inequalities in the road. The axle is offset to allow for the clearance of the universal joints, and, except for this feature, is of the conventional floating design, the rear wheel hubs engaging driving dogs on the ends of the axle shafts.

The entire weight of both the car and its power-plant is thus carried on the springs instead of being "dead" on the rear axle, making the riding of the car

Showing Position of Power Plant.

are provided, one set operating on the drums placed on the driving wheels and the other on the motor shaft, both being pedal operated. An unusually long wheelbase is provided for this type of car—namely, 84 inches—while the running gear consists of 32 by 3 1-2-inch artillery wheels, these two points in the design of the car adding greatly to its ease of riding.

High frictional losses and the fact that, as ordinarily designed, the worm and pinion comprise an irreversible driving set, have militated against its adoption in the past. The problem has been one largely of tooth angle and tooth area, and that is has been successfully solved is evident from the use of the worm on a

number of gasoline cars for the past three years, notably heavy passenger 'buses in London. In the present instance, the designers claim to have greatly improved on anything thus far done in this line, and while the manner in which they have accomplished this is not to be made public, the extremely small frictional losses are evident from the fact that the car can be moved by the slightest effort, while tests of power consumption give positive proof of the low point to which the losses have been reduced. The worm is made of specially hardened steel, both the worm shaft and the motor armature shaft running on D. W. F. ball bearings, the whole unit being tightly housed.

MACHINING AUTOMOBILE CRANKSHAFT BRASSES

SOME time ago a correspondent showed a set of jigs and fixtures for machining automobile crankshaft and connecting-rod brasses. As we do very large quantities of these, I can speak with some authority on this subject, says R. Roton, in the *American Machinist*. Some tools make them in good time, but

for assembling, it is extremely annoying to find that they will not match or that they are not interchangeable.

This means trouble and also expense, so we designed the tackle shown, which gets over the difficulty, and has saved its cost many times over, as all the brasses bored and turned on it are absolutely interchangeable, the joint being dead central every time. *A* is a gray-iron face plate for the capstan lathe; *B* is a lug milled on the top edges as shown, across the center, on which the milled half bushes are laid. *C* is a rib for supporting *B*; *D* is a boss for carrying the screwed pin *F*. *E* is a similar boss to *D*, for supporting *J*, which carries the swinging eyebolt *I*. *G* is a small cotter pin passing through *F* to keep the swinging clamp *H* in position, which is tightened down by *K*, operating on *I* through a slot in the end of *H*. *X* shows the half brass bush in position for boring and turning the front collar on the fixture. After it is bored and the front collar faced and turned, it is turned round and a hardened, ground, locating mandrel fits in the hollow spindle, on to which the half bush is clamped, as before. The back is then turned and faced, the end fitting tight up against the machined face plate; the front end is turned and faced to length, the diameter of the two collars being exactly the same.

The bushes are then taken to the engine lathe and turned on the mandrel shown in Fig. 3, which is hardened and ground. *L* is the part where the driver is clamped on; *M* is a collar solid with the shaft, a section of which is shown at Fig. 4. *N* is a similar loose collar; *O* is the nut for securing the lot. *X* shows a dotted bush in position for turning. It will be seen that the recessed insides of the two collars *M* and *N* grip the collared ends of the bushes and close them on the mandrel, which should be a good fit on the body. The tighter the nut *O* is gripped, the more the bushes are closed on the mandrel, and thus held true in position for turning the body or middle part. Brasses done by this method save a lot of time in assembling, and the operation of sweating the two halves together is entirely obviated, which is a very desirable feature, as when the soft solder is in the joints it opens them 0.005 to 0.010 inch and has to be scraped out afterward by hand to get them to a true circle.

in the boring and turning of the brasses the two halves for making a complete bearing are not always equal. This is due to the method of setting the brasses for boring, the process being first to sweat the two halves together, then file a small groove across the joint, and locate it centrally by two pointed screws on the face plate for that purpose. When the brasses are taken apart

IN EXPLANATION OF CARBURETER BACK-FIRING

OF all the carbureter troubles that have mystified the novices of each succeeding season, probably there is none that has proved so utterly puzzling, as well as alarming, as that of popping or back-firing, says *The Motorist*. This mysterious saiment has a habit of appearing with an irregularity that is disconcerting, and which makes it appear as if it were not the outcome of any particular combination of circumstances, as would be the case were its presence only an accompaniment of certain visible and easily-detected symptoms. But it comes and goes unexpectedly, at times reaching proportions that are alarming, particularly when flames shoot out of the air inlet of the carbureter—an occurrence

which gives the average driver visions of a conflagration and the smoking ruins of his car. It is difficult for him to understand why this fire should not ignite either the gasoline or the vapor itself that is in the carbureter at the time, and send the whole car up in flames. Simply because the former does not ignite readily, due to the fact that it is almost pure vapor with little or no air, and the flame passes over the latter at such a speed that it has not time to take fire. Even though the spray issuing from the jet should take fire, the flame could not travel back through the spray nozzle to the float chamber, and it would be extinguished by the next inrush of air immediately following.

RENTING AND COST ACCOUNTING CONSIDERED

By LORENZO B. BAKER.

TOTAL profit of all departments of a business cannot be greater than the sum total of the profit of each department. Hence, it is just as important to know the result in each department as to know the result as a whole, for an unsuspected loss in one department may be overcome and hidden by the profit in another. Any condition thus hidden is as dangerous to a business as a hidden bomb is to unpopular royalty. The dealer who has such spots in his business will in the last analysis always lose out to his competitor who has none.

Native shrewdness is not a match for just common every-day judgment, when the latter is based on facts regarding detail, which the former is apt to ignore. Manifest advantages of location, capital, and shrewdness cannot, in the long run, hold their own against analyzed facts well digested.

It is not my purpose to introduce a lot of figures to show the cost of operating cars, or to illustrate the possible profit or loss that may result. Let us first determine whether or not it is worth while to inquire into the matter and to so shape the accounting as to show it.

How many can tell whether or not they make a profit from the rental on cars? Of those who think they make a profit on rentals, how many can tell *how much* they make on this department of their business? Few, indeed, are those who can give a reasonably satisfactory answer to the latter question.

What reason is there for renting cars unless you are thereby able to make a profit that could not be made in any one or all of the other departments of the business?

When a department is here spoken of, it is not necessary to suppose that it implies a number of men and their foreman. Instead, it is the designation of an element in the analysis of business. If one man does all of the work, he may be considered the repair department at one time during the day, and the office force at another. Manifestly, it is not fair to penalize one department for the advantage of another; therefore, if the repair department makes repairs on a rental car, these repairs should be charged for at not less than cost. Of what, then, does this cost consist? Certainly of the value of materials and parts used, and of labor. But is this all? If the dealer was to charge other customers on this basis, he would soon go out of business, because the real cost consists not only of material and labor, but also of rent, depreciation, general expense, etc.

If, then, a method could be determined that would correctly apportion to the repair department, its share of all overhead expense, would the resulting charge to the rented auto for the cost of repair, consisting of material, labor and overhead, be the correct charge for the repair? We find at this point that there are two methods possible, and that either will give results, and the intimate knowledge that it has been contended is necessary.

If costs were thus transferred from repair department to the rental department, there would not result any hidden losses, and the entire expenditure for repairs would be known. There is a reason, however, for saying that by stopping at this point in our costs, we have allowed the rental department to show a profit that, in part, belonged to the repair department.

Is not the repair department entitled to the same profit on its work for the rented car, as on work for outside parties? Is there any reason why a profit should not be made on cars rented above the amount that repairs would cost, if purchased outside?

The rental department may rightly be considered as a business by itself, and, when so considered, it is entitled to a profit on the rental element alone, presupposing that all accessories, gasoline, repairs, etc., are bought in the open market, and that on them there has been made a reasonable profit. Why should the auto renter cheat himself of one profit? He is entitled to two profits—one on repairs, supplies or accessories as a dealer, and the other as a renter of cars. He may consider himself as a liveryman, who buys his carriage horses, feed and repairs. A liveryman does not run either a wagon shop that he may repair his buggies, or a harness shop to repair his harness, or a farm to raise his feed, and he expects to make a profit after paying some one else a profit on these articles.

There are several other elements of importance that enter into the cost of the rental of cars that cannot be considered in detail here. Managers may ask if it would not be necessary to employ a high-priced bookkeeper to secure the kind of accounting here advocated.

We find in all departments of industry that results seemingly complicated are attained by simple means, because of the thought that has prepared a way that any person of average ability may easily follow. So it is as regards the accounting that is necessary to properly exhibit these costs. It does not involve more skill than is possessed by an average bookkeeper.

How Henry Ford Utilizes an Automobile Plow of His Own Design on His Farm Near Detroit.

Mr. Ford predicts that the next ten years will see automobiles in use doing work of so varied a kind that, even with all our knowledge and our preparedness to accept almost any advance, we dare not anticipate, and that one of the sure developments will be in the way of self-propelled farm implements.

DEDUCTIONS FROM THE BRIARCLIFF RACE.

Among the features that characterized the running of the race for the Briarcliff trophy over a course that was concededly impossible, none stand out with more prominence than the remarkable uniformity with which such a very large proportion of the contestants continued to reel off lap after lap, and the positively marvelous manner in which tires endured strains of a severity far beyond what they had ever been called upon to meet in any road racing event up to the present. Figuring by precedent, and adding a generous percentage to allow for the vast difference in the nature of the course, as compared with that on which the Vanderbilt race has been run, it was confidently predicted that half of the contestants would see their chances ruined in the first lap. The succeeding lap or two were counted upon to be equally effective in eliminating probably as many more of those that remained, while it was scarcely thought possible that there would be more than a handful still running when the yellow flag should bring the race to its official end.

The actual results show how very far wrong were all these predictions. The dolorous head-shakings of the wise ones as to the frequency with which tires would have to be changed, and the numerous prophecies, based on experience, regarding the wide swath one or two laps of that course would cut in the ranks of the competing cars, all went for naught, as did equally the somber forecasts of those who thought that the services of the ambulance would be in great demand. The regularity with

which the cars ran and the manner in which their tires stood the terrific strain, are matters that can be explained by the simple word improvement; but that none of the spectators were killed is one of those profound mysteries that only the quotation of such proverbs as “There is a special Providence that looks after, etc.” can serve to throw any light on. The nature of the country, however, forced people off the road and up the bank to gain points of vantage, and thousands were forced to places of safety.

Taken all in all, the Briarcliff trophy race was a successful event of its kind, but if stock touring car races are to form a permanent feature of automobile racing, as it seems very probable they will, they should not belie their name as this one did. Just what a stock car is will have to be defined much more closely. The maker who turns out a limited number of a specially fast type of car to order is justified in calling it a stock car, as it complies with the requirement that he shall have built not less than ten duplicates of it, but it places him in a vastly superior position to the entrant who lists a type of car designed for the needs of the many, and of which he is turning out hundreds, or thousands, annually. In a race where speed alone is the consideration, no fault can be found with whatever type of car is employed to attain that end, but where the principal object is to display the staying qualities, combined with speed, of the type of car that the average autoist wishes to own, it is surely a travesty to permit the palm to be carried off by representatives of a speed model, destined to be produced in very limited numbers. In last week's race, this applied quite as much to some of those that did not win, as to those that figured prominently in the honors.

All the entrants must be placed on an equality as far as possible, and to achieve this there must be a more effective means of defining exactly what a stock car is. It is all very well to limit its piston displacement, thus barring very high-powered cars, but the stock car, to fulfill the requirements of its title, must be the generally salable product of its maker, and not the special speed design turned out to meet the wants of a very few. That more than ten duplicates of the car entered should have been turned out would be necessary, and it would also be well to so alter the rules as to make the committee the arbiter of this point. Why should not the committee actually choose the car at the factory?

ENGINEERING DATA ON THE AUTOMOBILE.

Mechanical engineering was a pretty staid and settled science long before anyone thought it worth while to attempt to preserve data on its multitudinous features, but, then, progress was not over rapid a century or more ago. Despite the vast volume of valuable data that has been compiled in the last fifty years or so, there is a large part of it that is not applicable to automobile engineering. A great deal of matter well worthy of preservation, and of value to automobile builders, has been written in the past seven or eight years, and, as automobile engineering is a very new branch of the science that represents a radical departure from standards current in other lines, much inconvenience has resulted from inability to find this data. It is a matter for congratulation, therefore, that a well-known designer has undertaken the compilation of an automobile engineer's handbook.

NEW YORK'S BILL AT SPECIAL SESSION.

ALBANY, N. Y., April 26.—The Armstrong-Merritt automobile bill may be taken up at the special session of the Legislature, called by Governor Hughes for next month. It will be remembered that Senator Armstrong moved on the day before adjournment to recommit the measure to the committee, stating that it required essential though slight revision before final passage. In the bill as first introduced the annual registration fees ran from \$3 to \$13, these being the figures proposed by Oliver A. Quayle, president of the New York State Automobile Association. Subsequently A. R. Shattuck, a New York City automobilist, assuming to represent the A. C. A., was responsible for increasing the fees from \$5 to about \$40 for the highest powered cars. Later, at a final conference concerning the measure, W. W. Niles, attorney for the A. C. A., supported Senator Armstrong in insisting upon a jail penalty for a first offense, which proposition was opposed by President Quayle, of the State association, and President W. H. Hotchkiss, of the A. A. A. While it is true that all speed limits are eliminated, not a few automobilists are questioning whether the vastly increased fees and the jail clause are a commensurate exchange for the abolition of speed traps.

Governor Hughes Will Recommend that It Be Included.

ALBANY, N. Y., April 29.—Senator Jotham P. Allds had a conference with Governor Hughes yesterday afternoon and found the Governor favorably disposed to recommending to the extraordinary session of the Legislature the Armstrong-Merritt Motor Vehicle bill. The Governor was informed how the Senators and Assemblymen in charge of the bill—Armstrong, Allds and Merritt—were busy up to the last moment of the session, so that they had no time to perfect the bill in several particulars and get it amended in time to pass it even with the aid of an emergency message. The Governor appreciates, as do the legislators, that the State will lose for another year nearly half a million dollars if this proposed new scheme of registration or taxation of motor vehicles is not enacted into law.

VAN SICKLEN RESIGNS ; GORHAM SUCCEEDS.

CHICAGO, April 27.—N. H. Van Sicklen, who has served as secretary of the Chicago Automobile Club since last fall, has resigned because of contemplated absence from the city. 'Tis said "Van" will try the quiet life of a farmer at St. Charles, Ill. To fill his unexpired term Sidney S. Gorham, who was secretary of the organization for four terms, has been selected by the board of managers. Mr. Van Sicklen's resignation was accepted with considerable regret, as he has long been an active favor in the affairs of the club. He has also resigned as chairman of the technical board of the American Automobile Association.

THEATRICAL TAXICABS FOR NEW YORK CITY.

Further details of the enterprise which will maintain a special theatre service of taxicabs are now forthcoming. The Front Drive Motor Car Company is the name of the concern which has been incorporated with a capital of \$250,000. W. Gould Brokaw and Morris Gest, of the theatrical firm of Comstock & Gest, are the backers, and it is said that theatrical firms have already subscribed for stock. Walter Christie is the designer of the car, which will be of the front-drive type, the entire power plant and transmission being in self-contained unit form and readily detachable. A twelve-story building, now in course of construction, constitutes the main station.

LONG ISLAND STRAIGHTAWAY RACES, JUNE 5.

Under the auspices of the Long Island Automobile Club, arrangements are being perfected for the holding of straightaway races on Hillside avenue, just outside of Jamaica, L. I., the day and date being Friday, June 5, and the affair being a part of the celebration of the opening of the Long Island subways. A. R. Pardington is to be the general manager, and the course is to be police guarded. Hillside avenue will supply a model course.

THE 1908 VANDERBILT CUP COURSE ?

Whether the Vanderbilt Cup course for 1908 will be located in Georgia or Connecticut yet remains to be definitely decided, with indications at present favoring Savannah. A definite announcement is expected in the near future. Harvey W. Granger and Secretary A. W. Solomon, of the Savannah Automobile Club, have been in the city this week, conferring with Chairman Jefferson deMont Thompson and other members of the A. A. A. Racing Board, who are also of the Cup Commission.

OSBORNE I. YELLOTT'S UNLUCKY REPAIRING.

BALTIMORE, April 27.—Osborne I. Yellott, counsel for the Automobile Club of Maryland, was burned about the face and hands while repairing his automobile. He was lying on his back under the machine when the vapor, from oil which dripped on Mr. Yellott's face and hands from a broken gasoline pipe, spread to a lamp which exploded. Farm hands smothered the flames with horse blankets. It may be necessary to call upon friends to furnish cuticle for grafting skin over the burns on Mr. Yellott's face and hands.

A. M. C. M. A. SHOW OPENS NEW YEAR'S EVE.

New Year's Eve, a great gala night in New York, has been finally chosen for the opening of the show of the American Motor Car Manufacturers' Association, at Grand Central Palace. It will continue for eight days, thus making the show dates December 31, 1908, to January 7, 1909.

In choosing the opening week of the year, the promoters believe the date chosen will prove an ideal one from the fact that during the first week of the year something like 150 big railroad and industrial corporations pay out from New York almost \$200,000,000 in dividends on stocks, without reference to bonds, mortgages and other securities. Much of this money each year has gone into the purchase of automobiles.

GLIDDEN PATHFINDERS START THIS WEEK.

BUFFALO, April 28.—Dai Lewis, secretary of the A. A. A. Touring Board, plans to start Friday morning to lay out the route for the annual national reliability test. He will be accompanied by an assistant and a photographer. Every mile of the road will be measured and notes and photographs for the guide book of the tour taken. The pathfinding trip will be made in a Premier, which, by the way, will also serve as a confetti car on the tour itself. The Premier, it will be remembered, was the only four-cylinder car selling under \$3,500 competing for the Glidden trophy which evolved last year with a perfect score. Leon Myron Bradley, of the A. M. C. M. A. staff, will accompany Secretary Lewis as representative of the Premier Motor Car Company.

JUDGE GARY NAMES HIS COMMITTEEMEN.

Judge E. H. Gary, the new president of the Automobile Club of America, has announced his standing committees for the year so far as they have been determined upon by him. In many cases only the chairman has been named, the selection of their associates not yet having been completed. The most important committee of all is the executive committee, which will practically have charge of the affairs and the actual running of the club itself. Henry Sanderson, the first vice-president, is chairman of this committee, which also contains Dave H. Morris, Colgate Hoyt and Edgar L. Marston.

Chairmen of the most prominent committees are as follows: Good roads, A. R. Shattuck; entertainment, Orrel A. Parker; bureau of tours, Waldron Williams; contests, Robert Lee Morrell; racing, Samuel B. Stevens; technical, Dr. S. S. Wheeler; laws and ordinances, Phillip T. Dodge; city streets, W. W. Niles; foreign relations, John E. Bourne; public safety, George F. Chamberlin.

Around the Festive Board at the Hotel Astor Were Many Well-known Autolsts In and Out of the Trade.

"WAG" GETS A BANQUET AND A STOP WATCH.

NEW YORK, April 27.—It is no exaggeration to say that "Wag" was given "the time of his life" at the Hotel Astor on Sunday night, when a few of his intimate friends to the number of forty-six gave him a banquet and a very useful souvenir of their affection. Though the affair was hastily gotten up, there was a ready response to the invitations, few hesitating either at Sabbath breaking or even leaving suburban homes on a Sunday night to participate in jolly along such a popular veteran of both bicycling and automobiling as this same Fred J. Wagner. In the gathering were men prominent in the sport and industry and not a few veterans of the old bicycle days gone by, all now, however, included in the automobile fold. Those who could not be present sent letters, and there were telegrams, too, from distant points.

E. E. Schwarzkopf, "Wag's" proverbial pinochle partner, starting the game of jolly that was played with humor and sincerity the whole evening, and concluded by the presentation of a gold stop watch. "Wag" proved he had sentiment and not a little poetry in his composition by his "come back." Robert Lee Morrell was then installed as toastmaster, and he saw to it that as many of the post-prandial orators as possible within the midnight limit got a chance to get rid of what was on their minds. All had stories to tell of "Wag," and all handed it to him good and plenty. Some even sprung poetry on the old man, and R. H. Johnston went so far as to immortalize him in a song with a chorus that all quickly learned and sang with a will.

Among those who got rid of the jollies and the reminiscences that were on their minds before the lid was put on were: A. R. Pardington, Charles Jerome Edwards, George W. Bennett, Benjamin Briscoe, E. R. Hollander, Alfred Reeves, E. S. Partridge, Henry Caldwell, Guy Vaughan, Joseph W. Gilbert, R. A. Field, A. G. Batchelder, John C. Wetmore, Thomas Francis Moore, R. B. Johnston and Nathan Lazarnick. Others of "Wag's" friends present were: Arthur N. Jervis, H. T. Clinton, Thomas Wetzel, J. S. Draper, L. D. Rockwell, W. J. Morgan, A. J. Picard, S. W. Merrihew, A. L. Kull, A. B. Tucker, W. W. Burke, Cortlandt Cramp, Duncan Curry, Harry Fosdick, C. F. Wyckoff, A. W. Church, Frank Crane, A. L. McMurtry, Alexander Dow and John Williams. Telegrams were read from W. E. Metzger, Louis R. Smith, E. LeRoy Pelletier and others.

The college room of the Hotel Astor was most artistically decorated, flags and flowers being utilized generously in making the cozy banquet room decidedly inviting. It was well after midnight before the festivities concluded.

CONNECTICUT ACQUIRES BASIC COIL PATENT.

By the purchase of United States patent No. 884,116, issued to E. Q. Williams, of Syracuse, N. Y., on April 7 last, the Connecticut Telephone and Electric Company, Meriden, Conn., has acquired exclusive rights to the manufacture and sale of the multiple unit type of induction coil now universally used on automobiles. Mr. Williams was the unquestioned originator of the removable unit multiple coil, as shown by the fact that his application for a patent dates back to December 28, 1904, the delay in finally issuing a patent being due to the fact that it was involved in an interference with the claims of Richard Varley on the same form of construction. A final judgment of priority of invention having been granted to Mr. Williams, together with the very early filing date of his application, gives his patent precedence over all others filed and issued subsequently to 1904.

The patent in question contains no less than 57 separate claims, fully covering the now general removable unit construction, single and duplex battery switches on the coil containing case, and similar features. After carefully investigating Mr. Williams' claims and thoroughly establishing his priority in the art, the Connecticut company immediately acquired the patent and all rights thereunder. The Connecticut coils will be made under this patent, in addition to retaining the numerous features which have distinguished them in the past, while Mr. Williams will continue to manufacture the coils as previously, under an agreement with the new owners of the patent. The Connecticut company holds numerous patents, both issued and pending, on the special features of its coils, and will undertake a vigorous campaign against infringers. The outcome of this new development of the patent situation will be looked forward to with interest, basic patents having cropped up, from time to time, on the majority of the principal features of automobile construction and accessories.

HEAVY REGISTRATION IN PENNSYLVANIA.

PHILADELPHIA, April 27.—Figures recently issued by the Highway Department of Pennsylvania show that during the months of January, February and March there were issued by the authorities at Harrisburg no less than 14,500 licenses to operate motor vehicles in the State. These, at \$3 each, will provide much more than the amount necessary to run the department, and with three-fourths of the year yet to hear from, it is reasonable to presume that the total registrations will easily pass the 20,000 mark. Last year's total was about 1,500 short of that figure.

ACTIVITIES IN AUTO CLUBDOM'S REALM

BURLINGTON CLUB TAKES NEW LEASE OF LIFE.

BURLINGTON, VT., April 27.—Last Tuesday evening, the Burlington Automobile Club held one of the most enthusiastic meetings in its history. A large number of new members were admitted, and W. A. Suydam was elected as corresponding secretary. Three new standing committees were appointed, as follows: Legislation, A. C. Whiting, A. G. Whittemore, J. S. Patrick; good roads, Capt. E. P. Woodbury, B. L. Kent, F. L. North; by-laws, W. A. Suydam, C. L. Woodbury, G. A. Churchill. President Hawley spoke strongly in favor of better roads and regulations to govern same, and in favor of enforcing the law to require selectmen to provide sign boards at all turns and cross-roads in the townships. The proposition of holding a parade and banquet on Decoration Day was left to the executive officers of the club to decide upon. The club will tender the use of the members' autos to disabled war veterans on that day, to convey them to the grave decorating ceremonies at the cemeteries.

FULLER RE-ELECTED PRESIDENT NUTMEGGERS.

NEW HAVEN, CONN., April 27.—At the annual meeting of the Connecticut Automobile Association, held in this city last Wednesday evening, W. F. Fuller, president of the Automobile Club of Hartford, was re-elected president, and Secretary G. K. Dustin was again chosen as secretary. Dr. Hertzber, of Stamford, was chosen as treasurer. The Willimantic Automobile Club, recently organized, was admitted to membership.

Plans were formulated for greatly extending the usefulness of the State association, and Secretary Dustin was authorized to pay official visits to towns in the State where the automobile interests warrant the formation of local clubs, with the view of rendering all the assistance possible. The next meeting of the State association will be held at Bridgeport, May 30.

GRAND RAPIDS CLUB ELECTS NEW OFFICERS.

GRAND RAPIDS, MICH., April 27.—The Grand Rapids Auto Club has held its election of officers, which resulted as follows: D. Emmett Welsh, formerly treasurer, and also secretary of the State association, was elected president, and J. R. Jackson, member of the touring board, A. A. A., and treasurer of the State association, was elected vice-president. Dr. William Burleson was made secretary, and Lewis C. Parmenter, treasurer; board of governors, A. A. Barber, George W. Hart, and W. D. Vandecar.

There is a possibility that the club will abandon its Cascade clubhouse, about eight miles southeast of the city, and decide on a clubhouse north of the city, on Grand river, near Plainfield.

ENTRY BLANKS FOR SPORT HILL CLIMB READY.

BRIDGEPORT, CONN., April 27.—With the advent of "good going," the Automobile Club of Bridgeport is exhibiting an enthusiastic activity. Entry blanks have been issued for the annual hill-climb at Sport Hill on Memorial Day, May 30, and the lists are filling up rapidly for that event. Nine classes for cars ranging in price from \$850 to \$4,000 and over, and including a free-for-all, and the Cranford Cup for amateur drivers is on the program. It is expected the course will be patrolled by the Fourth Company, Coast Artillery, Connecticut National Guard, in command of Capt. George E. Hawes.

At the recent annual meeting of the club, the following officers were named for the ensuing year: President, Frank T. Staples; vice-president, F. A. Strong; secretary, F. W. Bolande; treasurer, L. B. Powe. Silas Burton, Ralph M. Sperry, and A. K. L. Watson were named as governors. Under an amendment to the constitution, the board of governors was increased by six members. The following were elected: De Ver H. Warner, Charles B. Read, Dr. H. S. Miles, J. B. Lyford, F. A. Rantz, and J. T. Fray.

State Highway Commissioner James H. Macdonald addressed the meeting in an interesting talk on the subject of State roads, and the relation of the automobile to the maintenance of good roads. Mr. Macdonald was elected an honorary member of the club. The club is about to adopt new colors. A committee is now at work deciding upon a simple and effective banner, which will be introduced this season.

TEST RUN AT WILMINGTON, DEL., MAY 17.

WILMINGTON, DEL., April 23.—Wilmington will have its first actual automobile run on May 17, when there will be an ability run under the auspices of the Delaware Automobile Association. It will be over a 45-mile course, which will include Avondale, Kennett Square and Westchester, Pa. The cars will run under sealed orders, so that each will not know what handicap has been allowed, the object being to give all cars, regardless of power, an equal chance. The association has placed the entrance fee of its members at \$2 each, and for non-members at \$5. Valuable prizes will be given to the winners.

INDIANA CLUB TO HAVE ROAD RACE.

INDIANAPOLIS, IND., April 27.—The Indiana Automobile Club, the strongest organization of its kind in the State, is preparing a program of road races for July 4. While the club is opposed to track racing, it believes that a good program of road races would be interesting. The course contemplated is only four miles long, starting at the Thirtieth street entrance of Riverside Park, thence west up the hill at the west side of the park to the

Referee R. H. Johnston, of White Steamer Pathfinder Fame, and His Associate Harrisburg Run Path-Layers.

first roadway running south, from where there will be a straight run to Emrichsville, returning over the Riverside Boulevard. About half of the course is in view of the park, and it is proposed to erect a grandstand, the proceeds from which would likely pay the expenses of the races.

Drivers of note from all parts of the country are expected to enter, and C. G. Fisher has offered to donate a \$500 cup. It is proposed to begin racing at 5 o'clock in the morning, and to employ 150 special policemen to keep the course clear.

WILLIAMSPORT HILL CLIMB TO BE HELD JUNE 6.

WILLIAMSPORT, PA., April 27.—Sanction for the second annual hill-climb of the Williamsport Automobile Club has been obtained from the A. A. A. racing board, and June 6 is officially announced as the date. There will be fourteen classes on the program, for which silver cups will be awarded, and the car making the fastest time of the day will be awarded a special cup valued at \$100.

The course is exactly one mile long, and the grade rises from 14 per cent. at the start to 11 1-2 per cent. at the finish. The rise is 407 feet, and the road is of boulevard construction. By reason of the smoothness of the road and the fact of the few curves in it, there is every expectation that the world's record for a mile hill-climb may be broken. There were twenty-one cars in last year's race, and it is expected that the number will be largely increased this year.

SPRING AWAKENS RUBBER CITY AUTOISTS.

AKRON, O., April 27.—These sunny spring days have warmed the members of the Akron Automobile Club into life and a resolve to reorganize the club, which of late has rather drifted into innocuous disquietude. A meeting for this purpose is soon to be called. A year ago there were less than 300 owners in this city, but now there are over 400, and the necessity of an active club is felt. The first run of the Cleveland Automobile Club will be to the lakes, south of Akron, and will bring a big crowd of Cleveland autoists and machines.

TROJANS FORM AN AUTOMOBILE CLUB.

TROY, N. Y., April 27.—The Automobile Club of Troy has effected a preliminary organization and chosen the following officers: President, Frank B. Twining; vice-president, E. S. Platt; secretary and treasurer, Alonzo McConihe. They and the following will make up the board of directors: G. A. Cluett, LeGrand C. Cramer, H. S. Ide, John McGlynn, J. J. Murphy, R. C. Reynolds, John Squires and Dr. L. R. Whitney.

AUTOMOBILE CLUB ORGANIZED AT MARIETTA, O.

MARIETTA, O., April 27.—At a meeting of automobilists of this city and vicinity, held last week, the Marietta Automobile Club was organized with the following officers: President, H. B. Coen; secretary, Joseph Baxter. There are some seventy owners of automobiles in Marietta, and it is hoped to interest all of these in the new organizations.

CLEVELAND CLUB WILL HAVE BUSY SEASON.

CLEVELAND, April 27.—The officers of the Cleveland Automobile Club are preparing for an active summer's work and are planning numerous club runs in addition to the hill climb and many minor events. The runs and tours committee of the club has drafted an excellent schedule for the season.

GLIDE CLUB PLANS RUNS FOR PEORIANS.

PEORIA, ILL., April 27.—The runs and tours committee of the Glide Automobile Club has arranged for a series of runs and has issued a schedule therefor, starting on May 1 and ending on September 26, some of them of two or three days' duration, embracing Sundays.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

- June 25-27.....—Detroit, Third Annual Summer Meeting of Society of Automobile Engineers.
 January, 1909.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. (Exact date to be announced.)
 February, 1909.....—Chicago, Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Race Meets, Hill Climbs, Etc.

- May 4-5.....—Harrisburg-Philadelphia and Return, 300-mile Endurance Run, Motor Club of Harrisburg.
 May 15.....—Chicago, Algonquin Hill Climb, Chicago Motor Club.
 May 16.....—Hartford, Conn., 200-mile Endurance Run, Automobile Club of Hartford.
 May 30.....—Bridgeport, Conn., Sport Hill Climb, Bridgeport Automobile Club.
 May 30.....—Wilkes-Barre, Pa., Glant's Despair Hill Climb, Automobile Club of Wilkes-Barre.
 May 30.....—San Francisco, Endurance Run under the auspices of the Automobile Dealers' Association.
 June 6.....—Worcester, Mass., Dead Horse Hill Climb, Worcester Automobile Club.
 June 24-27.....—Chicago, 1,200-mile Reliability Run, Chicago Motor Club.
 July 7-8.....—Buffalo, N. Y., National Convention of the American Automobile Association.
 July 9.....—Buffalo, N. Y., Start of the Fifth Annual A. A. A. Reliability Touring Contest.
 Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, under the auspices of the Automobile Dealers' Association of San Francisco.
 Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

FOREIGN.

Shows.

- May 17-31.....—Austria, Budapest Automobile Show.
 May 17-June 2.....—Moscow, Russia, International Automobile Exposition, Automobile Club of Moscow.
 December.....—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Race Meets, Hill Climbs, Etc.

- Apr. 25-May 25.....—Industrial Vehicle Competition, Automobile Club of France.
 May.....—Paris, Competition for Agricultural Automobiles, auspices of "L'Auto." (Date to be announced.)
 May 7.....—Sicily, Palermo, Targa Florio Circuit, Voiturette Race, Automobile Club of Italy.
 May 11-16.....—Ireland, Irish Reliability Trials.
 May 1-31.....—Automobile Taxicab Competition, France, Automobile Club of France.
 May 10.....—Sicily, Targa Florio, Automobile Club of Italy.
 May 31.....—Russia, St. Petersburg to Moscow Race.
 June 1-18.....—Reliability Trials for Pleasure Cars, Automobile Club of Great Britain.
 June 14.....—Mount Cenis Hill Climb, for Voiturettes.
 June 9-17.....—Touring Competition for the Prince Henry of Prussia Prize, Germany, Imperial Automobile Club.
 June 15-19.....—Scotland, Scottish Reliability Trials.
 July 6.....—Voiturette Grand Prix, Dieppe Circuit (Automobile Club of France).
 July 7.....—Grand Prix of Automobile Club of France, Dieppe Circuit.
 July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.
 July 20-30.....—Ardennes Circuit Races and Coupe de Liedekerke, Automobile Club of Belgium.
 Aug.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)
 Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vauclussen Automobile Club.
 Sept. 1-8.....—French Voiturette Contest, auspices of "L'Auto."
 Sept. 6.....—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.
 Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

ANTHONY-HATCHER COMPANY ORGANIZED.

GRAND RAPIDS, MICH., April 28.—A stock company, to be known as the Anthony-Hatcher Company, has just been formed in this city for the manufacture of automobiles, trucks, and parts. The automobile portion of the enterprise with which the company is now concerned is the exploitation of the Soule automobile delivery wagon, formerly located in this city, but which was removed to Kalamazoo some two years ago. It is stated that the business with this product has grown gradually but surely, and that the new company intends to forward its interests, again removing to this city and manufacturing. The company is capitalized at \$20,000. George E. Anthony and William A. Hatcher, who were engaged in winding up the affairs of the automobile department of the Harrison Wagon Works, are the principal stockholders.

MEZGER GOES IN FOR WIND SHIELDS.

Having made no little success in the manufacture of spark plugs and other ignition accessories, C. A. Mezger, Inc., 1759 Broadway, New York, has gone into the manufacture of windshields, having acquired the rights to the Conover automatic folding windshield, which was fully described in THE AUTOMOBILE of May 30, 1907. Mr. Mezger has renamed it the "Automatic," and it merits this title, due to its great simplicity, as there are no bolts or nuts

Details of the Mezger "Automatic" Windshield.

to be adjusted and it can readily be operated by the driver with one hand. The frame and fittings are entirely of brass and the latter are so constructed that it is entirely rattle-proof. The design and details of construction are fully covered by American and foreign patents. The National Sales Corporation, 296 Broadway, New York, are factory sales managers.

THINGS DOING AMONG THE GARAGES.

New York City.—A new garage is to be erected for the New York Taxicab Company, on Fifty-seventh street, between Eleventh and Twelfth avenues. It will be a four-story building of brick and concrete construction, and will contain the business office, repair shop, garage and storehouse of the company. It will be most completely equipped, and according to Harry N. Allen, president of the company, it will be ready for occupancy by September 1 next.

Detroit.—The new garage of the Westminster Auto Company, at 71-75 Mott avenue, has been completed and is now open. The company is backed by the same concern as the Broadway Auto Company, 36-40 John R street. C. S. Ross is in charge of the new establishment.

Newark, N. J.—Contracts have been placed for the construction of a two-story brick garage and dwelling at 401 Clinton avenue. The building is to be erected for William Bowdin and the first floor will be used for garage purposes.

The New Winton "Six-Teen-Six" at the Capital.

First and Second Secretaries of the Mexican Embassy at Washington, in a Winton "Six-Teen-Six," before the building housing the State, War and Navy Departments, and situated next to the White House.

"MUDLARK" LOCATES IN OHIO'S TIRETOWN.

AKRON, O., April 27.—Fred Work, who has made a number of memorable transcontinental and Southern trips, is having an Oldsmobile of special make manufactured. He has been at the factory of the company looking after the designs of the body in accordance with some of his special ideas. The "Mudlark," in which Fred Work, A. Auble and Ralph Owen made a trip from New York to Florida two years ago and in which Owen repeated the trip over another route last Winter, has been purchased by the Akron Automobile Garage Company, and will be located here permanently for advertising and demonstrating purposes.

STODDARD-DAYTON PLANT AGAIN COMPLETE.

DAYTON, O., April 27.—Before the smoke of the recent fire which visited the plant of the Dayton Motor Car Company, the work of rebuilding was begun, and the occasion of the completion of the large new concrete building was fittingly commemorated last week by the presentation of a handsome American flag and flag staff to the company by its employees, as a token of the confidence of the working staff in its employers. George Harrison, who acted as executive officer of the special flag committee, made the presentation speech, while J. W. Stoddard, president of the company, received the gift and made plain his great appreciation of the testimonial of the good wishes of his men. The new concrete building, six stories in height, is shown at the right of the photograph.

Flag Presentation at the New Stoddard-Dayton Building.

The Lurie Boys' Auto That Is Interesting New Yorkers.

A LILLIPUTIAN AIR-COOLED AUTO.

What is probably the smallest gasoline-driven automobile ever built has just been delivered to George and Herbert Lurie, aged 13 and 11 years old respectively, and it is expected that it will soon be seen on New York City streets. It was specially built by A. Halverson to the order of John Lurie, the father of the boys, and when not in use will be exhibited at the salesrooms of the Auto Supply Company, 1733-1737 Broadway. Great pains have been taken to make it as exact a reproduction as possible of the large sized cars in everyday use, so that it is practically a reproduction on a small scale of a high-grade touring car.

Its power plant consists of a four-cylinder, air-cooled, F. N. motor, of which numbers are in use on motorcycles. Its dimensions are 2 inches bore by 2 1-4 inches stroke, and it is equipped with a Bosch high-tension magneto for ignition as well as an up-to-date system of lubrication. Its other specifications likewise conform to those of current practice, such as the pressed-steel frame, artillery wheels, sliding change speed gear, I-beam forward axle, semi-elliptic springs and the like. The tires are Hartfords on Midgley rims and measure 18 by 1 3-4 inches. The wheelbase is 46 inches and the tread 26 inches, while the gasoline tank has a capacity of two gallons of fuel. The car weighs 223 pounds all on, and is said to be capable of 40 miles an hour, though its wheelbase would make this a dangerous speed.

FRANKLIN GREATLY ENLARGES TRUCK DEPT.

SYRACUSE, N. Y., April 27.—In a quiet way, the H. H. Franklin Manufacturing Company has been studying the commercial vehicle problem from a practical standpoint, and as the result of its experiments and inquiries has now undertaken the manufacture of commercial vehicles of the gasoline-driven type on a large scale. "The development of the motor truck and motor vehicle has been slow," said H. H. Franklin, in an interview. "The vehicles have lacked stability and have not been as economical as horses. From the start we have kept a careful record of all operating, repair and maintenance expenses, and now have commercial vehicles more economical than horses. We expect that our commercial car department will give employment to 1,500 additional men inside of three years."

The line of commercial cars that the Franklin company will place on the market for the season of 1909 will comprise a light delivery wagon of 1,000 pounds capacity, suitable for dry goods, grocery and other forms of light work, a 3,000-pound truck for ordinary usage, and a 4,000-pound truck for slightly heavier work. Various forms of bodies will be put on these chassis, so that the line will include hotel buses, ambulances, patrol wagons, and the like. Taxicabs will also be included and the company is now said to be working on an order for these cars for one of the leading New York companies.

A. S. M. E. AND S. A. E. TO MEET AT DETROIT.

The third annual summer meeting of the Society of Automobile Engineers will be held in connection with the semi-annual meeting of the American Society of Mechanical Engineers at Detroit, Mich., June 25-27. The meeting of the latter will open June 23 and end June 26, the dates of the two gatherings overlapping in order that the members of both organizations may have the benefit of papers to be read at each.

The meeting of the automobile engineers will begin Thursday morning, June 25, by attendance at one of the morning sessions of the A. S. M. E., during which a paper on "Clutches, With Special Reference to Automobile Clutches," by Henry Souther, will be read, Mr. Souther being a member of both societies. Some of the other papers prepared by members of the American Society of Mechanical Engineers for reading at the meeting in question, are: "A Method of Checking Conical Pistons for Stress," by Prof. George H. Shepard; "Horsepower, Friction Losses, and Efficiencies of Gas and Oil Engines," by Prof. L. S. Marks; "Some Pitot Tube Studies," by Prof. W. D. Gregory, and "A Journal Friction Measuring Machine," by Henry Hess.

The papers to be read during the sessions of the Society of Automobile Engineers will include studies of oxy-acetylene welding processes, as used in automobile construction, which will be supplemented by an actual demonstration of some of the methods employed; efficiencies of different forms of gearing; storage battery practice; the single motor drive as applied to electric vehicles, and a number of other subjects, the complete program being made public later. Through the courtesy of the A. S. M. E., the members will obtain the benefits of reduced railway rates. The Detroit entertainment committee consists of H. E. Coffin, Henry Ford, Russell Huff, James Herron and Alonzo P. Brush.

HOW AN AUTO REPLACED LOCO.

PECOS, TEX., April 22.—During the recent floods in Texas, the automobile played a prominent part. The Santa Fe railroad lost several bridges, and was left without an engine at Pecos, whereupon W. W. Pitts, of the Pecos Automobile Company, communicated with the general manager of the railroad and offered his aid. Mr. Pitts went to work on a four-cylinder double-chain drive Acme, and converted it into a railroad motor car. He secured push-car wheels and axles, and, by babbitting each end of a two-inch pipe and properly bolting it to the car in place of the regular axles, he turned the trick. He fitted 18-tooth sprockets, by using two pieces of well casing, 6 inches in diameter and 10 inches long. He bolted the sprockets to each rear wheel with six bolts through holes in the sprockets and holes drilled through the wheels. This made a rig that was a temporary railroad car carrying five and six passengers, while the Santa Fe was making temporary repairs. The Acme averaged 25 miles an hour, and at times reached 40. It was fitted with a Rushmore headlight, so it could run at night as well as day.

How an Acme Did Yeoman Railway Passenger Service.

THE REEVES AIR-COOLED BUGGY CHASSIS.

To meet the widespread demand that has arisen on the part of carriage makers and others, for the purely mechanical parts of the popular buggy type of vehicle—that is, the engine, change-speed gear, and transmission—the Reeves Pulley Company, Columbus, Ind., has found it expedient to place on the market a complete chassis of this type, instead of confining its attention to the manufacture of the motors alone, as has hitherto been the case. The power plant consists of one of the Reeves, Model

Side Elevation of the Reeves Complete Air-cooled Buggy Chassis.

N, 10-horsepower, two-cylinder, horizontal-opposed motors, which is used exclusively in this chassis. The cylinders measure 4 by 4 inches, the crankshaft being of hammered steel, turned and ground, and supported on long bearings. Gray iron is used for the crankcase, which has been so designed as to make all the parts of the motor accessible. Die-cast interchangeable bearings, hand-scraped to a true running surface, are employed, while the connecting-rods are of manganese bronze made adjustable on the connecting-rod end.

The distinctive feature of the Reeves chassis is its friction transmission, which is of an exclusive type, though the principle is an old one long utilized in the transmission of power in shops. A set of paper friction pulleys of different sizes is mounted on each end of the engine crankshaft, the smaller one of each set being mounted on a spline so that it may be telescoped into the larger by means of a pedal. Just forward of and below the engine is mounted a countershaft carrying two sets of aluminum friction pulleys. Each end carries a set and acts independently of the other. This countershaft, which is supported on roller bearings, carries the driving sprockets at its outer ends, and is hung in oscillating brackets, so that the aluminum pulleys may be rocked into contact with the engine friction pulleys by means of a hand lever. Two speeds forward are provided, the reverse being obtained by means of two idlers, adapted to be interposed between the pulleys on the engine shaft and the countershaft. From the sprockets carried on the ends of this countershaft, the final drive to the rear wheels is by means of double side chains, as shown. A wheel steer is employed, and the chassis, in other respects, approaches current engineering practice on larger and far more expensive cars.

NEW FACTORY OF WARNER INSTRUMENT CO.

Some idea of the manner in which the demand for speed indicating instruments in general has increased during the past few years, and the Warner Auto-Meter in particular, may be gained from the following description of the new plant which the makers of these instruments—the Warner Instrument Company, Beloit, Wis.—have just completed and are now housed in. This company also makes other small indicating instruments of precision, such as anemometers, tachometers, railway autometers, and the like, and as the demand for these is said to have increased in the same proportion, it is probably not strange that no pains have been spared to make the home of the Warner products one of the most complete and thoroughly equipped industrial establishments west of Chicago.

The buildings were designed and erected by the Trussed Concrete Steel Company, of Detroit, Mich., and are constructed according to the Kahn system of reinforced concrete. The main shop measures 100 by 200 feet and has a saw-tooth roof with ten projections, the vertical sides of which are glazed with prism glass, thus leaving nothing to be desired in the way of lighting. Side windows have also been provided at the benches where the jewelers work, but they have been found unnecessary. The walls and ceiling—in fact, all parts of the interior—are finished in white, including the shafting and pulleys, in order to reflect every possible ray of light. This vast expanse of white wall will be maintained clean by making the factory dustless, as the windows will be kept closed and ventilation effected entirely by means of a blast system, in which every particle of air entering the building is "washed" by being passed through a fine spray of water, the air being warmed or cooled as necessary.

Not the least interesting part of the new plant is the system of shafting employed to drive the machinery. The supports are mounted on channel iron beams fastened to special cast-iron brackets, which were set in proper position in the concrete during the construction of the building. The point of greatest interest about this shafting is that it is all mounted on D. W. F. annular ball-bearings, the efficiency of which in this rôle may be imagined from the fact that one line of shafting 100 feet long and weighing 700 pounds may be turned easily with thumb and finger applied to shaft itself.

View of the New Plant of the Warner Instrument Company, Beloit, Wis.

ENGLISH ROYAL PATENT FOR MICHELIN TIRES.

King Edward VII. of England has just granted the royal patent to the Michelin Tire Company, making that concern official purveyors of tires to the throne, and, incidentally, to the cars in the royal garage. This is a much coveted privilege,

King Edward Entering His Car,
Equipped with Michelins.

as it almost invariably results in the adoption of the article so favored by all the members of the court, the nobility, the near-nobility or aristocracy, and so percolates down the various social strata until its use has become universal among every class whose pocketbooks will stand the strain. In this instance, however, the King and his court have been using Michelin tires extensively for years, and the royal patent is of service merely as an added mark of distinction, and a recognition of services so well performed that the bestowal of the honor was a matter of course.

WINTON DECLARES POLICY FOR NEXT YEAR.

CLEVELAND, April 27.—Alexander Winton, president of the Winton Motor Carriage Company, has just made public a statement to the effect that this company will continue to devote itself exclusively to the manufacture of six-cylinder cars during 1909. This is the first announcement regarding its future policy made by any company thus far, and is especially interesting, owing to the extended controversy that has been going on regarding the merits of the four- and six-cylinder types. "Our company, like other automobile companies, is in business to make what the public wants," said Mr. Winton, "and our experience in the manufacture and sale of the 'Six-Teen-Six' is convincing that every claim of advantage put forth can be demonstrated."

A NEW TYPE OF PACKARD FIVE-SEATER.

A new type of Packard car that has made its appearance is fitted with a special body made of four individual seats and a tiger seat in the rear. It is in reality a combination touring car and runabout. The four passengers are seated in front of the rear axle, and, owing to this distribution of weight, easy riding qualities are claimed for it. It is somewhat lighter than the regular type of Packard touring car.

Latest Type of Packard Body That Will Seat Five.

SPECIALTIES FOR POPULAR RUNABOUTS.

As a rule, the autoist has found that the manufacturer of accessories of various kinds—the many small things of more or less importance that are not a part of the car itself and that are not supplied by the builder, does not cater to the wants of the owner of the low-priced car to any great extent, and that as a rule many such articles are generally designed for high-priced cars. On this account, the Jenkins Specialty Manufacturing Company, Sumter, S. C., is placing on the market a line of specialties designed particularly for the five best selling makes of small cars, the Ford, Cadillac, Maxwell, Reo and Buick. It is a noticeable fact that the man who invests in a car of this kind generally does not make much attempt to keep it as clean and trim-looking as he would if it were a carriage, and it is a matter of common observation that the appearance of the average automobile and that of the horse-drawn vehicle for pleasure use are in strong contrast. To enable the owner of the small car to maintain it in better order in this respect, the makers in question make a specialty of a line of linen slip covers designed to fit the upholstery of any of the cars in question, also top hoods, running boards, inside mud splashers, under curtains, chain boots and the like, the accompanying photograph illustrating a Maxwell runabout fitted with their complete line.

Maxwell Runabout Equipped with Jenkins Specialties.

WESTERN GARAGES ARE FLOURISHING.

DES MOINES, IA., April 25.—Talk of hard times has apparently had little or no effect on the automobile business in this part of the country, for instead of plans of retrenchment for the coming season additional capital is being invested. Work has been completed on quite an ambitious addition to the garage of the Buck Automobile Company, under the supervision of its manager, W. E. Moyer. The new structure has taken the form of an L from the rear of the present building on Mulberry street, extending to Seventh street, which will give a second entrance to, and exit from, the establishment at that end. It measures 60 by 90 feet and is being constructed of brick and fireproof materials throughout, no effort being spared to make it a model of its kind. The present building already affords no less than 8,700 square feet of floor space, and with the addition in question this will be increased to 13,500 square feet. The Buck Auto Company has been handling the Pierce Arrow, Royal Tourist and Oldsmobile lines and recently added to these the Peerless and Cadillac.

Buffalo, N. Y.—A. C. Bidwell, jobber in automobile supplies, is building an absolutely fireproof garage at 72-74 Pine street, this city. The new building contains a number of special features in keeping with the progress and demand for high-class storage and attention to cars.

SELDEN LICENSEES COMBINE TO HAVE ROYALTIES REDUCED

TRENTON, N. J., April 28.—In the action of the Hartford Rubber Works, of Hartford, Conn., against the defunct Electric Vehicle Company, which is pending in the United States Circuit Court for the District of New Jersey, a petition has just been filed by the receivers, Halsey M. Barrett and Henry W. Nichols, "praying its instruction and direction with regard to the making of a new agreement with the members of the Association of Licensed Automobile Manufacturers respecting the payment of royalties required to be made upon licenses granted to them under United States Letters Patent No. 549,160, commonly known as the 'Selden patent,' and the terms under which said payment shall be made."

This is the wording of the preamble of the notice issued by the receivers, but behind it there is an interesting bit of Selden history that has been in the making for some time past. A little less than half way down its second page it reads:

"Prior to the appointment of the receivers, the members of the association had insisted that a modification of the agreements should be made which would result in a substantial reduction of the royalties required to be paid thereunder, and since the appointment of the receivers a *large majority of them have refused to make payment* on any royalties, upon the ground that such royalties were excessive and oppressive."

The italics are ours, but they explain in a few words the cause of the present move. The Selden patent forms one of the chief assets of the Electric Vehicle Company, the affairs of which are now in process of liquidation, and the members of the Licensed association have placed themselves on record as being opposed to paying the debts of the bankrupt concern through the medium of royalties. The Hartford Rubber Works Company is suing the receivers of the concern as one of its chief creditors, and as the only source of income consists of the royalties paid by members of the Licensed association, the complainant's interest in the matter is plain. As a matter of fact, however, this refusal of the licensees to pay further royalties on the old basis is not merely the outgrowth of the failure of the Electric Vehicle Company, but is the culmination of a determined effort of a number of the members of the Licensed association, reports of whose activities in this direction have cropped out more or less frequently during the past year or so. The campaign has been carried on continuously, and the fact of the E. V. Company's insolvency was seized upon as an excellent opportunity to have the

matter settled without further delay. Hence the present petition of the receivers, who find themselves helpless in the premises.

The royalties payable under the Selden patent amount to 11-4 per cent. of the catalogue prices of the cars, except for export, in which case the royalty is one-quarter of one per cent. Of this amount three-fifths went into the treasury of the Electric Vehicle Company, from which Selden himself was reimbursed, the remaining two-fifths going to the Licensed association. To quote further from the petition, which asks a reduction of 20 per cent. in the present schedule: "This proposed agreement, if made, will reduce the royalties required to be paid by the members of the association by 20 per cent., with the further limitation that the royalties to be paid in any one year shall not exceed \$250,000."

But the matter of royalties is not the only thing for which the members of the Licensed association referred to have been working. A unanimous vote of the membership has been required to admit new members in the past, in addition to which the constitution of the association requires that all members admitted shall have been in the business of manufacturing automobiles, at, or prior to, the date of the formation of the association in 1902, thus effectively barring newcomers. It has been the aim of the members in question to have the bars let down, which explains the following excerpt from the petition, where it refers to the proposed new agreement, copies of which are on file at the court, as well as the receivers' offices in Newark, N. J., and Hartford, Conn. This part reads: "It also contains certain modifications of the terms upon which new members of the association may be admitted, and surrenders to the association control of litigation to compel payment of royalties in excess of the maximum annual amount of \$250,000, above referred to."

The contingency of a decision regarding the validity of the Selden patent being handed down in the interim is provided for by the following, referring to the new agreement in question:

"It also provides that should a decree be entered adjudging the Selden patent invalid, the royalty shall, pending an appeal from that decision, be paid to the trustee (the Morton Trust Company, trustee for the bondholders of the E. V. Company), to await the outcome of the appeal.

By an order of the court, granted April 25, a hearing on the petition is set for Monday, May 4, at which the creditors and stockholders of the Electric Vehicle Company may appear to argue for, or against, the granting of the petition.

FOREIGNERS MUST AWAIT THOMAS CAR AT VLADIVOSTOK

BY a decision reached by the promoters of the New York-Paris race, the foreigners now *en route* to Japan and Vladivostok will be compelled to await the arrival of the Thomas car at the latter port, so that all the contestants will again start on an equal basis. Cables have been sent to the ports for which the contestants are bound, informing them of this change of plan, and the entrants have also been notified so that they may instruct their drivers to the same effect.

In the meantime, the E. R. Thomas Motor Company has made a formal demand for the cup. According to the preamble of the latter: "No withdrawal from the race will take place, but the

cup is claimed now on the rules laid down by *Le Matin* at the outset of the contest."

After relating in detail the course taken by the Thomas and the advantages gained, it continues: "The E. R. Thomas Company begs leave herewith to file an earnest protest against the action of these cars in not attempting to comply with the conditions of the race, and claims that, by failure of the others to go to Alaska, it has won the cup offered by *Le Matin*."

In stating that the car will continue, it is particularly specified that no rights to the cup are waived, and that a time allowance of at least 14 days be granted it.

AMENDED NEW JERSEY LAW IS ALREADY IN FORCE

TRENTON, N. J., April 28.—Contrary to the generally prevailing impression that the amendment to the present New Jersey Motor Vehicle law is not to go into effect until June, it is now working as hard as temporary facilities, the lack of official stationery and the new number pads will permit. Receipts for license fees are temporarily acting as licenses, and the holders are at liberty to display the new numbers on any part

of the car they choose until the new pads are issued. A feature unduly oppressive is that requiring that all licenses expiring at any time before January 1, 1909, must be renewed, so that all expire December 31, 1908. More than that, no old law licenses will be transferable at a cost of one dollar, as has formerly been the case, the new owner being required to take out a license as if it were a new car.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Grout Automobile Company, Orange, Mass., is running its factory on full time, and, owing to increasing trade, has largely augmented its force of factory employees.

At the sale of the assets of Leon Rubay, at his former place of business on Broadway, between Fifty-third and Fifty-fourth streets, unusually high prices were obtained, the sale being attended almost exclusively by dealers.

High Point, North Carolina, now has an automobile line pending the construction of a street car line to Mechanicsville, a distance of two miles. W. C. York has purchased a twenty-passenger car for the service.

The Ford Motor Company is making music for the masses by arranging for free distribution of the "Ford March and Two-step," composed by Harry Zickel, a rag-time author of prominence. It is also planned to supply the lines to bands and orchestras and also in the form of records for automatic piano players.

Wyckoff, Church & Partridge, eastern agents for the Stearns, gave a dinner last Saturday night at Rector's, New York, in honor of the three Stearns pilots in the Briarcliff race—Frank Leland, Barney Oldfield and Guy Vaughan. All the local and several of the factory staff attended, including Treasurer Jacobs and Superintendent Patton.

In Denver, Col., fifteen real estate men use Franklin automobiles, and, with but two exceptions, they are Type G. One man writes the Franklin people that his car has paid for itself three times over in one year, and that the real estate business in Denver could not be conducted successfully under modern conditions without the use of autos.

An order for six seven-passenger Rambler cars has been placed with the Chicago branch of Thomas B. Jeffery & Company by the Big Horn Basin Development Company, for use at Cody, Wyo. The latter company is developing 245,000 acres of farm land in Wyoming by irrigation, and will use the cars to carry prospective purchasers to and from the railway station.

"Automobile progress in the West is rapidly gaining on the East," says E. H. Broadwell, of the Fisk Rubber Company. "The beginners there seem to know more about cars, their uses and limitations, than did the average Eastern man with his first car, and this same knowledge is particularly manifest where tires are concerned. Perhaps, in the West, they are profiting by Eastern experience, but whatever the reason, they are forging ahead."

Endeavors are being made to obtain a concession from the Mexican government for a stage line between San Diego, Cal., and Enseñada, Lower California. Byron Hall is backing the project, and if the concession is granted, will establish a line of passenger and freight auto busses, using 75-horsepower machines capable of making the round trip in less than a day. There is no railroad connection between the points in question, the only means of communication existing at present being by steamer, which is very slow, owing to the much greater distance that must necessarily be traveled in going around the coast line.

F. M. Hoblitt, known from coast to coast as a pioneer automobile salesman, and now traveling representative for the American Locomotive automobile, is father of the following expression that is causing considerable discussion. In speaking of the six-cylinder Locomotive car he says: "It possesses energetic mechanical instinct." The argument turns upon whether it is possible for a car to be so perfectly balanced as to warrant saying that it possesses instinct.

"There has never been such development in the same length of time in the product of any industry as has been shown in automobiles," said Hugh Chalmers, president of the E. R. Thomas Detroit Company, recently, in discussing the Thomas policy of entering race meets. "This is due largely to the races and endurance runs that have been conducted. These contests have shown the manufacturers the weak points of their machines, and have enabled them to strengthen their cars and make them more reliable."

Republic tires received a well-merited compliment in a story recently told by Edgar T. Dennis on himself at the automobile club. Before undertaking a 3,000-mile Winter tour through the Appalachian mountains, Mr. Dennis gave instructions to have the tires filled with a puncture-proof compound, and to have the two spares left at home. The driver misunderstood the order, except in so far as the spares were concerned, and Mr. Dennis was surprised on his return home to find that he had been many miles from help, or even a spare tube, for several weeks, and that his self-congratulations on the unexpected resiliency of the tires had been misplaced.

The Locomobile Company of America has just delivered one of its Tye E Locomobiles to Edward Mooney, chief of the Bridgeport (Conn.) fire department for use as a chief's car. A special chemical Locomobile has been in active service in Bridgeport since December last, and since that time has responded to over 100 alarms, and the steamer hose has only been on the hydrants five times in that period. Chief Mooney found that he was never getting to fires until some time after the chemical had extinguished them, and realized the need of superseding his horse conveyance with one more modern and speedier. The Locomobile people have sold a similar car to the South Park Commission of Chicago, for the use of Captain Richards. This car, however, is of the roadster type.

A side light on the expenses of a road like the Briarcliff and the immense amount of detail connected with the running of cars in these events was thrown out by a prominent oil man who visited the scene of the race yesterday. This was W. T. Kincaid, of the Harris Oil Company, of Providence, who went to New York in response to demands on the Isotta and other drivers, who asked that he personally see to the delivery of the oil which they were to use in the race. Mr. Kincaid said that after going the rounds of the training camps, he found that the cars in the race would use at least 500 gallons of oil of various kinds. When it is remembered that oil expense is one of the least of all the expenses of running a

car, some idea of what the race will cost the contestants can be formed. Mr. Kincaid said that much more than 500 gallons would be bought for the race, in order to have extra supplies at the various scattered stations around the course, but that some of this would not be used and a good deal of it would be held over for later use.

NEWS ABOUT THE AGENCIES.

The Garfield Park Automobile Garage, Douglas boulevard and Harrison street, Chicago, has been appointed agent for the Grout car for that city.

The Pueblo Novelty Works has opened an up-to-date garage at 519-521 Court street, Pueblo, Col., and will handle the Rambler, Mitchell, Maxwell and Detroit electric. The new garage is to be run as a branch of the headquarters at 310 North Main street.

That Cleveland is very favorably regarded by the trade at large as a selling point is well illustrated by the way outside manufacturing concerns are opening up agencies there. Last week the Overland invaded the city, placing an agency, while the Knox, American and Overland are now figuring with the local dealers.

The National is now represented in Washington, D. C., by George Wells, who has opened a salesroom and garage at 1333 Fourteenth street, N. W. Lester D. Moore is the latest Washington dealer to locate on Fourteenth street, which is becoming known as the Capital City's automobile row. He will handle the Reo and Premier. Several dealers are bidding for the Oldsmobile agency, heretofore held by John Lutz, who has retired from the business because of ill health.

RECENT TRADE CHANGES.

The Boston branch of Charles F. Kellogg & Company, of Philadelphia, makers of lubricating oils and greases, has moved from 91 Church street to larger quarters in the Motor Mart, at 87 Church street.

PERSONAL TRADE MENTION.

Elmer Apperson announces that he has engaged Herbert Lytle to drive the company's Apperson cars in all races and other contests in which the factory may desire to participate.

Secretary Johnson, of the Automobile Club of St. Paul, was in New York this week looking over the ground as to the chances of securing entries for a big track meet during the Shriners' convention in that city. He enlisted the cooperation of Fred J. Wagner in the matter.

Marcus I. Brock, who was in charge of the sales department of the Autocar Company for three years prior to December, 1905, severing his connection with that concern to become assistant manager of the Association of Licensed Automobile Manufacturers, has just returned to Ardmore, Pa., to again take up his duties in the same position. He will have associated with him in the Autocar sales department H. M. Coale and F. G. Browning, and an active campaign will be immediately undertaken. As Mr. Brock is no stranger to the Autocar, he will have no difficulty in taking up the reins just where he let go.

NEW TRADE PUBLICATIONS.

Bausch & Lomb Optical Company, Rochester, N. Y.—Under the title of a "Triple Alliance in Optics," this firm is sending out an attractive booklet showing how the three foremost investigators in the world of optics—Carl Zeiss, Jena; George N. Saegemuller, and the Bausch & Lomb Optical Company, came to be associated. "The natural drift of scientific and economic tendencies has led to the fusion of the business interests of the Bausch & Lomb Optical Company, the Bausch, Lomb, Saegemuller Company, both of Rochester, and the Carl Zeiss Optical Works, Jena," reads the foreword. "This unification is the practical expression of a desire to concentrate the knowledge, skill, experience, and energy of the leading optical firms of two continents. Under the new régime the Bausch, Lomb, Saegemuller Company becomes an integral part of the Bausch & Lomb Optical Company, losing its identity as a separate corporation. The Zeiss works become members of the new corporate organization, and the intention is to manufacture certain products of the Jena works in the United States." The new concern will be known as the Bausch & Lomb Optical Company.

Pope Manufacturing Company, Hartford, Conn.—One of the most attractive car catalogues of the season is that of the Pope-Hartford cars. It is not only an excellently executed piece of work from a typographical point of view, but it reflects the long experience that the Pope publicity forces have had in catalogue making. It is a 30-page, flexibly bound pamphlet, printed on heavy surfaced paper and strikingly illustrated in colors. This refers more particularly to the different models of the cars themselves, there being numerous other illustrations of parts and departments of the works in half-tone on tinted backgrounds. The motor as well as the other essential parts of the car are illustrated in detail, while their manufacture is described at length. The cover is attractively illustrated by two panels, one showing a party starting out in the morning, and the other, returning at night.

Halsey Auto Company, St. Louis.—What is probably the most effective way of showing second-hand automobiles to prospective purchasers at a distance, takes the form of a catalogue of used automobiles sent out by this firm. It is a work in which the photographer has played a more important part than the printer, as apart from a three-line notice over the signature of O. L. Halsey, president of the company, guaranteeing all cars offered to be exactly as represented, and the briefest possible description of the cars themselves, the photographs are allowed to do their own talking. The cars have been pictured exactly as they stand, without any attempt at making them more attractive than they are by retouching or providing an artistic background. The date of original delivery, make, model, mileage covered and the selling price, as well as the maker's price, comprise the data given below each picture.

Spittdorf Laboratory, 261-265 Walton avenue, New York.—"Automobile and Gas Engine Ignition Apparatus" is the title of a booklet now being sent out by this pioneer house in the manufacture of electrical specialties for the automobile. As Spittdorf has been a name associated with the making of electrical apparatus for half a century past, no superfluous words are wasted in introducing the reader to the subject, so that the entire Spittdorf line, including high and low-tension magnetos, dash coils, the Spittdorf synchronized multi-cylinder coil, motorcycle coils, motorcycle magnetos, Spittdorf timers and spark plugs, switches and the like, as well as illustrations and descriptions of replacement parts for everything listed, is fully covered in a 34-page pamphlet.

Thomas B. Jeffery & Company, Kenosha, Wis.—Rambler automobiles form the subject of catalogue, number 15, just issued by this old and well-known house, and it is certainly a fitting vehicle to carry the Rambler message to thousands of prospective buyers, who are looking for "the car of steady service." Just why the Rambler cars have achieved this title, is fully explained in the greatest detail in connection with the description and illustration of every essential of the car. The story is interestingly told and is enlivened by numerous illustrations of Rambler cars amid many different scenes. The cover bears the name Rambler heavily embossed in red and in the style that has long been a distinguishing feature with this house, while the frontispiece is a Rambler touring car in several colors.

Renault Freres, 1776 Broadway, New York.—Paul Lacroix, general sales manager for the Renault Freres Selling Branch for the United States and Cuba, is now distributing a facsimile of the large catalogue sent out by the home firm, translated into English.

It tells of the numerous achievements that the builders of these cars have to their credit ever since 1899, besides describing in detail the numerous models that they list, ranging from a 9-horsepower, two-cylinder chassis, up to a 50-60-horsepower, six-cylinder machine. The catalogue is attractively printed on good paper and is interestingly illustrated by halftones of numerous scenes on foreign racing courses in which Renault cars figure prominently, beside which there is a number of views of the extensive works at Billancourt, France.

E. R. Thomas Detroit Company, Detroit.—"Thomas-Detroit Doings" is the title of a new periodical which will be issued by this concern henceforth, as a means of extending a helping hand to the hundreds of Thomas agents all over the country. It is a four-page sheet, measuring 9 by 12 inches, and is attractively printed in colors. The doings of the Thomas and the plans of its makers will be chronicled therein weekly, the first two issues being dated April 10 and 17. "Published by the E. R. Thomas Detroit Company to help our agents sell Thomas-Detroit Forty cars" briefly explains its mission.

Motor Car Equipment Company, 55 Warren street, New York.—The 1908 catalogue of this concern, which is the most attractive piece of trade literature of its kind that has been received in some time, is said to contain the most complete variety of automobile supplies listed. It is not the largest book of its kind by any means, but an example of its compactness is to be found in the fact that no less than eighteen different varieties of spark plugs are illustrated and described in two of its 8 by 10-inch pages. As there are 90 pages, equally condensed, the amount of matter contained will be apparent. The index is particularly complete, each article being listed by its accepted trade name, as well as the maker's name and the popularly used term.

Warner Instrument Company, Beloit, Wis.—"The Warner Autometer," surmounting an embossed illustration of the Autometer itself in gilt, which in turn is followed by the legend "Tells how fast and far," forms a catalogue cover that has become familiar. A speedometer is an instrument that comes within the category of "apparatus of precision," and as such requires extremely accurate machinery and painstaking care to manufacture, in addition to which it must be made strong enough to withstand the jars and jolts it receives on an automobile. Just how this is done is told in detail in the Warner Instrument Company's catalogue, the story being interspersed with numerous half-tone illustrations.

Rainier Motor Car Company, New York City.—As the completion of the new Rainier plant at Saginaw, Mich., was effected not long before the issue of the Rainier catalogue for the present season, a description of this latest addition to the country's growing list of modern automobile factories has been appropriately employed in the shape of an introductory to the description of the Rainier models, which follows. Each page carries an illustration of a car, or some part, and is printed on white surrounded by a tint border, while across the top of each page, there is a panel carrying a line sketch showing Rainier cars in familiar settings, the world over.

Barrett Manufacturing Company, New York City.—Another pamphlet from this firm enclosed in a cover adorned by a most attractive view of park roadway, and emblazoned in one corner by the announcement "Tarvia, the dust layer," constitutes the latest addition to the literature of the subject which has recently made its appearance. Its purpose is to describe a new Tarvia treatment, and in doing so, excellent use is made of half-tone illustrations to show a number of specimen stretches of road that have been perfected with Tarvia.

General Automobile Supply Company, New York City.—Automobile accessories and tools of every imaginable nature and at net prices, form the contents of a new catalogue just issued by this firm. Complete lines are handled both at the down-town headquarters at the above address, as well as at the up-town store located at Broadway and Fifty-second street. Every article is illustrated and described in detail, the firm doing a large mail order business. The 1908 catalogue is a 74-page booklet, attractively printed.

Lovell, McConnell Manufacturing Company, Newark, N. J.—This concern is now sending out a booklet describing and illustrating the new "Klaxon" warning signal, of which Miller R. Hutchinson, 1 Madison Square, New York, is the patentee and inventor. The booklet describes the numerous uses to which the "Klaxon" is applicable and makes interesting reading of the process. The "Klaxon" is made in two types, one

mechanical, and the other electrical, and the manner of their application is described in detail.

Mathew Strauss, 707 Main Street, Buffalo, N. Y.—A general line of automobile and gas-lighting supplies and accessories is listed in the 1908 catalogue just being sent out by this house. It is a book of 90 pages, measuring 7 by 10 inches, and contains a showing of all the standard supplies, such as lamps, horns, gas tanks, clocks, tire and robe holders, carburetors, mufflers, force-feed oilers, speedometers, shock absorbers, pumps, windshields, clothing, goggles and the like, in addition to a full line of tools.

Monarch Motor Car Company, Chicago Heights, Ill.—"Monarch 1908" is the cover caption of an attractively written booklet descriptive of the design and construction of the New Monarch car, which is being built by this firm. The entire 28 pages are given over to a detailed showing of every essential of the car, most of them being illustrated by half-tones, in addition to which there are a number of line sketches, showing the motor and change-speed gear in section, and the forward half of the chassis in plan.

Joseph Dixon Crucible Company, Jersey City, N. J.—Autoists are never permitted to forget the fact that Dixon's graphite lubricants are on deck. Their latest arguments in favor of this method of lubrication are contained in two booklets, one of which is devoted to graphite lubrication of automobile gear boxes and transmissions and the other a compilation of "Questions and Answers on Automobile Lubrication," the cover bearing a sketch of the Sphinx with an auto in the foreground.

Canada Cycle & Motor Company, Toronto Junction, Ont.—This concern builds the Russell car and is now sending out an attractive catalogue describing the models being turned out for 1908. It is an 8 by 10, 28-page pamphlet, which is very attractively gotten up from a typographical point of view, and is devoted entirely to the business of showing how the Russell cars are made and what is used in their construction.

Detroit Lamp Company, Detroit, Mich.—Fourteen different lines in automobile search-lights, side lights and tail lamps are comprised in the Detroit company's catalogue for 1908. Each type of lamp is illustrated by half-tone engravings.

A LIVE MOTORCYCLE AGENT.

John T. Fisher, the veteran cyclist, who is now manager of the Chicago branch of the Hendee Manufacturing Company, of Springfield, Mass., makers of the Indian motorcycles, is a firm believer in the future of the power-driven two-wheeler. During the recent carnival in Chicago, the Indian headquarters, at 1251 Michigan avenue, were decorated, and Mr. Fisher was a prominent figure in the parade. A largely increased demand for motorcycles is a feature of this season's trade.

John T. Fisher.

INFORMATION FOR AUTO USERS

L. & M. Specialties.—Among the accessory specialties manufactured by the Long & Mann Company, Rochester, N. Y., for the automobile trade are the "Minute" adjuster to facilitate the removal and replacement of clincher tires, and which has

L. & M. TIRE SHOE LIFTER.

now been made so as to fit in any tool box; the "L. & M." Adjusters, designed to be used in connection with quick detachable tires and removable rims, and which are said to be the only tools made for use in connection with these tires. The

sponge washer in that the sponge used is made of cotton mop yarn, and is in fact, a mechanical sponge. It is so constructed that the water cannot escape in the form of a stream at any point, but is very evenly distributed, while it also checks any excess pressure of the water supply and is thus economical with water, as well as in first cost.

Mather Dismountable Rim.—This is a new type of demountable rim that is the invention of Frederick R. Mather, of Wellsville, N. Y. The wheel shown in the accompanying illustration has been run several hundred miles and has stood every test most successfully. It is merely an old wood wheel cut down and fitted with the inventor's attachments, the latter's design calling for a tubular steel spoked wheel of neat design and appearance, and which

MATHER RIM AND GENERAL DETAILS.

will embody several improvements not shown on the model. As will be evident from the cut, this new type of demountable rim is simple and strong in construction, making it very durable, while it is also easy to operate. In fact, it represents one of the quickest methods of changing tires on the road. The Mather rim and wheel were shown for the first time at the recent Buffalo automobile show, where they attracted considerable favorable attention. It is expected to place them on the market during the present season.

L. & M. TIRE SHOE LOOSENER.

"L. & M." Tire Shoe lifter is a new and simple tool and is designed as an adjunct to the "Minute" outfit, while the Tire Shoe loosener recently brought out is distinctly new and different from any other tool on the market, both in action and efficiency,

"PERFECT" AUTO AND CARRIAGE WASHER.

and is not only a necessity to every autoist, but to every garage and repair shop as well. The "Perfect" auto and carriage washer is also new, and represents an improvement over the ordinary type of

Cleveland-Canton Auto Springs.—The manufacture of springs for automobile suspension is a branch of the industry that has been developed along specialized lines, probably more than any other that has to do with the making of parts of the car. In fact, it has been brought to a point where it may well be compared to the making of watch-springs. One of the firms that has been responsible in large measure for this trend of development is the Cleveland-Canton Spring Company, Canton, O. Every possible combination of steels and alloys has been tried out to get just the right materials for successfully meeting the unusual requirements of automobile work, and this company has demonstrated the fact that while there are thousands of possible combinations of steels, that only a few can be successfully used in the manufacture of automobile springs, and an attractive booklet they have just issued, explains in simple language just why this is so, thus making it a piece of advertising literature

that will be of equal interest to owner and manufacturer alike. They also illustrate a number of the various types of springs commonly used on automobiles, such as the full-elliptic, button head; semi-elliptic, scroll-end elliptic, double-scroll, three-point suspensions, commercial vehicle suspensions and the like.

"Three Ball" Gasoline Tester.—One of the greatest disadvantages of the usual type of gasoline tester or hydrometer has been that a special containing vessel was necessary to hold the latter. To overcome this, the Storage Battery Supply Company, 239 East Twenty-seventh street, New York City, have brought out an ingenious instrument, termed the "Three Ball" gasoline tester, which is shown in the accompanying illustration. By dropping this device into the tank, barrel or can of fuel to be tested and withdrawing it, the specific gravity of the gasoline may be seen at a glance. The balls are red, white and blue, and each one sinks or floats according to the character of the liquid. The instrument will pass through a 3-4-inch hole, and requires only 1-4 ounce of gasoline to fill it, while the whole instrument is so small that it can readily be carried in the waistcoat pocket.

PATENTED 1906.
THREE BALL TESTER.

Torbensen Motors.—With a view to producing a motor that would work all day and every day, with a minimum of trouble, the Torbensen Motor Car Company, Bloomfield, N. J., has brought out a line of air-cooled, double opposed, horizontal, four-cycle motors. They are made in two sizes, 4 3-8-inch bore by 4-inch stroke, rated at 12-horsepower, and 5 1-8-inch bore by 4 1-2-inch stroke, rated at 18-horsepower. Both are given a perfect running balance, while all bearings are of large size, the crankshafts being one-piece drop-forgings, ground on the journals, while the connecting rods are also drop-forgings of the same material. The cams and rollers are of tool-steel, hardened, while the bearings are of white brass, the main journals of the 18-horsepower motor measuring 1 3-4 inches diameter by 3 1-4 inches long, while the smaller motor has 1 5-8 by 3-inch journals. The cylinders

TORBENSEN AIR-COOLED HORIZONTAL MOTOR.

are offset so that they are directly in line with the cranks. The lubrication of all wearing parts has been worked out in the most efficient manner, while every part of the motors is made to standard gage and is interchangeable to facilitate replacements. The 12-horsepower motor is suitable for high-wheelers and light runabouts, while the larger motor is adapted for higher-powered runabouts, light touring cars and delivery wagons up to 1,500

pounds capacity. They can be made to run in either direction and their normal speed is 1,200 r.p.m. They are listed complete with carbureters, intake manifolds, spark timers, plugs, fan, oil connections and the like.

Borbein Special Bodies.—The Borbein Auto Company, 2109-2111 North Ninth street, St. Louis, have added two specialties in the shape of a complete automobile

speed-gear, final drive being by propeller shaft, while all essentials of the entire transmission are exactly in line. The front axle is of the tubular type, with Timken roller-bearings, while a live rear-axle of the floating type is employed. Suspension is by means of full elliptic springs in the rear and semi-elliptics front. The wheelbase is 106 inches and the tread standard, while the complete car tips the scales at 1,900 pounds. One of the features of the car that the

ing driven from an extension of the pump shaft. This arrangement requires the use of but three gears, thus reducing noise from that cause to a minimum. The magneto may be taken off simply by removing a single set screw and the pump is also easily removable for inspection and repair. The valve-operating mechanism is extremely simple, the plungers being of the mushroom type, and these, as well as the cams, which are integral with their shaft, being hardened and carefully ground to size. The valve timing is accurately inscribed on the flywheel periphery as a guide for retiming. Both the connecting rods and crankshaft are drop forgings of high-grade steel, the bearings and bushings being of the best white bronze. A special feature of the new motor is its automatic lubricating system, consisting of a constant oil level in the crankcase for splash oiling with an overflow to a well, from which a small gear pump driven from the timer shaft lifts the oil and forces it into the crankcase proper, thus making a constant circulation. The cylinder dimensions are 4 1-4 by 4 1-2 inches and the rating is 24-28 horsepower. The weight complete is 360 pounds.

BORBEIN NO. 25 AMBULANCE BODY, WITH SPECIAL VENTILATION.

ambulance body and a roadster type to their already extensive line of running gears and bodies for the season of 1908. The ambulance is a special design and represents rather a radical departure from

makers call particular attention to, is the ability to start on the high speed without any difficulty, owing to the use of a multiple disc transmission. Several types are made, including the Model A touring car, gentle-

Fisher Storage Battery Charger.—It is a well-established fact that the storage battery furnishes the best possible source of ignition current, and if it were not for the constant necessity of removing the battery to recharge it, this would form the ideal type of high tension ignition. To overcome this inconvenience, the A. W. Fisher Company, South Bend, Ind., have brought out their Fisher automatic storage battery charger, designed to automatically maintain the batteries of a car fully charged at all times. It is the invention of a gas engine expert who has had 20 years' experience in this field, and it is fully covered by patents. The generator may be either friction or belt driven and may be readily installed anywhere near the engine. The amount of current drawn from the batteries for ignition service is automatically replenished by the generator which supplies current to the batteries as long as the engine is running. In order to prevent the battery discharging through the generator when the engine is stopped, an automatic circuit breaker, or cut-out, is provided. This opens the circuit, the moment the engine speed drops to a point where the generator ceases to supply current to the battery, and immediately closes the circuit again on the resumption of normal speed, or the restarting of the engine after it has been idle. The device is entirely mechanical and thus positive in action. It provides a means of enjoying the reliability and plentiful supply of current given by the storage battery without the disadvantage of frequently having to recharge the latter.

BORBEIN NO. 35 SEMI-RACING TYPE CAR READY FOR POWER.

hitherto accepted standards in this respect, over which it is quite an improvement. For instance, ventilation is specially provided for by a row of three narrow panel openings on each side along the upper edge of the sides of the body, while the driver is protected by a glass windshield and light is admitted to the interior of the body by means of a large pane occupying the entire space above the upholstery of the driver's seat. The special 1908 roadster is of the semi-racing type, in which seats are placed at the extreme rear of the chassis, the seating capacity being limited to two. It is known as Borbein car No. 35, and consists of a running gear and body complete and ready for the power.

men's roadster, Model C runabout, Medium touring car, and a six-cylinder, 60-horsepower touring car.

Continental Self-Oiling Motor.—Under the title of Model K, the Continental Motor Manufacturing Company, Muskegon, Mich., is just placing on the market a simplified type of four-cylinder vertical motor. It embodies all the excellent features of design of previous models of the Continental motors, but has been designed particularly with a view to producing a motor having the least number of parts and which shall be as durable, efficient and economical as possible. The cylinders are offset, the valves all being placed on the right side, where the carbureter, timer and magneto are also located, the magneto be-

OUTLINE SIDE AND END VIEW OF CONTINENTAL MODEL K.

The Fuller Car.—This is a brand new comer in the field, that hails from Angus, Neb., a place close to the geographical center of the United States. It is being made by the Angus Automobile Company, and while an assembled car, in large measure, incorporates a number of exclusive features. Its power plant consists of a four-cylinder Rutenber motor rated at 35-40 horsepower, and coupled by means of a three-jaw clutch to a special type of change

THE AUTOMOBILE

HARRISBURG RUN'S BIG PRIZE WON BY A STEAMER

HARRISBURG, Pa., May 6.—At 2 o'clock this morning, after seven hours' hard work, the technical committee of the Motor Club of Harrisburg decided that the White, driven by Walter White, had won the Class A cup in the club's second annual endurance run with a perfect score. The win carries with it a victory in the run-off of last year's tie—the first double-headed triumph in the annals of automobiling. When the extremely critical examination is taken into consideration, the victory is all the more creditable.

Before arriving at their verdict, each of the even-score cars turned over to the committee was tested on a nearby hill for brake efficiency; clutches were tested by putting front wheels against a high curb to see if the rear wheels would spin; both ignition systems were gone over; transmissions were tried for defects in gear working; every wheel, axle, spring, frame, motor, and gear-set was examined; every bolt, nut, and pin was gone

over. Nothing was overlooked. The car that survived such a critical test deserved a victory, be its road demerits ever so many. As a matter of fact, they were few and far between.

In the big runabout class the Pullman went through the exacting scrutiny with the smallest number of penalty points, and Harry Croninger's Pennsylvania had only five points more.

The committee were so tired after cleaning up Classes A and C that they knocked off for the night, and will finish after breakfast.

The figures for the two days, as far as completed, are:

Class A—Touring Cars Costing \$2,250 and Over.

No.	Car	H.P.	Driver	Road Pen.	Tech. Pen.	Total
28	White	30	Walter White.....	0	0	0
18	Thomas	60	Fred Moselein.....	0	15	15
5	Pullman	40	Robert Morton.....	65	0	65
10	Stoddard-Dayton.....	45	R. Shirk.....	69	0	69

General View in Reading, Where the Contestants Checked on the First Day of the Endurance Run.

Class C—Runabouts Costing \$2,000 and Over.

No.	Car	H.P.	Driver	Road Pen.	Tech. Pen.	Total
8	Pullman	40	Stuart Lafean	0	6	6
27	Pennsylvania	50	R. H. Croninger	0	11	11
25	Rambler	32	A. H. Bitner	0	17	17
17	Appraon	50	C. J. Swain	13	5	18
4	Pullman	40	E. G. Irvin	9	51	60

The observers' reports showed that the penalties accumulated by cars of Classes B and D for work on the road, engine stops, and breaking seals on those cars turned over to the technical committee are as follows:

Class B—Touring Cars Costing Less Than \$2,250.

No.	Car	H.P.	Driver	Cause	Points
19	Maxwell	24	Charles Fleming	Oiling	2
21	Maxwell	20	Andrew Bender	Adjusting roller	2
23	Cadillac	20-25	C. C. Crispin	Broken spring	4
6	Pullman	20	Max Graupner	Oiling, 6; spark plugs, 8; seals, 5	19

Class D—Runabouts Costing Under \$2,000.

No.	Car	H.P.	Driver	Cause	Points
12	Pullman	20	C. C. Cumbler		0
20	Maxwell	20	John Sellers		0
22	Mitchell	35	W. M. Cram		0
9	Pullman	20	C. C. Cocklin	Oiling, 10; fender, 10; battery, 4; seals, 5	29
24	Ford	15-18	A. A. Jones	Ignition, 70; stop, 158; seals, 15	243

The checkers' figures have not as yet been analyzed, and some of the above cars will have a few more points chalked up against

Walter White at Wheel of Steam Winner.

them for lateness at controls, but, generally speaking, few of the contestants suffered from this cause. Four cars were not turned over to the technical committee, and these also will have to be added.

What Happened on the First Day.

PHILADELPHIA, May 4.—The first day's summing up of the performances of the twenty-six cars that started this morning in the two-day endurance run of the Motor Club of Harrisburg shows that eleven have clean scores up to date. Five others are in a mix-up with the checker at Easton, his records showing that they checked in ahead of time. The matter is in abeyance, and the quintet may satisfy the contest committee that they did not fracture the rules. All but one of the twenty-six cars are still in the run, the Stoddard-Dayton, driven by Howard Hodson, having been put *hors de combat* by smashing up while coming into Doylestown.

Among the immaculates up to date are three Class A's, two B's, four C's, and two D's, the latter pair being J. S. Trego's Jackson and A. A. Jones' Ford. These little fellows performed their task like veterans, and asked no favors of their high-powered rivals. Arthur Kumpf and Walter White are still clean, and will bend every effort to capture the 1907 cup, which was tied up with four clean scores. One of these did not start, the other, the Pullman, driven by "Bob" Morton, collected sixty-one bad marks on the road to-day.

The start was made at 7:30, under a leaden sky, which spat rain at intervals and drove the travelers to oilskins and rubber coats. It was but a flash in the pan, however, and the weather man handed out a fair article, barring the bleak southeast wind, which persisted throughout the day. Road conditions were as good as they can be over the route selected, lots of alleged road repairing being in progress for miles out of Harrisburg, which "dragged" the contestants badly. The eighty minutes proved more than enough, however, to allow all but C. C. Cocklin's Pullman No. 9 to get under cover of the Lebanon control safely. A broken water connection delayed him twenty-five minutes. After that it was well within the powers of an average car and driver to make the controls, even the much-dreaded Reading-Allentown leg and the Easton-Doylestown, which proved fatal to the hopes of so many Quakers last New Year's Day, being negotiated with ease by the majority of the cars. The schedule was liberally sprinkled with "danger" warnings all along the two controls, but nothing untoward happened until A. J. Hamilton's Stoddard-Dayton No. 11 skidded on rounding a curve, and was temporarily put out of the running. Neither Hamilton nor his driver, Howard Hudson, was hurt.

Tire troubles were not unreasonably frequent during the run, the greatest sufferer in this respect being the 1905 Franklin-20, which the Central Pennsylvania Automobile Company loaned the committee for the purpose. Fully a dozen punctures were suffered by the pressmen's car, and it fell so far behind that it became necessary to cut the course, running direct from Reading to Philadelphia, and at that the car was not garaged until after 6:30.

The first car to show up at to-day's finish was E. G. Irvin's Class C Pullman, which arrived at the White garage on the dot at 4 o'clock, twenty minutes ahead of time. J. S. Trego's Class D Jackson followed a few minutes later, and then there was an interval of ten minutes before another car materialized, but it was the head of a procession. By 4:30 the majority of the cars were in the control, waiting to be checked out. They are under lock and key to-night, guarded by special watchmen.

Following is the schedule, showing the distances and time allowances for the first day:

	Distance	Total Distance	TIME
Harrisburg to Lebanon	26.4	26.4	1:30:00
Lebanon to Reading	29.8	56.2	1:30:00
Reading to Allentown	37	93.2	1:50:00
Allentown to Easton	23	116.2	1:10:00
Easton to Doylestown	32.4	148.6	1:35:00
Doylestown to Philadelphia	26.1	174.7	1:25:00

The controls for the first day were established at the *Patriot* office, Harrisburg; the Eagle House, Lebanon; Mansion House, Reading; Allen House, Allentown; Soldiers' Monument, Easton; Monument House, Doylestown, and the White garage, Philadelphia.

Makers Considered Run Most Important.

That the manufacturers were "hep" to the advertising value of a win in this run was manifest by the array of crack drivers who lined up for the contest. In Class A there were Walter White; Arthur Kumpf, who drove Herbert F. Rawll's Pierce Great Arrow, and won his spurs in last year's Glidden, being the youngest driver on that tour, and Robert Morton, who won the Philadelphia-Savannah race in his Pullman against the Studebaker. White, Kumpf, and Morton were the three double-prize drivers. "Bob" Shirk, who drove the Stoddard-Dayton, has registered many wins. Charlie Fleming came on from the Tarrytown factory to drive Andrew Redmond's Maxwell in Class B. Harry Croninger, general manager of the Pennsylvania Automobile Company, drove his Pennsylvania in Class C. A. H. Bitner, a Rambler crack, who scores frequently, was at the wheel of one of the Ramblers in the same class.

The rules provided for four classes—A, touring cars catalogued at \$2,250 and over; B, touring cars under \$2,250; C, runabouts catalogued at \$2,000 and over; D, runabouts under \$2,000.

An interesting feature of the run was the fierce fight in Class A to win last year's cup, which was held up by the committee

owing to the four clean scorers being unable to come to an agreement as to its final disposition. It will be recalled that the contest committee on that occasion decided to have the run-off take place this year, and all four promised to enter. All but one did so—Walter White's White steamer, E. G. Irvin's Pullman, and Herbert F. Rawll's Pierce Great Arrow showing up at the start, the Thomas of S. K. Hamburger being the only absentee of the quartet, he having waived his claim to the cup.

The official cars made quite a respectable show by themselves. There were no less than eight of them, including Referee R. H. Johnston's White; O. C. Robertson's White, pilot; H. P. Young's Franklin, first patrol; H. M. Cumbler's Pullman, second patrol; Central Pennsylvania Automobile Company's Franklin, press; H. A. Moyer's Rambler, H. C. Wright's Maxwell, and the Harrisburg Automobile Company's Stanley steamer, officials' cars.

All the contestants were required to report at the Keystone Garage, Harrisburg, between 3 and 8 P. M., Sunday, where they were sealed and placed under guard until the start.

The Harrisburgers are boosting Beecroft as an up-to-the-handle technical committeeman. When he arrived at the State capital at 1 o'clock Sunday afternoon, he found that none of his confreres had reported. He didn't wait for them, but annexed a jumper and a pair of overalls and climbed in, over, around, through, and under every car turned in by a competitor, making note of all defects and shortcomings. He was on the job until long after midnight, the other committeemen having turned up later and helped him out a little. Up bright and early in the morning, he gave each car a supplementary examination, noting wheel alignments, listening to cylinder popping, and "getting on" to anything he may have overlooked the night before. Beecroft was surely a revelation to the Harrisburgers.

Details of the Second Day.

HARRISBURG, PA., May 5.—The conditions to-day were even better than yesterday, a bright sun, tempered by a cool breeze, making the sport more of a pleasure party. The schedule was a trifle fast for some of the smaller fellows, but unless in case of accident, the 20-miles-an-hour limit, on which it was based, proved not too severe.

When the twenty-four remaining cars checked out of the White garage in Philadelphia there was a great scurrying for gasoline, while the rapid clank of tire tools was evident on all sides. It was a case of rush, for all time consumed in these necessary operations came out of the seventy-five minutes allowed to cover the 22.2 miles to Norristown. The quick work of the contestants was marveled at by a crowd of several thousand persons, which had to be kept in place by the police.

Poor police arrangements were the cause of an accident in the Reading control to-day. Cars Nos. 1 and 3 were moving to the front to take the word. They were traveling at a gait not faster than 10 miles an hour when an eighty-year-old man, one of a crowd of a thousand or more which blocked the street in front of the Mansion House, was knocked down, and, it is said, seriously injured. The drivers, R. H. Hagerling and Chester Smith, were arrested, but later released when they put up a cash bond. Neither car had clean-scored yesterday and the mix-up with the authorities, which netted them disqualification according to the rules, did not affect their standing.

The Stoddard-Dayton entries, which created such a furore here last year, had extremely hard luck. The Class C car was put out yesterday by a smashed wheel, and to-day "Bob" Shirk could not get the motor going on the Class A entry. He fumed and sweated at the White garage for a trifle over an hour after being given the word, but when he got going he drove to such purpose that at Reading, sixty miles, he was only five minutes behind his schedule. The remaining controls he negotiated ahead of time.

Several clean scores of yesterday were eliminated to-day, chief among which was the Pierce Arrow, driven by Arthur Kumpf. Just after leaving Columbia the Arrow's differential broke, penalizing it both on road and technical bases, and leaving the White sole clean-scorer in the triangular fight for the 1907 cup. Every-

J. A. Kline's Pullman, Which Scored in Big Runabouts.

body was pulling for the Arrow, for it carried the only lady on the run—Miss Anita Baker, of Harrisburg.

No. 23, S. Thorley's Class B Cadillac, went into the road penalty column through the medium of a broken spring. No. 2, J. S. Trego's Jackson, lost its "o" when the ring locking its left rear tire snapped and went flying into the field at the side of the road. Trego sent back eleven miles to Philadelphia for a new one and came in through the rain long after the officials had gone to supper. A. A. Jones' little Ford developed battery troubles while yet within the Philadelphia limits, and lost an hour ere a 'phone message brought him relief. He "beat it" in pursuit of the run after getting things straightened out, and reported at the finish five minutes ahead of time.

E. G. Irvin's big Class C Pullman, No. 4, which was the first car into every control on both days, and had a clean road score all but made, fell from grace ten miles from the home stake. The hose connecting the water jacket and cooler slipped off, and the engine began to heat up. To get at the trouble it became necessary to break the seal and raise the bonnet.

The mix-up yesterday at Easton over the checker having ordered four of the contestants off before their scheduled time was ignored by the committee, and the demerits tacked on the Stoddard-Dayton for opening the hood to oil the cylinders were removed. The schedule showing second day's run follows:

	Dist.	Total Dist.	Time
Philadelphia to Norristown.....	22.2		1:15
Norristown to Reading.....	37.8	60	1:45
Reading to Lancaster.....	33.6	98.6	1:35
Lancaster to Mount Joy.....	25.1	118.7	1:15
Mount Joy to Harrisburg.....	24	142.7	1:10

The intermediate controls were at the Hotel Montgomery, Norristown; Mansion House, Reading; County National Bank, Lancaster, and Washington House, Mount Joy.

Thomas Flyer, Second in Big Touring Car Class.

A. A. A. TOUR PATHFINDER ON THE WAY

BUFFALO, May 4.—The pathfinder in the annual endurance contest of the American Automobile Association for Glidden trophy and Hower trophy for runabouts left Buffalo last Friday to blaze the trail between Buffalo and Saratoga Springs, after the roundabout journey which will cover the 1908 route. The machine is a 50-horsepower Premier, and carried this inscription on the hood, "Official Pathfinder 1908, A. A. A. Tour." When the car left this city it carried Dai H. Lewis, secretary of

Official A. A. A. Premier Pathfinder Leaving Buffalo.

the touring board, who is the official mapper; Ray McNamara, driver; Leon M. Bradley, of the A. M. C. M. A., and photographer Lazarnick.

Mr. Lewis said he expected to have the route completely planned within three weeks. He anticipates some rough places, but is of the opinion that this year's route will not call for so many severe trials as have bothered the drivers in the Glidden tours of the past. It is the expectation that some better roads will be met. Secretary Lewis' car will be the confetti car to

head the tour, which will start from this city July 9. Mr. Lewis achieved an excellent reputation in this capacity last year.

Pathfinders Sidestep Philadelphia.

PITTSBURG, May 4.—Secretary Dai H. Lewis, of the A. A. A. Touring Board, and his associate pathfinders, have completed their task of laying out the route of the annual reliability test from Buffalo as far as this city. They have tarried here several days, wrestling with the problem of how to include Philadelphia in the route and at the same time cut out from the itinerary every foot of the unfriendly soil of New Jersey. The pathfinders have so far proved unequal to the solution of the problem, and have practically determined to give the City of Brotherly Love the go-by. Accordingly, they propose to lay their course to Bedford Springs, via Export and Blairsville, which will cut out the run over the National turnpike by way of Greensburg, originally contemplated. From Bedford Springs, they plan to go to Harrisburg, and then cut across Northeastern Pennsylvania to Albany, then down the east bank of the Hudson river to New York City. From New York, it is the intention to partially retrace their tracks, and strike east into New England, to Boston, whence they will reach the terminus of the run at Saratoga, touring a part of the White Mountain district en route.

[The pathfinders should do a lot of figuring, and think many more times than twice, before sidestepping Philadelphia, one of the greatest automobile centers in the country, and the home of one of the largest and most loyal A. A. A. clubs. R. H. Johnston recently laid out a two-days' run of 225 miles between Philadelphia and New York, which took in the Delaware Water Gap, and dodged New Jersey utterly. Following this route, there would be a ninety-mile run to the Gap, where three big hotels would afford accommodation over night. This would leave for the morrow a 135-mile run to New York by way of Port Jervis and the ferry to Tarrytown at Nyack.—Ed.]

A. M. C. M. A. MAY JOIN CHICAGO CLUB IN SHOW.

CHICAGO, May 4.—The board of managers of the Chicago Automobile Club will meet Thursday to consider a letter from Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, in which the writer intimates that the independents would not be at all averse to joining forces with the local clubs and promoting a second big show in Chicago next winter. Mr. Reeves asks the club what it could furnish in the buildings line, and adds there is little likelihood of the traveling show being run in the fall because of lack of time.

STRAIGHTAWAY LONG ISLAND RACING.

There is every promise of a big and noteworthy meet evolving from the straightaway time trials to be run June 5 on Hillside avenue, Jamaica, Long Island, in connection with the subway opening celebration. The three-mile course will be oiled, fenced, and guarded by police. The contests, which will all be speed trials, will begin at 1 o'clock and be preceded by an automobile parade starting two hours earlier.

The meet will be in charge of the automobile race committee of the Long Island subway celebration committee, of which John Niederstein, County Clerk for Queens, is chairman. The secretary of the committee is Joseph M. Gray, Jamaica, and the assistant secretary is Fred J. Wagner, 29 West Forty-second street, New York, who will have charge of entries and other general work in connection with the event. The race committee will have the assistance of the contest committee of the Long Island Automobile Club, which is made up of A. R. Pardington, chairman; F. D. Bandell, C. G. Arnold, and Russell A. Field, secretary.

WOMEN TO BE TRANSCONTINENTALISTS.

There have been all kinds of transcontinental auto trips in the past few years, but it has remained for Mrs. E. E. Teape and Mrs. Vera McKelvie, her daughter, of Sand Point, Idaho, to be the first women to undertake the 4,000 miles intervening between Portland, Me., and Portland, Ore. They will leave Portland, Me., May 14, unhampered by assistants or luggage other than the necessary wearing apparel, and will make the trip with a Waltham-Orient by easy stages, going via Boston, Albany, Buffalo, Chicago, Des Moines, Omaha, Cheyenne, Salt Lake City, Ogden, Boise, and Baker City to Portland.
